MONTCLAIR, a town of Essex county, New Jersey, U.S.A., 5 m. N.N.W. of Newark. Pop. (1910 census) 21,350. It is served by the Erie and the Delaware, Lackawanna & Western railways, and by electric lines to Caldwell and Newark. It is situated at the base and on the slopes of the Orange Mountains (its altitude above the sea varying from 217 to about 665 ft.), has an irregular street plan, and is a residential suburb of New York and other neighbouring cities. Montclair has excellent public schools. Among the town's institutions are the Montclair hospital, a state normal school (1908), Montclair academy (1885), a public library, and two orphan asylums.

Montclair's first fair festival was held here in June 1905. The lower part of Montclair was settled about 1675 and gradually became known as Cranetown, which name it retained until 1812. In that year Bloomfield, including Cranetown, was organized as a separate township. In 1868 Cranetown, then popularly known as West Bloomfield, with the addition of the Dutch-settled Speertown, was incorporated as Montclair. Montclair became a town in 1894.

MONT-DE-MARSA, a town of south-west France, capital of the department of Landes at the confluence of the Midou and the Douze, 92 m. S. of Bordeaux on the Southern railway between Morcenx and Tarbes. Pop. (1906), 9659. Most of the buildings are in the older quarter, on the peninsula between the two rivers forming the Midouze. La Pépinière, a beautiful public garden, extends along the right bank of the Douze. A keep of the 14th century, now used for military purposes, was built by Gaston Phoebus, count of Foix, to overawe the inhabitants, and goes by the name of Nou-li-Bos (in modern French "Tu ne l'y veux pas"). The finest of the modern buildings is an officers' club, which contains a small museum. A court of assizes sits in the town; the local institutions comprise a tribunal of first instance, a branch of the Bank of France, and a lycée. The industries include distillation of turpentine and resinous oils, tanning, the founding and forging of metal, wood-sawing, and manufactures of machinery and straw envelopes for bottles. There is trade in resin, wine, brandy, timber, cattle, horses and other live stock.

Mont-de-Marsan, the first of the Bastides (q.v.) of the middle ages, dates from 1241, when it was founded by Pierre, vicomte de Marsan, as the capital of his territory. In the 13th century it passed to the viscounts of Béarn, but the harsh rule of Gaston Phoebus and some of his successors induced the people to favour the English. The territory was united to the French Crown on the accession of Henry IV.

MONTDIDIER, a town of northern France, capital of an arrondissement in the department of Somme, 23 m. S.E. of Amiens. It lies on the right bank of the Don, dates from the Merovingian period, and perhaps owes its name to the imprisonment of the Lombard king Didier in the 8th century. The church of St Pierre, dating chiefly from the 15th century, has a beautiful portal of the 16th century and contains the tomb of Raoul III., count of Crépy (12th century), fonts of the 11th century and other works of art. The church of St Sépulcre belongs, with the exception of the modern portal, to the 15th and 16th centuries. In the interior there is a well-known "Holy Sepulchre" of the
latter period. The law-court, once the castle, partly dating from the 13th century, possesses fine tapestries of the 17th century. A statue commemorates the birth at Montdidier of Antoine Parmentier (1737-1813), with whose name are connected the beginnings of potato-culture in France. The town has a sub-prefecture and a tribunal of first instance; its industries include tanning and the manufacture of zinc-white.

Held first by its own lords, afterwards by the counts of Crépy and Valois, Montdidier passed to the Crown in the 12th century, at the end of which it was granted a charter of liberties. The town offered a brave and successful resistance to the Spanish troops of Fawkes (1655).

**MONTE-DORE-LES-BAINS**, a watering-place of central France in the department of Puy-de-Dôme, situated at a height of 3440 ft., on the right bank of the Dordogne not far from its source, and 31 m. by road S.W. of Clermont-Ferrand. Pop. (1906), 1677. The Monts Dore close the valley towards the south. The thermal springs of Mont Dore, now numbering twelve, were known to the Romans. Bicarbonate of soda, iron and arsenic are the principal ingredients of the waters, which are used both for drinking and bathing, baths of high temperature being characteristic of the treatment; they are efficacious in rheumatic complaint, from which the name of the water is derived, and nervous and rheumatic paralysis. From the elevation and exposure of the valley, the climate of Mont-Dore-les-Bains is severe, and the season only lasts from the 15th of June to the 15th of September. The bath-house was rebuilt in 1851-1854. In the “park,” along the Dordogne, relics from the old Roman baths have been collected. The surrounding country, with its fine woods, pastures, waterfalls and mountains, is very attractive. To the south is the Puy de Sancy (6188 ft.), the loftiest peak of central France.

**MONTEAGLE, THOMAS SPRING-RICE, 1st Baron (1790-1866), English statesman, son of S. E. Rice and Catherine Spring, came of a Limerick family, whose ancestor was Sir Stephen Rice (1637-1715), chief baron of the Irish exchequer and a leading Jacobite. In 1802 he became Whig member for Limerick (from 1832 member for Cambridge); and after holding minor offices became secretary for war and the colonies in 1834 and in 1835-1839 chancellor of the exchequer. He was disappointed in not obtaining the speakership, but in 1839 was created Baron Monteagle of Brandon (a title intended earlier for his ancestor Sir Stephen Rice), and made controller of the exchequer. He differed from the government as regards the exchequer control over the treasury, and the abolition of the old exchequer (q.v.) was already determined upon when he died on the 7th of February 1866. His eldest son, Stephen Edmund Spring-Rice (1814-1865), deputy chairman of the board of customs, having predeceased him, he was succeeded in the title by his grandson, Thomas, and baron (b. 1849). Another son was father of S. E. Spring-Rice (1856-1902), of the treasury, and of Sir Cecil A. Spring-Rice (b. 1859), the diplomatist.

**MONTAEGLE, WILLIAM PARKER, 4th Baron, and 11th Baron Morley (1755-1829), was the eldest son of Edward Parker, 10th Baron Morley (d. 1618), and of Elizabeth, daughter and heiress of William Stanley, 3rd Baron Monteagle (d. 1581). When quite a youth he married Elizabeth, daughter of Sir Thomas Tresham, and was styled Lord Monteagle in right of his mother. He was allied with many Roman Catholic families, and during the reign of Elizabeth was in sympathy with their cause. He received knighthood when with Essex in Ireland in 1590, and in 1601 took part in the latter’s rebellion in London, when he was punished by imprisonment and a fine of £5000. He subsequently in 1602 joined in sending the mission to Spain inviting Philip III. to invade England. He was intimate with Catesby and others, and according to Father Garnet expressed an opinion some few months before gunpowder plot that the Romanists had a good opportunity of making good their claims by taking up arms against the king. It is certain that he was one of those who acquiesced in James I.’s accession and assisted Southampton in securing the Tower for the king. He was taken into favour, and received a summons to attend the parlia-

ment of the 5th of November 1603 as Lord Monteagle. On the 26th of October 1605, while sitting at supper at Hoxton, he received the celebrated letter giving warning of the gunpowder plot, probably written by Francis Tresham. After having caused it to be read aloud by Ward, a gentleman in his service and an intimate friend of Winter, one of the chief conspirators, he took it to Whitehall and showed it to Lord Salisbury and other ministers. On the 4th of November he accompanied Lord Sufolk, the lord chamberlain, in his visit to the vault under the parliament house, where Guy Fawkes was found. Monteagle received 1700 a year for his services in averting the plot. He then became a director of the Virginia Company and subscribed to its funds. The same year “dividers in his house” are reported, probably referring to his harbouring of Roman Catholic students from St Omer (Cal. of St Pap: Dom: 1603-1616, p. 533). In 1618, on the death of his father, he was summoned to parliament as Baron Morley and Monteagle. He died on the 1st of July 1622 at Great Hallingbury, Essex, where he was buried. By his marriage with Elizabeth Tresham he had, besides daughters, three sons, the eldest of whom, Henry, (d. 1659) succeeded him as 12th Baron Morley and 5th Baron Monteagle. These baronies fell into abeyance when Henry predeceased his father, in 1643.

**MONTE CASSINO**, an isolated hill overhanging the town of Cassinum, about midway between Rome and Naples. Nither St Benedict migrated from Subiaco in the early years of the 6th century, and established the monastery that became the metropolis of Western monachism. About 580-590 it was sacked by the Lombards, and the monks fled to Rome, where they were established at the Lateran basilica. The monastery was rebuilt in 720, again destroyed by the Saracens in 884, and restored seventy years later. It reached its highest point of prosperity and the influence from 1050 to 1150 under Desiderius (who became Pope Victor III. in 1087) and Oderius. The abbot became lord of an extensive territory and bishop of several dioceses: now, though not a bishop, he is ordinary of seven dioceses. At the dissolution of monasteries in 1866 Monte Cassino was spared, owing mainly to a remanenture by English well-wishers of United Italy. The monastery became a national monument and the monks were recognized as custodians. There is a large secondary school with 250 boys, and rich archives.

See L. Tosti, Storia della badia di M.C. (1841; 2nd ed., 1888); W. Herz, Morley, Kirchenlexikon (2nd ed.) and Herzog, Realencyklopädie (3rd ed.).

**MONTECATINI**, two much-frequented mineral baths of Tuscany, Italy. (1) MonteCATINI in Val di Cecina, in the province of Pisa, 5 m. W. of Volterra. Pop. (1901), 5000. The water is saline, with a temperature of 78-8° F. There are copper mines, which have been worked since the 15th century, 1338 ft. above sea-level. (2) MonteCatini in Val di Nievole, in the province of Lucca, 7 m. W. by S. of Pistoia, 105 ft. above sea-level. Pop. (1901), 3048 (Bagni di MonteCatini); 2856 (MonteCatini). The springs, which number ten, are saline, and range in temperature from 82° to 86° F. The water is both drunk and used for bathing by some 40,000 visitors annually, and is exported in bottles. There is also a natural vapour bath (86°-95° F) in the Grotta Giusti (so-called from the satyr Giuseppe Giusti, a native of the place), at Monsunnano near by, discovered in 1849. Another attraction of the place is the gardens of Collioli. At the town of MonteCatini, on the hill above (1051 ft.), the Florentines were defeated by Ugucione della Faggioni of Pisa in 1315.

**MONTE CORVINO, GIOVANNI DI (c. 1247-1328), Franciscan missionary, traveller and statesman, founder of the earliest Roman Catholic missions in India and China, and archbishop of Peking. In 1272 he was commissioned by the emperor Michael Palaeologus, to Pope Gregory X., to negotiate for the reunion of Greek and Latin churches. From 1275 to 1289 he laboured incessantly as a missionary in the nearer and Middle East. In 1280 he revisited the Papal Court, and was sent out as Roman legate to the Great Khan, the Ilkan of Persia, and other leading personages of the Mongol world, as well as to the
“emperor of Ethiopia” or Abyssinian Negus. Arriving at Tabriz, then the chief city of Mongol Persia, and indeed of all Western Asia, Monte Corvino moved down to India to the Madras region or “Country of St Thomas,” from which he wrote home, in December 1291 (or 1292), the earliest noteworthy account of the Cenomandel coast, first visited by a Christian prince, under the names of Cambolich or Peking, and wrote letters of (Jan. 8, 1305, and Feb. 13, 1306), describing the progress of the Roman mission in the Far East, in spite of Nestorian opposition; alluding to the Roman Catholic community he had founded in India, and to an appeal he had received to preach in “Ethiopia” and dealing with overland and overseas routes to “Cathay,” from the Black Sea and the Persian Gulf respectively. In 1303 he received his first colleague, the Franciscan Arnold of Cologne; in 1307 Pope Clement V. created him archbishop of Peking. At the head of sixteen sail he was to consecrate and assist him; three only of these arrived (1308). Three more suffragans were sent out in 1312, of whom one at least reached East Asia. A Franciscan tradition maintains that about 1310 Monte Corvino converted the Great Khan (i.e. Khai-Shan Kuluk, third of the Yuan dynasty; 1307-1311): this has been disputed, but he unquestionably won remarkable successes in North and East Asia. Besides three mission stations in Peking, he established one near the present Amoy harbour, opposite Formosa. At his death, about 1338, he left behind him Christian institutions of his own establishment, and an orphanage he had endowed. His tomb in Peking was visited in 1541 by the Jesuit missionary Francis Xavier, who was instrumental in the founding of the Jesuit Mission in China.

The MSS. of Monte Corvino’s Letters exist in the Laurentian Library, Florence (for the Indian Epistle) and in the National Library, Paris, 3066 Lat.—viz. the Liber de aetibus, fols. 170, v. 317, and the Liber de annis, fols. 170, v. 317. It is from these that the life of the missionary, and of his work in the Far East, is developed. The Latin of the letters is rendered into English by Father Beazley, in his Dawn of Modern Geography (1855), pp. 162-178, 206-210; also in Sir H. Yule’s Cathay (1. 197-221. See also Wadding, Annales, (1855), No. 16, 184-198, 201-203, vi. 93, 147, &c., 176, 467, &c., C. R. Beazley, Dawn of Modern Geography, ii. 162-178, 206-210; Sir H. Yule, Cathay, i. 165-173. (C. R. B.)

MONTECristo,—(anc. Oglasa), an island of Italy, belonging to the province of Leghorn, 25 m. s. of Elba. Its highest point is 2126 ft. above sea-level, and its area about 6 sq. m. It contains the ruins of a Camaldulensian monastery, founded in the 11th century and destroyed in the 16th, and is the private property of the king of Italy, who has a shooting-lodge there. The fame of the island is due to the novel, Le Conté de Monte-Cristo, by the elder Dumas.

MONTECUCULI (Monteucculi), RAIMONDO, Count of (1609-1680), prince of the holy Roman Empire and Neapolitan duke of Melfi, Austrian general, was born on the 21st of February 1609/10, at the castle of Monteucculi in Modena. His family was of Burgundian origin and had settled in north Italy in the 10th century. At the age of six, he was taken prisoner by the Monarch of Monteucculi, who, as a private soldier under his uncle, Count Ernest Monteucculi, a distinguished Austrian general (d. 1633), became a captain of infantry. He was severely wounded at the storming of New Brandenburg, and again in the same year (1631) at the first battle of Breitenfeld, where he fell into the hands of the Swedes. He was again wounded at Lützen in 1632, and on his recovery was made a major in his uncle’s regiment. Shortly afterwards he became a lieutenant-colonel of cavalry. He did good service at the first battle of Nördlingen (1634), and at the storming of Kaiserslautern in the following year won his colonelcy by a feat of arms of unusual brilliance, a charge through the breach at the head of his heavy cavalry. He fought in Pomerania, Bohemia and Saxony (surprise of Wolmirstadt, battles of Wittstock and Chemnitz), and in 1639 he was taken prisoner at Melnik and detained for two and a half years in Steitten and Weimar. In captivity he studied, not only military science, but also geometry in Euclid, history in Tacitus, and moral science. He next visited Venice, and planned his great work on war. On his release he distinguished himself again at the battle of Pavia. In 1643 he went to Italy, by the emperor’s request, and made a successful campaign in Lombardy. On his return to Germany he was promoted lieutenant-field-marshall and obtained a seat in the council of war. In 1645-46 he served in Hungary against Prince Rakoczy of Transylvania, on the Danube and Neckar against the French, and in Silesia and Bohemia against the Swedes. The victory of Triebel in Silesia won him the rank of field-marshal; at the battle of Gross Marschhausen in 1648 his stubborn rear-guard fighting rescued the imperial army from annihilation. For some years after the peace of Westphalia Monteucculi was chiefly concerned with the business of the council of war, though he went to Flanders and England as the representative of the emperor, and to Sweden as the envoy of the pope to Queen Christina, and at Modena his lance was victorious in a great tourney. In 1657, soon after his marriage with Countess Margarethe Dietrichstein, he took part in, and after a time commanded, an expedition against Rakoczy and the Swedes who had at that time been king of Poland. He became field-marshall in the imperial army, and with the Great Elector of Brandenburg completely defeated Rakoczy and his allies (peace of Oliva, 1660). From 1661 to 1669 Monteucculi with inferior numbers defended Austria against the Turks; but at St Gotthard Abbey, on the Raab, he defeated the Turks so completely that they made a truce for twenty years (Aug. 1, 1664). He was given the Golden Fleece, and became president of the council of war and director of artillery. He also devoted much time to the compilation of his various works on military history and scientific subjects, and to the progress of the French arms under Louis XIV., and when the habitable space of western Europe was invaded by Troops, where he engaged in a war of manoeuvre with the great Condé. The siege of Philipensburg was Monteucculi’s last achievement in war. The rest of his life was spent in military administration and literary work at Vienna. In 1679 the emperor made him a prince of the empire, and shortly afterwards he received the dukedom of Melfi from the king of Naples. Monteucculi died at Linz on the 16th of October 1680, as the result of an accident. With the death of his only son in 1688 the principality became extinct, but the title of count passed down through the branches of the family to the Austrian Monarch, and the Ducal title was obtained by the 13th Grand Duke of Tuscany. Monteucculi was a great diplomatist and a great general, and his name is still held in high esteem by the Austrian army. His Memorie della guerra profoundly influenced the age which followed his own; nor have modern conditions rendered the advice of Monteucculi wholly valueless.

AUTHORITIES.—The Memorie della guerra, &c., was published at Venice in 1703 and at Cologne in the following year. A Latin edition appeared in 1718 at Vienna, a French version at Paris in 1712, and the German Kriegschronik des Fürsten Raymundi Monteucculi at Leipzig in 1736. Of this work there are MSS. in various libraries, and many memoirs of military history, tactics, fortification, &c., written by Monteucculi, but the most important are undated. The collected works of Monteucculi were published at Milan (1807), Turin (1821) and Venice (1840), and include political essays and poems.

See Campro, Raimondo Monteucculi (Florence, 1876); Spenholz, Aureum vellus seu catena, &c. (Vienna, 1668); memoir prefixed to the Memorie (Cologne edition); this appears also in v. der Groen’s Nederlandsche Geschiedenisboeken. There are also works by the Archiv für Zeitgeschichte Held (St. Pölten, 1878); Schwager, Oesterreichs Heiden (Vienna, 1853); Paradisi, Elogio storico del conte Raimondo Monte- cucli, &c. (Vienna, 1806); Oesterreichisches militairische Zeitschrift (Vienna, 1818, 1828 and 1842); Pozzol, Lebensbeschreibung Monteucculis (Vienna, 1792); Hornmayr, Oesterreichischer Plutarch (Vienna, 1818); Reilly, Biographie der berühmtesten Feldherren Deutschlands (Vienna, 1833); Nußbaumer, Geschichte der Kaisertums, &c., pt. 19 (Vienna, 1808); Teufelbach, Vaterländisches Ehrenbuch (Vienna and Teschen, 1877); Die Hofkriegergesetze, präsentiren (Vienna, 1874); Weingärtner, Halbenbuch (Vienna, 1882); Grossmann, Archiv für Ost. Geschichte (Vienna, 1878); also
supplement to Militär. Wochenblatt (Berlin, 1878); Organ des militär- wissenschaftl. Vereins (Venice, 1881); Reale istituto veneto di scienze, vili. 5, 6 (Venice, 1881); Rivista militare Italiana (March and April 1882); Allgemeine deutsche Biographie, vol. 3 (Leipzig, 1888).

Important controversial works are those of Turpin and Warnery, two distinguished soldiers of the 18th century (Commentaires sur les mémoires, éc. (Paris, 1796), and Commentaires sur les campagnes de 1812, 1813, 1814, 1815. A critical estimate of Montecuccoli's works will be found in Jahn's Gesch. der kriegswissenschaften, ii. 116-117 (Leipzig, 1890).

MONTEFALCO, a town of the province of Perugia, Italy, 6 m. S.W. of Foligno, situated on a hill, 1550 ft. above sea-level. Pop. (1901), 3307 (town); 5726 (commune). The church is the burial-place of Count Francesco Cesi (b. 1587, d. 1649), who was murdered while on a visit to France. The other church of note is the Chiesa di San Giovanni Battista, in which is interred the body of Count Giuseppe Cesi (b. 1594, d. 1648), who died at the siege of Legorno. 

MONTEFALCO—MONTEIL 765

German and Austrian frontiers, caused Montefiore to proceed to St Petersburg, where in an interview with the tsar he succeeded in getting the ukase rescinded. On his return, Queen Victoria, on the recommendation of Sir Robert Peel, made him a baronet. In 1859 a case of injustice which attracted the attention of all Europe brought Sir Moses to the gates of the Vatican. A Jewish child named Mortara had been secretly baptized by its nurse and stolen from its mother, who died of grief. Cardinal Antonelli, in the name of the pope, refused to give up the boy, who became a priest. In 1863 we find Montefiore on a mission to Constantinople to obtain from the Sultan, Abdul Aziz, the confirmation of his predecessor's decrees in favour of the Jews; in 1864 in Morocco to combat an outbreak of anti-Semitism; in 1866 in Syria, relieving the distress resulting from a plague of locusts and an epidemic of cholera; and in 1867 in Rumania, once more pleading the cause of the oppressed Jews with Prince Charles. In 1872 Montefiore was deputed by the British Jews to present to Alexander II. their congratulations on the bicentenary of the birth of Peter the Great, and was received by the tsar with great honour at the Winter Palace. His seventh and last pilgrimage to the Holy Land was made in 1875, of which he wrote an account in his Narrative of a Forty Days' Sojourn in the Holy Land, published in that year. The last decade of his life was passed in comparative quiet upon his estate near Ramsgate, in Kent; and there, after having received general congratulations on the completion of his hundredth year, he passed peacefully away on the 28th of July 1885. Sir Moses Montefiore was a strictly orthodox Jew, scrupulously observant of both the spirit and the letter of the Scriptures; in his grounds he had a synagogue built where services are still held twice a day, a college where ten rabbis live and expound the Jewish law, and a mausoleum that contains the remains of himself and of Lady Montefiore, who died in 1862.

MONTEFIORE, a town of southern Spain, in the province of Granada, on the river Bilano. Pop. (1900), 10,725. Montefiore is largely Moorish in character, and dominated by a Moorish castle. Being built midway between the Sierra de Priego and Sierra Parapanda, and commanding the open valley between these ranges, it became one of the chief frontier fortresses of the Moors in the 13th century. Its industries include manufactures of cotton stuffs, alcohol and soap.

MONTEGUT, JEAN BAPTISTE JOSEPH ÉMILE (1825-1895), French critic, was born at Limoges on the 14th of June 1825. He began to write for the Revue des deux mondes in 1847, contributing between 1851 and 1857 a series of articles on the English and American novel, and in 1857 he became chief literary critic of the review. Émile Montegut translated Essais de philosophie américaine (1839) from Emerson; Révolution de 1688 (2 vols. 1853) from Macaulay's History; and also produced Les Oeuvres complètes (10 vols. 1866-1875) of Shakespeare. Among his numerous critical works are Écrits modernes d'Angleterre (3rd series, 1885-1892) and Heures de lecture d'un critique (1881), studies of John Aubrey, Pope, Willkie Collins and Sir John Manville. Montégut died in Paris on the 11th of December 1895.

MONTEIL, AMANS ALEXIS (1769-1850), French historian, was born at Rodez in 1769, and died at Cély (Seine-et-Marne) in 1850. His tastes were historical, and he taught history at Rodez, at Fontainebleau and at St Cyr. He held that a disproportionate importance had been given to kings, their ministers and generals, and that it was necessary rather to study the people. In his Histoire des français des divers états, ou histoire de France aux cinq derniers siècles (10 vols., 1828-1844) he undertook to describe the different classes and occupations of the community. For this he made a collection of manuscripts, which he sold in 1835 (many of them passed into the library of Sir Thomas Philips), drawing up a catalogue under the singular title of Traité de matériaux manuscrits de divers genres d'histoire. He boasted of having at first to write really "national" history, and he wished further to show this in a memoir entitled L'Influence de l'histoire des divers états, ou comment l'état allemand de la France si elle eût eu cette histoire (1849; reprinted in 1841 under
See V. Capralbi in Mem. Inst. (Rome, 1832), pp. 159 sqq. ; F. Lenormant, La Grande-Grece (Paris, 1882), iii. 155 sqq. (T. As.)

**MONTÉLIMAR**, a town of southern France, capital of an arrondissement in the department of Drôme, near the left bank of the Rhone, 93 m. S. of Lyons on the railway to Marseilles. Pop. (1866), town, 9165; commune, 13,554. The ancient castle is now used as a prison. Remains of the ramparts and four old gates are also preserved. The chief public institutions are the sub-prefecture, the tribunal of first instance and the communal college. The industries include flour-milling, silk-throwing and spinning, and the manufacture of hats, lime, farm implements, printed goods, and so on.

Montélimar was called by the Romans Acusium. At a later period it belonged to the family of Adhémar and received the name Monteil d'Adhémar, whence the present name. Towards the middle of the 14th century it was sold by them partly to the dauphins of Viennois and partly to the pope, and in the next century it came into the possession of the Crown. During the religious wars it valiantly resisted Gaspard de Coligny in 1570, but was taken by the Huguenots in 1587.

**MONTENEGRO** (or Montémor), JORGE (1520?—1561), Spanish novelist and poet, of Portuguese descent, was born about 1520 at Montemayor y Yello (near Coimbra), whence he derived his name, the Spanish form of which is Montemayor. He seems to have studied music in his youth, and to have gone to Spain in 1543 as chorister in the suite of the Portuguese Infanta Maria, first wife of Philip II. In 1552 he went back to Portugal in the suite of the Infanta Juana, wife of D. João, and on his death in 1554 returned to Spain. He is said to have served in the army, to have accompanied Philip II. to England in 1555, and to have travelled in Italy and the Low Countries; but it is certain that his poems were published at Antwerp in 1553 and again in 1558. His main literary work, the *Diana*, a pastoral romance published about 1559. Shortly afterwards Montemayor was killed in Piedmont, apparently in a love affair; a late edition of the *Diana* gives the exact date of his death as the 26th of February 1561. The *Diana* is generally stated to have been printed at Valencia in 1542; but, as the Canto de Orfeo refers to the widowhood of the Infanta Juana in 1554, the book must be of later date. It is important as the first pastoral novel published in Spain; as the starting-point of a universal fashion; and as an indirect source through the translation into English of the *Epistles*, *epitaphs* and sonnets (1563), of an episode in the *Two Gentlemen of Verona*. Though Portuguese was Montemayor's native language, he only used it for two songs and a short prose passage in the sixth book of the *Diana*. His mastery of Spanish is amazing, and even Cervantes, who judges the verses in the *Diana* with unaccustomed severity, recognizes the remarkable merit of Montemayor's prose style. That he pleased his own generation is proved by the seventeen editions and two continuations of the *Diana* published in the 16th century, by parodies, imitations and renderings in French and English.

**MONTENEGRO**, a country of south-eastern Europe, forming an independent kingdom situated upon the western side of the Balkan Peninsula, and possessing a small coast-line on the Adriatic Sea. The name is the Venetian variant of the Italian Monte Nero, and together with the Albanian Mal Esiya, the Turkish Kara-dagh, and the Greek Marathon, reproduces the native, or Serb, Tarnagora, "the Black Mountain"; it is derived from the dark appearance of Mount Lovchen, the culminating summit of Montenegro proper, of which the northern and eastern descivities, those which are viewed from the country itself, are in shadow for the greater part of the day.1 The dusky pine forests, which once clothed the mountain and of which remnants exist on its northern slope, contributed to its sombre aspect. Up to the end of the 15th century, when its territory became restricted to the mountainous districts immediately north and east of Mount Lovchen, the kingdom was known as the Zenta or Zeta, but the name Tarnagora was probably used locally in this region from the time of the earliest Slavonic settlements.

Monenegro extends between 42° 30' and 47° 21' N., and between 18° 30' and 20° E.; its greatest length from north to south is about 100 m.; its greatest breadth from east to west about 80 m. It is bounded by the Adriatic on the S., the seaboard extending for 28 m.; by the Primore, a strip of the Dalmatian litoral, on the S.W. and W.; by the Austrian (formerly Turkish) provinces

---

1 Cf. the similarly-named *Tarna Planina* in eastern Montenegro, Tcherni Vrh, the culminating summit of Mount Vitosh in Bulgaria; and *Maro Vouno* in the island of Salamis. Various other explanations and names Montenegro, mostly of Turkish character, have been put forward: see Kurt Hassert, "Der Name Montenegro" in *Globus*, No. 67, pp. 111-113 (Leipzig, 1895).
of Bosnia and Herzegovina on the N.W. and N.; by the
Ottoman empire both in the sanjak of Novibazar, on
the N. and N.E., and also in the vilayets of Kosovo and
Scutari on the N.E., E. and S.E. Its area, as officially
estimated after the treaty of Berlin had been enforced in
1880, amounts to 3235 sq. m., or considerably less than half
the size of Wales. The present frontier, which was not finally
decided until 1866, is drawn so as to follow the curve of the
main rivers. It extends as far as Lake Sass (Shas), then follows
the river Mequr to the summit of Mount Bratovitza, reaching Lake Scutari at a spot
opposite the island of Goritza Topal. Crossing the lake north-
east to a point a little south-east of Flavnitza, and leaving the
territory of the Hott and Klementi tribes to the south, and
the districts of Kutchka Kraina to the north, it passes north of
the districts of Plava and Gusynye and reaches the western end
of the Mokra Planina, where it turns to the north-west. After
crossing the Lim at its junction with the Skula, it coincides with
the old frontier for some distance; then reaching the Tara at Maikovatz, it follows the course of that river to its junction with
the Piva: turning southwards, it reaches the old frontier once
more at Klobuk, and, passing between the district of Grabovo
and the Krivoshian Mountains, approaches to within a few miles
of the Bocche di Cattaro; then, following the maritime mountain
ridges for a considerable distance, it rejoins the coast a little
south of Spizza.

Physical Features.—Montenegro, which forms the meeting-point
of the Dalmatian, Bosnian and Albanian ranges, seems at first a
mere chaos of mountains. It is, however, naturally divided into
deeply indented districts, each with its own character. (1) Fertile and well-watered plains, not unlike those of Lombardy, border the river
Zeta, and after its junction with the Moratcha extend along the
eastern bank of that river to Lake Scutari. A fringe of similarly
watered plains forms the maritime plain extending between the
Sutorman range and the mouth of the Boyana. (2) Westward, under the shadow of
Lovchen, is the Katunska, or "Shepherds' Hills," the cradle of
Montenegrin National Liberty. This region presents a surface of hard calcareous
rock, bare and calcined, with strata sinking to the south-west
at an angle often of 70°. The rocks have been split by atmospheric
agents into huge prismatic blocks, and the crevices have been
gradually worn away into fissures several fathoms deep. In some places
the interior of the stony mass is hollowed out into galleries and
caves, some of great length; during the rainy season subterranean
lakes form and extend into the foot of the crags, while the
water collected in these lakes has its way out through canals and
caves, and, sometimes, by rushing down the slopes, forms majestic
gorges. Among these gorges the Zabljak is certainly the most
long and celebrated, and here the mountains are on the whole
most elevated and rugged. (3) The Vrkh Gusinye, between the
Boyana and the Zabljak, is a mountainous region divided into
a number of separate ranges, the highest of which is that
of Mount Bashkia, 5691 ft., which is considered the
highest mountain of the country, and is distinguished by
the beautiful and splendid temple of the Holy Virgin, a
structure of great antiquity. (4) The eastern end of the
N. of the Montenegrin range is marked by the
mountain range of the Scutari and the Montenegrin
Gorges, which are divided by the Boyana and the
Zabljak. The Scutari is distinguished by the
mountain range of the Dukle, 5091 ft., and
the Dukle, 5091 ft., and
the

This mountain must be distinguished from the higher Maglich
(7699 ft.), on the northern frontier, near the junction of the rivers
Tara and Piva.

overhanging Antivari. The prevailing formations of the north and
cast are Palaeozoic sandstones and schists, with underlying trap
rocks. The southern districts are divided by the Zeta-Moratcha river
system, which forms the boundary between the Montenegrin
and the Serbian provinces, and which sends off a number of
tributaries to Lake Scutari and the Boyana, while the streams from the
northern districts form the headwaters of the Drina, which reaches
the Danube by way of the Savo. The Zeta, rising in Lake Scutari,
near Nikshich, is remarkable for its subterranean passage beneath
a mountain range 1000 ft. high. At Ponor, not far from that
town, the water vanishes in a deep chasm, reappearing at a
distance of several miles on the other side of the mountains.
Its whole course to its junction with the Moratcha is about
30 m. Rising in the Yavorje Planina, the Moratcha sweeps
through mountain gorges till it reaches the plain of Podgoritzi;
then for a space it almost disappears among the pebbles and other
alluvial deposits, nor docs it again show a current of any considerable
volume till it approaches Lake Scutari. In the neighbourhood of
Dukle 2 and Leskopolje it flows through a precipitous ravine from
50 to 100 ft. high. In the dry season it is navigable from the lake
of Zabljak. The whole course is about 60 m. Of the left-hand
tributaries of the Moratcha the Sem or Tzom deserves to be men-
tioned for the magnificent cataract through which it flows between
Most Tamarini and Dinosa. On the one side rise the mountains
of the Kutchi territory on the other the immense bluffs of the Prokletia
range—the walls of the gorge varying from 2000 to 4000 ft. of
vertical height. Lower down the stream the rocky banks approach
so close that it is possible to leap across without trouble. The
Sem rises in northern Albania, and has a length of 70 m. The Rieka
issues full-formed from an immense cave south-east of Cettigne
and falls into Lake Scutari. The three tributaries of the Drina which
begin in part to Montenegro are the Piva, the Tara, and the Lim,
respectively 55, 95 and 120 m. in length. The Tara form the
northern boundary of the kingdom for more than 50 m., but the
Lim flows beyond the border after the first 30 m. of its course. The
western half of Lake Scutari, or Skodra, belongs to Montenegro;

2 Dukle is the name still borne by the ruins of the Roman Doclea,
often, but wrongly, written Dioclea, from its association with
the Emperor Diocletian.
The eastern, with Scutari itself, to Albania. It is a magnificent sheet of water, measuring about 135 sq. m., with an average depth of two to three fathoms. The northern end is studded with picturesque islands. The level of Lake Scutari undergoes a slight limitation according to the height of the water. The lake is situated on an Albanian river, which before 1830 entered the Adriatic near San Giovanni di Medua, changed its course so as to join the Boyana just below its exit from the lake. The level of the lake was reduced by budding the lower valleys of the tributary streams and permanently enlarging its area. A few small lakes are scattered among the mountains, and it is evident that their number was formerly much greater. Montenegro proper (i.e. the Scutari principality) is a mountainous country and drained almost absolutely waterless, the only stream being the Rieka, which probably drains the Cettigne basin by an underground outlet. Its lower course is practically an inlet from the sea, and it emerges up the town Rieka. The upland plain of Cettigne, now waterless, was doubtless the bed of a lake at no very distant (geological) period; it is still sometimes flooded after heavy rains. The scarcity of water, and the very contrasted taste of mineral water, place the country against Turkish invasion: the few springs are hidden in deep crannies among the rocks, and the inhabitants are accustomed to preserve melted snow for use during the summer. On the other hand, Brela1 and north-eastern districts are abundantly watered. The maritime district possesses two small streams.

Climate.—The climate generally resembles that of northern Albania and Dalmatia, but is considerably more mild. In comparison with the valleys, while in the maritime districts of Antivari and Duligovo it may be compared with that of central Italy. The mean annual temperature is about 58° F. Snow lies for most of the year on many heights, and the snow lies more perfectly on the darker slopes of the high basin of Cettigne (2093 ft.) is deeply covered with snow during the winter months, and the capitation is sometimes almost inaccessible; in summer the days are hot, but the nights cool and chily. The climate is generally healthy except in a few marshy districts.

Flora and Fauna.—The Alpine vegetation of the summits gives way to pine forests in the sub-Alpine zone (about 6000 ft.); below these the beech, and then the oak, the walnut, the wild pear, and wild plum make their appearance; the fig-tree, the mulberry, and the vine grow in the middle Zeta and Moratcha valleys, the myrtle, orange, peach, and olive in the lower Moratcha region, and almost abundantly in the Zrmnaitza and maritime districts. In the forest districts the beech is the prevailing tree up to a height of about 5500 ft., the fir forming little woods in the closes to the sea and Lake Scutari but never ascends more than 1000 ft. Pomegranate bushes grow wild, and in many parts of the south cover the foot of the hills with dense thickets, the crimson blossoms of which are one of the special charms of the spring landscapes. The leaves of the sumach (Rhus cotinus), which flourishes in the warmer districts, are exported for use in dye-works; the Pyrethrum cinerariaefolium supplies material for the manufacture of insecticide, and the wild plum is used by the peasants to make grape, is employed for the production of raki or rakija, a mild spirit, which is a favourite beverage with the people. Bears are still occasionally met with in the mountains, but the wolf and the red and black foxes are more common. There is a vast variety of reptiles in the country, including the poisonous Ilyrian viper (Vipera ammodytes). Esculent frogs, tree frogs, the common tortoise, and various arguable forms of communication. The communications between the mountains and the coast is by road, and there is a good communication between Antivari and Duligovo. The postal and telegraphic communication is by a line of post-railways. The line of road is from Podgorica to Duligovo, and from there to the coast. The road is maintained by the state and is open all the year round.

Agriculture and Stock-farming.—Except in the lowlands, which serve as the granary of Montenegro, furnishing wheat, maize, barley, rye, potatoes and capucins, there is little tillage. Methods and implements for agriculture are inferior to those of Austria. In the lakes Scutari and Duligovo the fisherfolk are glad to enclose the smallest spaces of the fertile red soil which is

1 The name Brela (literally "mountains") signifies in ordinary speech the mountain-group cast of the Zeta which was incorporated in the principality in 1796. It figures in the prince's title, but is not otherwise used in official documents.
Zeta was founded in 1871 by Prince Nicholas and named after his predecessor, Danilo II. In the vicinity is Oriakul, the prince's palace, with its mulberry nurseries. Spuzh (1800), a little lower on the east bank of the Zeta, possesses a fortified acropolis. Niegush or Nyegosh (1853), on the road from Cettigne to Cattaro, is the ancestral abode of the ruling family, which originally came from Niegush in Herzegovina. Zhablik (1200), near Lake Scutari, was the capital until late in the 15th century. It was a Venetian stronghold. Rieka (1768), near the northern end of Lake Scutari, derives some commercial importance from its position. Grahoovo (1800), in the extreme west, is famous for the Turkish defeats of 1851 and 1876. Other small towns are Kolashin, Virbaraz and Andriyevitza.

The Montenegrins present all the characteristics of a primitive race as yet but little affected by modern civilization. Society National Character is still in that early stage at which personal valour is regarded as the highest virtue, and warlike prowess constitutes the principal, if not the only, claim to pre-eminence. The chiefs are distinguished by the splendour of their arms and the richness of their costume; women occupy a subject position; the physically infirm often adopt the profession of minstrels and sing the exploits of their countrymen like the bards of the Homeric age. A race of warriors, the Montenegrins are brave, proud, chivalrous and patriotic; on the other hand, they are vain, lazy, cruel and revengeful. They possess the domestic virtues of sobriety, chastity and frugality, and are warm-hearted and hospitable. The women are graceful and becoming and bewitch the temptuous of strangers. They are endowed in no small degree with the high-flown poetical temperament of the Serb race, and delight in interminable recitations of their martial deeds, which are sung to the strains of the gaja, a rudimentary one-stringed fiddle. Dancing is a favourite pastime. Two characteristic forms are the slow and stately ring-dance (kolo), in which women sometimes participate, though it is usually performed by a circle of men; and the livelier measure for both sexes (oro), in which the couples face one another, leaping high into the air, while each man supports his partner on his hand. The oro is the traditional dance in the Katunska district. Women chant wild dirges, generally improvised, over the dead; mourners try to excel one another in demonstrations of grief; and funerals are celebrated by an orgy very like an Irish "wake." Like most imaginative peoples, the Montenegrins are extremely superstitious, and belief in the vampire, demons and fairies is almost universal. Among the mountains they can converse fluently at astonishing distances. The physical type contrasts with that of the northern Serbs; the features are more pronounced, the hair is darker, and the stature is greater. There are tall, often exceeding 6 ft. in height, muscular, and wonderfully active, displaying a cat-like elasticity of movement when scaling their native rocks; their bearing is soldier-like and manly, though somewhat theatrical. The women, though frequently beautiful in youth, age rapidly, and are short and stunted, though strong, owing to the drudgery imposed on them from childhood; they work in the fields, carry heavy burdens, and are generally treated as inferior beings. Like the Albanians, the Montenegrins take great pride in personal adornment. The men wear a red waistcoat, embroidered for a good control. They belong, by turns, sometimes thrown into cold weather; a red girdle, in the folds of which pistols and yataghans are placed; loose dark-blue breeches and white stockings, which are generally covered with gaiters. The opanka, a raw-hide sandal, is worn instead of boots; patent leather long boots are sometimes worn by military officers and a few of the wealthier class. The head-dress is a small cap (kapo), black at the sides, in mourning for Kossovo; red at the top, it is said, in token of the blood shed then and afterwards. On the top near the side, five semicircular bars of gold braid, enclosing the king's initials, are supposed to represent the five centuries of Montenegrin liberty. There is little authority, however, for this and other fanciful interpretations of the pattern, which was adopted in the reign of Prince I; the red fez, from which the kapa probably derives its colour, was previously worn. A blue or green mantle is sometimes worn in addition by the chiefs. The poorer mountaineers are often dressed in coarse sacking, but all without exception carry arms. The women, as befits their servile condition, are generally clothed in black, and wear a black head-dress ornamented with Swords and holidays, however, a white embroidered bodice, silver girdle, and bright silk skirt are worn beneath an open coat. Over this is placed a short, sleeveless jacket of red, blue, or violet velvet, according to the wearer's age. Unmarried girls are allowed to wear the red kapa, but without the embroidered badge. The Vasojevitch tribe retain the Albanian costume, in which white predominates. Turkish dress is often seen at Anti.vari, Dulcigno and Podgoritz. The dwelling-houses are invariably of stone, except in the eastern districts, where wooden buts are found. As a rule, only the mansions of cattle-owners have a second story: the ground floor, which is dark and unventilated, is occupied by the animals; the upper chambers, in which the family reside, are reached by a ladder or stone staircase. Chimneys are rare, and the smoke of the fireplace escapes through the windows (if any exist) or the open doorway. The principal food of the people is rye or maize cake, cheese, potatoes and salted xerana; their drink is water or sour milk; meat is seldom tasted, except on festive occasions, when rakli and red wine are ad lib. The woman's dress, a long skirt and a white head-band, is influenced by the smoking of cigarettes; in the districts which formerly belonged to Turkey the men, whose dignity never permits them to carry burdens, may be seen going to market with the chibik, or long pipe, slung across their backs. The mother possesses little influence over her sons, who are trained from their earliest infancy to cultivate warlike pursuits and to despise the weaker sex. Betrothals often take place in early childhood. Young men who are attached to each other are accustomed to swear eternal brotherhood (jbrodatimstvo); the bond, which receives the sanction of the Church, is never dissolved. Marriages between Montenegrins and converted Turkish girls are a common source of blood-feuds. The zadruja, or house-community, under the rule of a starenina, or house-father, is found in Montenegro as in other Slavonic lands (see SERVIA). The tribal system still exists, but possesses less significance than in Albania, owing to the centralization of authority at Cettigne. The tribe (pleme, pl. plemena) is subdivided into clans (bralstu).

Constitution and Government.—Notwithstanding the creation of an elective senate in 1857, the grant of a so-called constitution in 1866, and the establishment of a responsible ministry in 1878, the government remained autocratic till 1905, the whole power, even the control of religion and finance, which the constitution of 1868 had conceded to the senate, being centred in the hands of the prince, who in 1910 assumed the title of king. The senate, instituted by Peter II., with the object of limiting the power of the tribal chieftains, was in 1881 merged in a council of state, the members of which, six in number, were nominated and dismissed by the prince. The council supervises measures to be laid before the Skupština, or national assembly, and exercises a controlling influence over the government. TheSkupština is divided into three departments: (1) the interior, with separate sections for public works, posts and telegraphs, commerce and industry, shipping, sanitary service and agriculture; (2) foreign affairs; (3) war; (4) finance; (5) justice; and (6) education. On the 19th of December 1905 a new constitution was proclaimed by Prince Nicholas. A Skupština was instituted, consisting of 65 elected deputies, 9 ex officio members (the higher ecclesiastical and civil dignitaries), and 3 generals nominated by the prince. The Skupština is elected by manhood suffrage for a period of four years, and is summoned annually on the 31st of October. In conjunction with the Crown it exercises the legislative power; the ministers are responsible to it as well as to the Crown. The constitution affords financial supervision to the Skupština, which elects a board of control and votes an annual budget; it guarantees liberty of the person, of religious belief, and of the

XVIII. 25
The country is divided into 5 departments (oblasti), each governed by a prefect (upravitel), and 36 districts (kapetanstvi), each under an official styled kapetan. The prefects and kapetans are nominated by the king on recommendation of the minister of the interior. Rural communes, each under an elected kmet, or mayor, exist in 565 villages; a small Slavonic language and the ancient communal rights are generally preserved.

The circulation of the plemena; permanent popularly divided in 1899. The first permanent judicial reforms were carried out by Count Volnovitch, a native of Rouska, in 1888, and revised and enlarged in 1890. It contains elements from various foreign systems, scientifically adapted to national usages and requirements. A large number of judicial reforms were carried out by Count Volnovitch, who succeeded Professor Bogishitch in 1899; in 1905 a new code of civil procedure was promulgated, and a criminal code in the following year. The only prison is at Podgoriza. In the old prison at Cettigne, closed after 1902, many of the inmates were free to walk in and out at pleasure. Some were burdened with fetters, rather as a punishment than for restraint. Until the completion of an asylum in 1903, dangerous lunatics were confined in prison. The commonest offences are murder and robbery; despite vigorous measures taken by the king and his predecessors, the blood-feud, or vendetta, cannot be stamped out, being approved, and even enforced, by public sentiment. Only women are held exempt from the duty of avenging their next-of-kin; they have been known, however, to undertake it, disguising themselves in male attire. A man who kills his slanderer, or otherwise avenges his honour, often receives a nominal term of imprisonment. Robbery, if practised by means of raids across the frontier, is remarkably regarded as a venal offence. Other forms of crime are rare, and foreigners may traverse all parts of the kingdom, except the neighbourhood of the Albanian border, in perfect safety. The death penalty was first introduced by Peter I. Executions are carried out by a firing party selected from the various tribes, in order to prevent the relatives of the criminal from exacting vengeance. Exceptional severity is shown in the treatment of political offenders, who in some instances have been subjected to solitary confinement for years without trial.

Finance.—Financial statistics are not published. The total receipts were estimated in 1907 at 2,775,693 Austrian kronen. The principal sources of revenue being the stamp duties on land, houses, and cattle, the monopolies of tobacco, salt, petroleum and alcohol, and the customs dues. The total expenditure was estimated at 2,730,994 kronen. The principal items being: civil list, 8¢, 185,696 kronen; ministry of interior, 574,822 kronen; of foreign affairs, 144,547 kronen; of justice, 232,710 kronen; of finance, 592,561 kronen; of war, 133,666 kronen; of worship and education, 269,208 kronen; of national debts, 24,313 kronen. The contribution of Montenegro to the Ottoman debt has not been fixed. From time to time considerable subventions have been received from Russia and Austria. The annual Russian subsidy, mainly for military and educational purposes, is stated to be about 1,600,000 rubles; in all Slavonic countries gold and silver coins are generally employed together with Montenegrin nickel and bronze coins struck in Austria. Turkish gold and silver are also in circulation. The former Turkish and Venetian weights and measures have been so little altered as to be sufficiently convenient.

Defence.—The Montenegrins are a born warrior; his weapons, which he never lays aside, are his most precious possession, and distinction in battle is the sole object of his ambition. Persons of all classes of society are liable to the drafts for military service, the qualifications being that a man will take from me my brother as my rifle," says a native prover; and rifles are almost universally carried by the Albanian frontier, and are the more so in the districts lying on the borders of Serbia. Brave to a fault, an unerring marksman, hard, agile, crafty and enduring, the Montenegrin has few rivals in the practice of guerrilla warfare. The traditional method of fighting is by ambuscade; the Montenegrin is enterprising, bold, and resourceful, and can be harried by rifle-fire; then the mountaineers, throwing aside their firearms, deliver a swift attack with the kunjar, or yataghan, which they wield with terrific effect. A number of heads cut off in battle adorned the parapet of a small tower outside Cettigne, called the "Turks' Tower," as late as 1850. When reduced to extremity the Montenegrins often committed suicide rather than fall into the hands of the enemy. For 2,775,693 Austrian kronen, an army of 5,000 men was organized in 1897. The name is still borne by a small corps (20 men in 1907) which guards the residences of the king and his sons, but the feathers are no longer worn. In 1853 Danilo II. ordered the enrolment of all men capable of bearing arms, and instituted a military hierarchy of vojniks (generals), sirdars (colonels) and kapetans; the organization, which was based on the tribal system, was remodelled by his successors, and the officers in 1895 were ordered to receive military instruction. In the same year arms of precision were introduced: the cost and complex structure of the new weapons threatened to cause serious difficulty, but Russian aid was soon forthcoming. Since 1870, though arms and ammunition are manufac-

4 The krone = 10d. English.
also kept in each household. The artillery was composed in 1910 of 18 siege, 25 field and 38 mountain guns, with 4 howitzers, 15 mortars and 15 field guns. The bulk of almost all the 2,000 men is a principal arsenal at Spuz, where the heavier guns are kept, the others are distributed among 8 of the 11 local brigades. The garnisons numbered by the Peace of Diri, for whose disbanding was proposed by Prince Nicholas himself. He himself proposed to form a bodyguard of 3000 picked men under Prince Mirko, King Nicholas’s second son, but the project was abandoned in view of the jealousies to which it would have given rise. The Cettigne, or Cetinje, remains unfortified, there is no cavalry. In 1894 the sultan presented Prince Nicholas with equipment for a small mounted body-guard (32 men), and offered the services of three instructors. This corps, however, ceased to exist when Prince Nicholas retired. Roman religion is now given spot within 48 hours. The signal for mobilization is mainly given telegraphically; bonfires, trumpet-calls and volley-firing are all avoided. Signal-calls are made, and the army is ordered to present itself at the given spot within 48 hours. An ambulance corps has been formed. Transport is efficient, all draught animals, however, in the country have been registered and a few carts have been provided. The wives and daughters of the men who provide the commissariat, and carry the ammunition.

Religion.—The Cetinje Church is an autocephalous branch of the Eastern Orthodox communion. In 1894 it formally vindicated its independence against the claims of the Russian synod. The vladikas, or prince-bishops, formerly depended on the patriarchate of Ipek. The theocratic system of government which existed from 1389 to 1565 was re-established in 1895 by Bishop Dimitrije. In judgments relative to divorce his verdicts may be reversed by the king. Otherwise he is supreme in matters spiritual. There are 159 parishes of the Orthodox Church, 10 Roman Catholic parishes (under the jurisdiction of Avinči and 10 Montenegrin parishes under a muta. The churches are small, unpretending structures, almost all exactly alike; a handsome cathedral, however, has been erected at Nikšić. The principal monasteries, in addition to the convent at Cettigne, are those of St Nicholas, on the Moratcha, and of St Basil at Ostrog. The monastic order is almost extinct; the parochial clergy, who numbered about 400 in 1900, and 80 in 1910, is disestablished, and the services are performed in the national costume, carry weapons, take part in warfare, and follow the ordinary avocations of the peasantry. Even the old vladikas discarded the episcopal robe, except when engaged in their duties. The clergy are still for the most part extremely ignorant.

Education.—The Bogoslovia, a seminary for the instruction of the young priests and schoolmasters, was established at Cettigne in 1869. It is maintained by a subvention from the emperor of Russia, while the imperial supports the Zemski Tzrnogoriisk Institut, an excellently managed school for girls (86 pupils in 1907). Cettigne, the old university town, formerly the seat of a diocese, may be seen on Sundays, not only distributing general information, but teaching the shepherds how to safeguard their flocks from disease, and the lowland cultivators how to tend their trees. These educational and cultural institutions are supplemented by the work of the primary schools, in the rural districts it is free; in the towns a small fee is charged. In 1906 there were 11,776 pupils in the primary schools, of whom 11,063 were boys and 7975 pupils; and two secondary schools (at Cettigne and Podgorica) with 21 professors and about 1000 pupils; the Moslems and Roman Catholics have separate schools. There are also gymnasia, or high schools, at Cettigne and Podgorica, with about 700 pupils. Students desirous of higher education proceed abroad, for the most part to the university in Belgrade. The progress of education under Prince Nicholas was very remarkable. In the time of Peter II., who reigned two of his chieftains in the palace, there were only three schools in the principality. In 1876, at the beginning of the war, there were 52 schools, with 62 teachers and 2395 pupils. The schools were closed during the war, and at its conclusion only 22 could be reopened, owing to want of funds. Elementary education was reorganized in 1878.

Language and Literature.—The Montenegrin language is practically identical with that of the Serbs. The old Latin alphabet was complicated by the use of the printing-press at Obod. This was established in 1493, a few years after Caxton set up his first press in Westminster. It was destroyed by the Turks in 1565. The first book printed in Montenegro was a facsimile of the "Wreath," a drama describing the massacre of the Montenegrin Molesm by their Christian kinsmen in 1702. The reigning family has produced a succession of poets; the songs of Mirko Petrovich, the father of Prince Nicholas, and the lyrics and dramas of Prince Nicholas himself enjoy great celebrity. The Orilole, or Turtle, is an old dance of Montenegro, which was revived in 1849 by the Drs of Danilo II. by the Orilole, or Eagle. The first Montenegrin newspaper was published at Cettigne, founded in 1870, was prohibited on the Austrian frontier, and soon disappeared; it was replaced by the Glas Tzrnogorit, or "Voice of the natural region, publication. There were in 1910 three other journals in the kingdom.

Antiquities.—In Montenegro, as in Albania, the monuments of early civilization bear witness to Roman rather than to Greek antiquity. The Roman shield is shown on the zovets, or coins, of the Zeta, and early Latin churchs exist at Dulcino (Oleumum) and other places. "The organization and forms of the zovets were different from province to province; in the West and not to the East." It is evident that Latin civilization was firmly planted in Ilyria before the barbarian incursions of the 6th century. Latin sepulchral inscriptions and some finely cut marble sarcophagi have been found within the country. Especially interesting and important are the extensive ruins of Dobele, now known as Dukle, the birthplace of the Emperor Dociot. The city, which received the franchise under the Flavian emperors, occupied a remarkable site at the junction of the rivers Zeta and Moratcha. The outer walls are standing in many places, and excavations are in progress. A fine civil basilica, with a great inscription on the architrave, was discovered in the Zeta, and several inscriptions, columns, richly worked capitals and tracery, and mosaic pavements have been brought to light. At Medan there are remnants of polygonal masonry. Ilyrian forts are found in many parts of the country, indicating the existence of a colchian civilization. Almost every trace of medieval culture. The fortress of Obod, the site of the famous printing-press, is a heap of ruins; pieces of it are scattered in the monastery Antoin. The city of Zeta, founded in 1159, was destroyed in 1224, and rebuilt in 1372. The building, the home of the reigning vladikas, has been previously sacked by the Turks in 1623, and was again destroyed by them in 1697. The fortress-monastery of St Nicholas (founded in 1768) was in 1862 successfully defended by a handful of men against the Turks.

History.—The history of Montenegro as an independent state begins with the battle of Kosovo (1389), but the country had enjoyed periods of independence or semi-independence at various epochs before that event. It formed a portion of the district of Praevalitana in the Roman province of Ilyria, and, lying on the borders of the empire of the West and East, it alternately fronted, and at Budimly in its neighbourhood, especially interesting and important are the extensive ruins of Dobele, now known as Dukle, the birthplace of the Emperor Dociot. The city, which received the franchise under the Flavian emperors, occupied a remarkable site at the junction of the rivers Zeta and Moratcha.

MONTENEGRO

After the fatal defeat of Kosovo, which extinguished the independence of Servia for more than four centuries (see Servia), George Babsha, the ruling prince of the Zeta, withdrew to the mountainous portion of his realm, which became an asylum for many of the Servian nobles and for others who had been outlawed or persecuted by the Turkish conqueror. The principality now owned no suzerain, and the history of its heroic struggle with the Turks began. The long record of warfare is varied by conflicts with the Venetians, who at times allied themselves with the mountaineers, but usually deserted them in the hour of need. The Babsha family became extinct in 1421, and a new dynasty was founded by Stephan Tzernoyevich, or Tzernovitch, who fixed his capital at Zhabliak on the north-east side of Lake Scutari, and joined with his relative, the famous Scanderbeg (q.v.), in many campaigns against the Turks. After the Turkish conquest of Bosnia in 1463, of the Herzegovina in 1476 and of Albania in 1478, and the surrender of Scutari to the Venetians in 1479, the Montenegrins found themselves surrounded on all sides by the Ottoman power, and the struggle was henceforth for existence. Abandoned by Venice and unable to obtain succour from any Christian state, Ivan the Black, the son and successor of Stephan, set fire to Zhabliak in 1484, and withdrew with his people to the mountain village of Tzetine (Cettigne) which has ever since been the capital of the little principality. Here he founded the famous monastery and created a bishopric in order to establish the spiritual power at the seat of government. Ivan was one of the greatest heroes of Montenegrin history; according to the national legend, he still sleeps in a cave near his fortress of Ohoden—to awake when the hour arrives for the expulsion of the Turks from Europe.

The Tzernoyevich dynasty came to an end in 1516, and from this date till 1606 the mountaineers were ruled by the vladas or bishops of Cettigne, elected by assemblies of the chiefs and people, and consecrated by the patriarch of Ipek. The elective vladas were aided in matters relating to national defence by a civil governor. The institution of a theocratic sovereignty probably saved the country from absorption in the Turkish Empire, the supreme power being vested in a sacerdotal person, whose position was unassailable by ambitious chieftains, and whose holy office precluded the possibility of his defection to Islam. The earlier vladas were left comparatively un molested by the Turks, and were enabled to devote their attention to the issue of numerous psalters, missals and gospels from the printing-press at Ohoden. But the beginning of the 17th century was marked by renewed Turkish aggression. Cettigne was taken in 1623 and again in 1687, when the monastery of Ivan the Black was blown up by the monks; a tribute was paid for a time imposed on the mountaineers, but the bolder spirits maintained their resistance in the heights, and the invading armies found it impossible to prolong their stay in these inhospitable regions.

In 1606 it was decided to continue the hereditary principle with the theocratic system, and Danilo Petrovitch of Njegush, the first ruler of the present reigning family, was nominated vlada with power to select his successor from among his relatives. The succession was henceforth regularly from uncle to nephew, owing to the royal title imposed by the Turks. The reign of Danilo I. was memorable for the massacre of the Montenegrins settled in the principality (the "Montenegrin vespers") on Christmas Eve 1702, the great defeat of the Turkish invaders at Tzarevlatz (1712), the capture of Cettigne by the Turks and the destruction for the third time of its monastery (1714), and the inauguration of the intimate relations which have ever since existed with Russia by the visit of the vlada to Peter the Great in 1715. With Russian aid Danilo was enabled to some degree to repair the ruin which had overtaken his little realm. In the time of his successor Sava (1735-1782) an impostor named Stephan Mali, who represented himself as the Russian emperor Peter III., won the confidence of the Montenegrins, and governed the country with ability for several years, as a result of the combined efforts of the Turks and Venetians to remove him. He was eventually assassinated by a Greek suborned by the pasha of Scutari. Peter I. (1782-1830), the greatest of the vladas, took part in the war of Austria and Russia against Turkey (1788-92), but was abandoned by his allies in the treaties of Sistova and Jassy. He nevertheless completely routed the Turks in the battle of Krussa (1790), annexed the Borda region to the principality, and obtained a formal recognition by the Sultan, which remained in force till 1809. In concert with the Russians he besieged the French in Ragusa (1806), and in 1813-14 expelled them from the Bocche di Cattaro with the aid of a British fleet under Admiral Fremantle. The much-coveted seaport, however, was almost immediately occupied by an Austrian force. Peter I. reorganized the internal administration and promulgated the first Montenegrin code of laws. After his death he was canonized as a saint by the people. His successor Peter II. (1830-1851), a poet, statesman and reformer, as well as a capable military chief, instituted a senate (1831), abolished the office of civil governor (1832), revived the national printing-press, and did much to educate and christianize his people. He was buried by his desire on the summit of Mount Lovchen that his spirit might survey his beloved land. He was the last of the vladas; his nephew Danilo II. (1851-1860) at once declined the ecclesiastical dignity, and assuming the title of gospodar, or prince, settled the succession on his direct male descendants. He defeated the Turks near Ostrog in 1853, but refrained from attacking them during the Crimean War. His pacific policy produced no result, and the Montenegrins were obliged to culminate in an open revolt. His demand for the recognition of Montenegrin independence and other claims were set aside by the Congress of Paris. In 1858 his brother Mirko, "the Sword of Montenegro," routed the Turks with great slaughter at Grahovo. In 1853 Danilo promulgated a new code, assuring civil and religious liberty to his subjects. On the 17th of August 1886 he was shot at Persano on the Bocche di Cattaro by a Montenegrin whom he had exiled after the revolt, and died two days afterwards. He left no male offspring, and was succeeded by Nicholas, the son of his brother Mirko.

 Shortly after the accession of Prince Nicholas (Aug. 13, 1860), an insurrection broke out in Herzegovina, and the sympathy which the mountaineers displayed with their Christian kinsmen led to a rupture with Turkey (1862). Notwithstanding the heroic defence of Ostrog by the prince's father, Mirko, the war proved disastrous, owing to the superior armament and discipline of the Turkish troops, and severe terms were imposed on the principality by the convention of Scutari (Aug. 31). During the fourteen years of peace which followed, the country suffered greatly from famine and pestilence. In the interval the reforms were carried out by the prince: the army was reformed and reorganized, an educational system was initiated, and a constitution under which the prince surrendered various prerogatives to the Senate was granted. In 1869 the Krivošians, or Serb inhabitants of the northern shores of the Bocche di Cattaro, rose against the Austrian government; the excitement in Montenegro was intense, but the prince succeeded in checking the warlike ardour of his subjects. The revolt in Bosnia and Herzegovina in 1875 had more important consequences for the prince. On the 12th of July 1878 Prince Nicholas, in alliance with Prince Milan of Servia, declared war against Turkey and invaded Herzegovina. A victory was gained at Vuchil (July 28), and Medun was captured; but the Servian army suffered reverses, and an armistice was arranged in November. In the following spring the determination of Russia to take the field against Turkey encouraged the Montenegrins to renew the war. The Turks succeeded in occupying Ostrog, but were subsequently repulsed; the greater part of their forces was soon withdrawn to Bulgaria, and Prince Nicholas captured successively Niksic, Antivari and Dulcigno. The recovery of the seaport, which belonged to Montenegro in the middle ages, was perhaps the principal achievement of the war. The enlargement of territory stipulated for by Russia under the treaty
of St. Stefano (March 3, 1878) would have brought Montenegro into close contiguity with Servia, thus facilitating the eventual union of the Serb race and closing the path of Austria towards the Aegean. The Berlin Treaty (article xxviii.) gave to Montenegro Nikashit, Spuzh, Podgoritza, Plava, Gusinye and Antivari, but restored Dulcigno to Turkey. The resistance of the Moslem inhabitants of Plava and Gusinya to annexation led to long negotiations, and eventually the "Corti Compromise" was agreed to by a conference of the Powers at Constantinople (April 18, 1880). Plava and Gusinya were to be restored to Turkey, while the Montenegrin frontier was extended so as to include the territories of the Kлементi tribes. This arrangement, which could hardly have proved successful, was not carried out by Turkey, and the Powers subsequently decided to annex Dulcigno to Montenegro in exchange for Plava and Gusinya. The Porte interposed delays, though consenting in principle, and the Albanian League (see ALBANIA) assumed a menacing attitude. On the 28th of September the fleets of the Powers under Admiral Seymour appeared off Dulcigno, and the British government shortly afterwards proposed to occupy Smyrna. On the 11th of November the Porte yielded; on the 21st of the same month of April 1878, Montenegro obtained possession of Dulcigno. The present frontier, as already described, was shortly afterwards delimited by an international commission. With the exception of some frontier troubles, the years since 1880 have been spent in peace, and the country has advanced in prosperity under the autocratic but enlightened rule of Prince Nicholas. The relations with Turkey, the traditional foe, have improved, while those with Austria have become less friendly. In July 1893 the four-hundredth anniversary of the foundation of the printing-press at Obod was celebrated at Cetinje, several foreign universities and learned bodies being represented at the festivities. In September 1896 the bicentenary of the Petrovitch dynasty was commemorated. The marriage in the same year of Princess Helen, fourth daughter of Prince Nicholas, with the crown prince of Italy, subsequently King Victor Emmanuel III., led to an increase of Italian influence in the principality. In December 1900 Prince Nicholas assumed the title "Royal Highness." In October 1906 the first Montenegro parliament assembled at Cetinje; and on the 28th of August 1910, Prince Nicholas (q.v.) assumed the title of king.

Among new works by Cetinje artists are the "Giamboni" (St. Petersburg, 1835); Wilkinson, "Dalmatia and Montenegro" (London, 1848); Vuk Karajich, "Montenegro und die Montenegriner (Stuttgart, 1857); Katay, "Geschichte der Serben von den ältesten Zeiten bis 1542" (Berlin, 1856); H. Schwicht, "Die esterischen Bauten in Budapestd, 1885); Servian trans., "Istorica Srpskog naroda" (Belgrade, 1876); Frilek and Wahalovitz, "Le Montenegro contemporain" (Paris, 1876); Rash, "Montenegro" (Leipzig, 1877); Milukovitch, "Storia del co-"Montenegro" (Ragusa, 1877); Coppiere Xilos Montenegrin und die Montenegriner (Leipzig, 1877); Vriarte, "Les Bords de l'Adriatique et le Montenegro (Paris, 1878); Stefanovitch von Vilovo, 'Wanderungen durch Montenegro' (Vienna, 1880); Chirdina, "Storia del Montenegro" (Spalato, 1882); Tietze, "Geologische Uebersicht von Montenegro" (Vienna, 1884); Rovinsky, "Tchernaga" (in Russian; St. Petersburg, 1888); Dudich, "Tzernaga" (in Servian; Belgrade, 1891); Medakovitch, "Pietro II. Pet crushed (Neusatz, 1892); Hanser, "Reise durch Montenegro" (Vienna, 1893); Coquelle, "Histoire du Montenegro et de la Bosnie" (Paris, 1895); Miller, "The Balkans," pp. 353-468 (London, 1896); Mantegazza, "Al Montenegro" (Florence, 1897); Tintoni, "Daghi Petrovitch Xiege auf Montenegro und Cetinje" (Berlin, 1899); Antonio Martini, "Montenegro und die Kunst," (in Fortnightly Review (December, 1898); Rouvarat, "Montenegro" (in Servian; Semin, 1899); Gelcaitch, "La Zedda e la dominia dei Balzard" (Spalato, 1890); R. Wyon and G. France, "The Land of the Black Mountain" (London, 1903). The best map is that of the Austrian staff.

MONTE OLIVETO MAGGIORE, a monastery of Tuscany, Italy. It was founded in 1326, and is mainly celebrated for the beautiful frescoes in the monastery court, which are by Luca Signorelli (1407-1468) and Antonio Bazzi, called Sodoma (1505), representing scenes from the legend of St. Benedict. The church and library contain fine inlaid woodwork by Fra Giovanni da Verona.

MONTEPULCIANO, a town and episcopal see of the province of Siena, Tuscany, Italy, 44 m. S.E. of Siena by rail. Pop. (1901), 6288 (town); 15,384 (commune). The town, 6 m. W. of the station, crowns the summit of a hill (1084 ft.), and is surrounded by medieval walls. It is not traceable in history before A.D. 715. It was under the protection of Siena till 1202, when it declared for Florence and thenceforward passed from one mistress to the other, until early in the 16th century when it finally became Florentine. In 1561 it became an episcopal see. Most of the buildings belong to the Renaissance; except the castle, the 14th-century Palazzo Pubblico, and the portals of two or three churches, especially that of S. Maria (13th century). There are a number of fine private houses, some built by Antonio da Sangallo the elder (1455-1534) and by Pero de' Rucellai (1421-1536) and others by Vignola (1507-1573). The beautiful church of the Madonna di S. Biagio—probably Sangallo's masterpiece—was built in 1518-1539. The cathedral built by Bartolommeo Ammanati (1570), modified by Ippolito Scalza, and completed in 1680 (with the exception of the façade, which is still unfinished) contains a large altar-piece by Taddeo di Bartolo of Siena, and the fragments of an imposing monument erected in 1427-1436 by the Florentine architect Michelozzo in honour of Bartolommeo Aragazì, secretary of Pope Martin V., which was taken down in the 18th century. The city lies (1877) probably also Michelozzo's work; Monteponciano is famous for its wine, and was the birthplace of the scholar and poet Angelo Anzoghi (1454-1494), generally known as Poliziano (Politian) and of Cardinal Bellarmine (1542-1621). See F. Bargagli-Petrucci, "Montepulciano, Chiusi," &c. (Bergamo, 1907).

MONTEREAU, a town of northern France, in the department of Seine-et-Marne at the confluence of the Yonne with the Seine, 21 m. S.E. of Melun by rail. Pop. (1900), 7870. The church dates from the 13th century, with a façade of the Renaissance period. The industries include the manufacture of porcelain, fire-proof and decorative bricks, boots and shoes and agricultural machines and colours, varnish, &c. Among the institutions are a tribunal of commerce and a chamber of arts and manufactures.

Monterea was in the beginning of the 15th century a place of some importance. Here, on the bridge over the Yonne, Jean Sans-Peur, duke of Burgundy was assassinated in the presence of the Dauphin, afterwards Charles VII., in 1459. The city lies (1877) probably also Michelozzo's work; in the wars of religion it was several times taken and retaken. In 1814 Napoleon gained a victory at Monterea over the Württemberg troops under Schwarzenberg, and in memory of this his statue has been erected on the bridge.

MONTEREY, a city of Monterey county, California, U.S.A., on the Pacific coast, about 90 m. in a straight line S. by E. from San Francisco, at the S.E. extremity of the Gulf of Monterey, a great open bay 22 m. wide from headland to headland and facing W.S. The harbour is protected by a peninsula extending N.W. Pop. (1900), 1748, largely of Spanish descent; (1910) 5469.

It is served by the Southern Pacific railroad, and for freight by the Pacific Coast Steamship Co. It is built in an amphitheatre formed by gently sloping pine-clad hills. In 1881 the Southern Pacific Company erected the Del Monte hotel, with beautiful grounds several miles in extent, and since then the city has come to be one of the favourite resorts of the Pacific coast. The difference between the mean temperatures of the coldest and warmest months of the year (rarely below 41° or above 66° F. respectively) is from 13″ to 20″, while the thermometer rarely rises above 85° F. Within the city limits there is a United States Army post, the Presidio of Monterey, with a musketry school. There are sardine canneries here and good salmon and other fishing; some salmon are shipped to Germany to be smoked. In 1907 the south side of the Gulf of Monterey was made by the state legislature into a preserve for squid and other food for salmon. To San Francisco, Hawaii, Alaska, and elsewhere, Monterey ships annually about 60,000 tons of crude oil, piped here into great steel tanks from the Coalingas oil fields 112 m. away. Sand lime brick is manufactured here.
Before the coming of the Americans, Monterrey was the gayest and most important city of California. It was discovered by Sebastian Vizcaino in December, 1602, and was named in honour of the then vice-roy of New Spain. For a time all trace was lost of Monterrey, but in May 1770 the bay was found again by Junipero Serra and Captain Gaspar de Portolá. The San Carlos mission of the Franciscans was founded on the 3rd of June 1770, and a presidio was completed in 1778. Near Monterrey, in Carmel Valley, whither the mission was almost immediately removed, Father Junipero built a church, in which his remains now rest. In 1801 a statue, representing Junipero stepping from a boat, was erected on the site of the old Mexican fort, on a hill near the present place of business; and in the 19th century Monterrey necessarily played a prominent part in the jealousies that divided the north and south; the rivalry of Los Angeles for the dignity of the capital being a powerful influence in politics from 1827-1846. In 1843 Los Angeles gained the prize, but in 1847 the American authorities again made Monterrey the capital. Even in these years the treasury, custom-house and military headquarters had remained at Monterrey. In 1818 it was captured and momentarily held by a Buenos Aires privateer. Here, in 1842, Commodore T. ap C. Jones raised the flag of the United States for the 2d time here, on the 17th July 1846. Commodore J. D. Sloat again raised the same flag, which this time was not to come down again. The first American newspaper on the Pacific coast was published at Monterrey; and the convention that framed the first constitution of the state met here in September 1849 in Colton Hall, still standing and originally built for a schoolhouse by Walter D. Colton, the first alcalde under American rule. Monterrey was never the capital of the new state, and its importance declined after the discovery of gold near Sacramento, San Francisco becoming the leading city. In 1872 the county-seat was removed from Monterrey to Salinas. For many years Monterrey remained one of the most Spanish towns of California, and though tourists have somewhat disturbed its peace and checked its decay, it still retains much of the quaint aspect and the drowsy contentment of spirit of Mexican days. Since 1900 the population has considerably increased.

MONTERREY (usually spelled Monterrey in English), a city of Mexico and capital of the state of Nuevo León, 606 m. by the old wagon road, and 671 m. by the Mexican National railway N. by W. of the city of Mexico, in lat. 25° 7' N., long. 99° 50' W. Pop. (1900), 62,266. Railway communications are provided by the Mexican National with the United States, with the national capital and southern Mexico, and with Matamoros, and by the Belgian line with Tampico on the Gulf coast, and with Tresviño, or Venadito, on the Mexican International line, which gives access to the iron deposits of Durango. The city stands 1624 ft. above sea-level, between two spurs of one of the Sierra Madre ranges—the Cerro de la Silla (4149 ft.) on the east, and the Cerro de las Mitras (3618 ft.) on the west. The Santa Catarina river furnishes water-power for some of its industries. The surrounding district is fertile, and the rainfall varies about 22 in. The climate is dry and mild, and the city is frequented in winter by invalids from the United States. Monterrey is laid out with broad, straight streets crossing each other at right angles, and spread over a large area. It is the see of the bishop of Linares, and has a large cathedral, a bishop's palace and numerous churches. Among the public edifices are the government palace, municipal hall, national college, girls' college, medical school, public hospital, theatre and penitentiary. Its public buildings include the 19th and 17th century buildings, called the "Ojo de Agua," and the "Puente Nuevo" (new bridge). Monterrey is the most important centre of northern Mexico, and large sums of foreign capital have been invested in its industries. Among its manufactures are woolen mills, smelting works, brass and iron foundries, a steel producing plant, saw-mills, flour-mills, breweries, and a carriage and wagon factory.

Monterrey was founded in 1560 under the name of Santa Lucía de Léon; and in 1596, as Monterrey, was raised to the dignity of a city. In 1777 it became the see of a bishop, now sufragán to the archbishop of Guadalajara. During the war between Mexico and the United States General Zachary Taylor arrived before the city on the 19th of September 1846, with about 6000 men. Monterrey was defended by a Mexican force of about 10,000 under General Pedro de Ampudia. On the 20th Colonel John Garland (1792-1861) assaulted the lower (northeastern) part of the city; he was driven back, but captured one of the forts. The attacks on the other forts on the east were unsuccessful. On the 21st and 22nd General W. J. Worth carried the forts west of Monterrey, and on the 23rd attacked the western part of the city, the troops slowly working their way toward the central plaza. On the same day American and Mexican troops met again on the Guadalajara and Monterrey roads. On the morning of the 24th the terms of a capitulation were agreed upon—the Mexicans were permitted to retire, retaining their small arms and one field battery of six pieces with twenty-one rounds of ammunition, and an armistice of eight weeks was arranged. A disastrous flood, caused by heavy rains and the sudden overflow of the Santa Catarina river on the 28th of August 1909, swept away about one-fourth of the city, drowning 1200-1400 persons, and destroying about $80,000,000 (Mex.) worth of property.

MONTE SAN GIULIANO, a town and episcopal see of Sicily, in the province of Trapani, 2 m. E.N.E. of Trapani, on the summit of an isolated bare hill, 2465 ft. above the sea. Pop. of commune (1901), 28,939; of town, about 3000. The town occupies the site of the ancient Eryx, a city of the Elymii, a people who claimed to be sprung from a mixed settlement of Trojans and Phocians after the fall of Troy (E. A. Freeman, History of Sicily, i. 195, 542), but regarded as Βάρβαρος by the Greeks. The city was famous for the temple of Venus Erycina, to the foundations of which a wall of 12 courses of masonry in the castle probably belongs. It was a relic of the Phoenician cult of Astarte. In 415 B.C. the Athenian ensigns were shown the treasure of the temple at Eryx as available for the expenses of the war, which treasure turned out to be only silver-gilt and not of solid gold (Thucydides vi. 46). The town must have become a part of the Carthaginian dominion in 405 B.C. It was seized by Pyrrhus in 275 B.C., and was ceded to Rome at the end of the First Punic War. In Roman times the temple (like that of Diana Tifatana, near Capua) possessed territory of its own, being dependent neither on the state nor on any neighbouring province, and a considerable number of female slaves. The place was the residence of the quaestor in charge of the western half of the island, and Verres, as praetor, seems to have spent a good deal of time here. Considerable portions of the city wall are preserved on the north-west; on the east and south the precipitous cliffs formed a sufficient defence. The remains date from a reconstruction of Roman times,1 in which the material of two earlier periods has been used: the large blocks belonging to the original fortifications bear Phocianic masons' marks; but the long line of towers at regular intervals is a thoroughly Roman characteristic. The castle, dating from the middle ages, with three lofty towers guarding the entrance, occupies the south-eastern extremity of the town. The cathedral, founded in 1314, has a fine porch and Gothic façade.

MONTE SAN SAVINO, a town of Tuscany, Italy, in the province of Arezzo, from which it is 12 m. S.B.W. by road, 1083 ft. above sea-level. Pop. (1901), 4810 (town); 8408 (commune). It was the birthplace of the sculptor and architect Andrea Contucci, generally known as Sansovino (1460-1526), and there are several works in the town by him, a loggia opposite the Palazzo Municipale (itself an earlier work of Sangallo the elder and one of his best works), the monastery courts of S. Agostino and S. Giovanni Battista, and some sculptures.

MONTE SANT' ANGELO, a town of Apulia, Italy, in the province of Foggia, 10 m. N. of Manfredonia by road, 2765 ft. above sea-level, on the southern slopes of Monte Gargano. Pop. (1901), 17,369 (town); 21,997 (commune). It has a castle and a famous church.

1This has been demonstrated by O. Richter, Über antike Steinmetzzeichen (Berlin, 1885), pp. 43-51.
sanctuary of S. Michele, founded in 491 over a cave in which the archangel is said to have appeared to S. Laurentius, archbishop of Spontum; the bronze doors, made in Constantinople, bear the date 1076. The octagonal campanile dates from 1273. The portal of S. Maria Maggiore is noteworthy. The Torba di Rotary is a domed building of the Norman period. To the north lies the highest point of the Monte Gargano (3460 ft.). Strabo speaks of an oracle of Calchas on the top of the mountain, and a healing spring at Podalirius at the bottom, 12 m. from the sea.

See S. Beltramelli, Il Gargano (Bergamo, 1907).

**MONTESPAN—MONTESQUIEU**

Marquise de (1641–1707), mistress of Louis XIV., was born at the château of Tonnay-Charente (Charente-Inférieure), the daughter of Gabriel de Rochcourage, duc de Mortemart. She was educated at the Convent of St Mary at Saintes, and when she was twenty she became maid-of-honour to Queen Maria Theresa. She married in January 1663 L. H. de Pardailhan de Gondrin, marquis de Montespans, who was murdered by his own servants. By him she had two children, L. H. Pardailhan de Gondrin, duc d'Antin, born in 1665, and a daughter. Her brilliant and haughty beauty was only one of the Montespans' charms; she was a cultivated and amusing talker who won the admiration of such competent judges as Saint-Simon and Mme de Sévigné. Nevertheless she was a profound believer in witchcraft, and in Reuilly, the chief judge of the court before which the famous poisoning cases were brought, places her first visits to La Voisin (q.v.). She received from the sorceress a potion, said to have been kept for the past three years, for Louis XIV., and in 1666 the "black mass" was said by the priest Étienne Guibourg over her with the usual horrible ceremonial. In 1669 she gained her end, becoming Louis XIV.'s mistress in July. Montespans astounded the court by openly resisting his wife's position. He made a scandal by accusing Mme de Montausier of acting as go-between to secure the governorship of the dauphin for her husband. He even wore mourning for his wife. Montespans was arrested, but released after a few days' imprisonment. The first of the seven children whom Mme de Montespans bore to the king was born in March 1669, and was entrusted by Mme Scarron, the future Mme de Maintenon, who acted as companion to Mme de Montespans while the king was away at the wars. Her children were legitimized in 1673 without mention of the mother's name for fear that Montespans might claim them. The eldest, Louis Auguste, became duc de Maine, the second, Louis César, comte de Vexin, and the third, Louis Françoise, demoiselle de Nantes (afterwards duchess of Bourbon). Meanwhile Montespans had been compelled to retire to Spain, and in 1674 an official separation was declared by the procurateur-général (procurer of Harlay, assisted by six judges at the Châtelet). The king, Louis's affections showed signs of cooling. Mme de Montespans had recourse to magic. In 1675 absolution was refused to the king, with the result that his mistress was driven from the court for a short time. It has been thought that she had conceived the intention of poisoning even as early as 1676, but in 1679 Louis's intrigue with Angélique de Fontanges and her own relegation to the position of superintendent of the queen's household brought matters to a crisis. Mme de Fontanges died a natural death in 1671, though poisoning was suspected. Meanwhile suspicion was thrown on Mme de Montespans's connection with La Voisin and her crew by the frequent recurrence of her maid's name, Mlle Desoeillet, in the evidence brought before the Chambre Ardente. From the end of 1680 onwards Louvois, Colbert and Mme de Maintenon all helped to hush up the affair and to prevent further scandal about the mother of the king's legitimized children. Louis XIV. continued to spend some time in her apartments, and apparently her brilliance and charm in conversation mitigated to some extent her position of discarded mistress. In 1691 she retired to the Convent of St Joseph with a pension of half a million francs. Her father was governor of Paris, her brother, the duc de Vivonne, a marshal of France, and one of her sisters, Gabrielle, whose vows were but four years old, became abbess of the community of Fontevrault. Besides the expenses of her houses and equipage Mme de Montespans spent vast sums on hospitals and charities. She was also a generous patron of letters, and befriended Corenne, Racine and La Fontaine. The last years of her life were given up to penance. When she died at Bourbon l'Archambault on the 27th of May 1697 the king forbade her children to wear mourning for her. Representations were made for her by her maid-of-honour, Bonne, for her younger children—Françoise Marie, Mlle de Blois (1677–1749), married in 1692 to the future regent Orleans, then duc de Chartres, and Louis Alexandre, comte de Toulouse (1678–1737).

See P. Clément, Madame de Montespans et Louis XIV. (Paris, 1869); monographs by Arsène Housaye (1865) and by H. Williams (1896); and J. Jair, La Voisin et les sorciers de France (1903); Durand, "Un épisode du grand règne" in Rev. des questions hist. (Paris, 1868); the contemporary memoirs of Mme de Sévigné, of Saint-Simon, of Bussy-Rabutin and others; also the proceedings of the Chambre Ardente preserved in the Archives de la Bastille (Arsenal Library) and the notes of La Reynie preserved in the Bibliothèque Nationale. She figured in V. Sandow's play, L'Affaire des poisons (1907).

**MONTESQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE LA BRÊDE ET DE (1689–1755), French philosophical historian, was born at the château de La Brède, about 10 m. south-east of Bordeaux, in January 1689, and was baptized on the 18th of that month. His mother was Marie Françoise de Penel, the heiress of a Gascon-English family. She had brought La Brède as a dowry to his father, Jacques de Secondat, a member of a good if not extremely ancient house, which seven generations had been connected with the history of the early days of the 17th century. The title of Montesquieu came from his uncle, Jean Baptiste de Secondat, "président à mortier" in the parliament of Béarn—a man of importance, which, as well as his title, he left to his nephew. Montesquieu was in his youth known as M. de la Brède. His mother died when he was seven years old, and when he was eleven he was sent to the Oratorian school of Juilly, near Meaux, where he stayed exactly five years, and where, as well as afterwards at Bordeaux, he was thoroughly educated. The family had long been connected with the law, and Montesquieu was destined for that profession. His father died in 1713, and a year later Montesquieu was admitted counsellor of the parliament. In little more than another twelvemonth he married Jeanne Larigue, an heiress and the daughter of a knight of the order of St Louis, but plain, somewhat ill-educated, and a Protestant. Montesquieu does not seem to have made the slightest pretense of affection or fidelity towards his wife, but there is every reason to believe that they lived on perfectly good terms. In 1716 his uncle died, leaving him his name, his important judicial office and his whole fortune.

The book intended to hold his presidency for twelve years, and took part in the proceedings of the Bordeaux Academy, to which he contributed papers on philosophy, politics and natural science. He also wrote much less serious things, and it was during the earlier years of his presidency that he finished, if he did not begin, the Lettres persanes. They were completed before 1721, and appeared in that year anonymously, with Cologne on the title-page, but they were really printed and published at Amsterdam. In the guise of letters written by and to two Persians of distinction travelling in Europe, Montesquieu not only satirized the fashionable court at Paris, but his political, ecclesiastical and literary follies of his day in France, but indulged in a great deal of the free writing which was characteristic of the tale-tellers of the time. But what scandalized grave and precise readers naturally attracted the majority, and the Lettres persanes were very popular, passing, it is said, through four editions within the year, besides piracies. Then the vogue suddenly ceased, or at least editions ceased for nearly nine years to appear. It is said that a formal ministerial prohibition was the cause of this, and it is not improbable; for, though the regime of the Duke did enjoy some political idol, thoroughly, they were both shrewd enough to perceive that underneath its playful exterior there lay a spirit of
very inconvenient criticism of abuses in church and state. The fact is that the Lettres persanes is the first book of what is called the Philosophes movement. It is amusing to find Voltaire describing the Lettres as a "trumpetry book," a "book which anybody might have written easily." It is not certain that, in its peculiar mixture of light badinage with not merely serious purpose but gentlemanlike moderation, Voltaire could have written it himself, and it is certain that no one else at that time could.

The reputation acquired by this book brought Montesquieu more into the literary society of the capital, and he composed for, or at any rate contributed to, one of the coteries of the day the clever but rather rhetorical Dialogue de Sylla et d'Euclaire, in which the dictator gives an apology for his conduct. For Mlle de Clermont, a lady of royal blood, a great beauty and a favourite queen of society, he wrote the curious prose-poem of the Temple de Gnide. This is half a narrative, half an allegory, in the semi-classical or rather pseudo-classical taste of the time, decidedly frivolous and dubbiously moral, but of no small elegance in its peculiar style. A later jeu d'esprit of the same kind, which is almost but not quite a Montesquieu's, is the Voyage à Paphos, in which his warmest admirers have found little to praise. In 1725 Montesquieu was elected a member of the Academy, but an almost obsolete rule requiring residence in Paris was appealed to, and the election was annulled. It is doubtful whether a handkerchief after Parisian society, or an ambition to belong to the Academy, or a desire to devote himself to literary pursuits of greater importance, or simple weariness of not wholly congenial work determined him to give up his Bordeaux office. In 1726 he sold the life-tenure of his office, reserving the reversion for his son, and went to live in the capital, returning, however, for half of each year to La Brède. There was now no further formal obstacle to his reception in the Académie Française, but a new one arose. Ill-wishers had brought the Lettres persanes specially under the minister André Hercule de Fleury's attention, and Fleury, a precise in many ways, was shocked by them. There are various accounts of the way in which the difficulty was got over, but all seem to agree that Montesquieu made concessions which were more effectual than dignified. He was elected and received in January 1728. Almost immediately afterwards he started on a tour through Europe to observe men, things and constitutions. He travelled through Austria to Hungary, but was unable to visit Turkey as he had proposed. Then he made for Italy, where he met Chesterfield. At Venice, and elsewhere in Italy, he remained nearly a year, and then journeyed by way of Piedmont and the Rhine to England. Here he stayed for some eighteen months, and acquired an admiration for English character and politi which never afterwards deserted him. He returned, not to Paris, but to La Brède, and to outward appearance might have seemed to be settling down as a squire. He altered his park in the English fashion, made sedulous inquiries into his own genealogy, arranged an entabl, asserted, though not harshly, his seignorial rights, kept poachers in awe and so forth. But these matters by no means engrossed his thoughts. In his great study at La Brède (a hall rather than a study, some 60 ft. long by 40 wide) he was constantly dictating, making abstracts, revising essays, and in other ways preparing his main book. He may have thought it wise to soften the transition from the Lettres persanes to the Esprit des lois, by interposing a publication graver than the former and less elaborate than the latter. The Considerations sur les causes de la grandeur et de la décadence des Romains appeared in 1734 at Amsterdam, without the author's name. This, however, was perfectly well known; indeed, Montesquieu formally presented a copy to the French Academy. But the author's reputation as a jester stuck to him, and the salons affected to consider the Lettres persanes and the new book respectively as the "grandeur" and the "décadence" of M. de Montesquieu; but more serious readers at once perceived its extraordinary merit, and it was eagerly read abroad. A copy of it exists or existed which had the singular misfortune to be annotated by Frederick the Great, and to be abstracted from the Potsdam library by Napoleon. It is said, moreover, by competent authorities to have been the most enduringly popular and the most widely read of all its author's works in his own country, and it was certainly been the most frequently and carefully edited. Merely scholastic criticism may of course object to it, as to every other book of the time, the absence of the exactness of modern critical inquiry into the facts of history; but the virtue of Montesquieu's book is in its views, not in its facts. It is (putting Bossuet and Giovanni Vico aside) almost as important a work as the philosophy of history. The point of view is entirely different from that of Bossuet, and it seems entirely improbable that Montesquieu knew anything of Vico. In the Grandeur et décadence the characteristics of the Esprit des lois appear with the necessary subordination to a narrower subject. Two things are especially noticeable in it: a peculiarity of style, and a peculiarity of thought. The style has a superficial effect. The page is broken up into short paragraphs of but a few lines each, which look very ugly, which irritate the reader by breaking the sense, and which prepare him to expect or at least to avoid the prophetical or absolute style. On the contrary, the merit of the expression is very great, it is grave and destitute of ornament, but extraordinarily luminous and full of what would be called epigram, if the word epigram had not a certain connotation of flippancy about it. It is a very short book; for, printed in large type with tolerably abundant notes, it fills but two hundred pages in the standard edition of Montesquieu's works. But no work of the century, except Turgot's second Sorbonne Discours, contains, in proportion to its size, more weighty and original thought on historical subjects, while Montesquieu has over Turgot the immense advantage of style.

Although, however, this ballon d'essay, in the style of his great work, may be said to have been successful, and though much of that work was, as we have seen, in all probability already composed, Montesquieu was in no hurry to publish it. He went on "cultivating the garden" diligently both as a student and as an improving landowner. He wrote the sketch of Lysimaque for Stanislaus Leszczinski; he published new and final editions of the Temple de Gnide, of the Lettres persanes, of Sylla et Euclaire (which indeed had never been published, properly speaking). After allowing the Grandeur et décadence to be reprinted without alterations some half-dozen times, he revised and corrected it. He also took great pains with the education of his son Charles and his daughter Denise, of whom he was extremely fond. He frequently visited Paris, where his favourite resorts were the salons of Mme de Tencin and Mme d'Aiguillon. Yet it seems that he did not begin the final task of composition till 1734. Two years of uninterrupted work at La Brède finished the greater part of it, and two more the rest. It was finally published at Geneva in the autumn of 1748, in two volumes quarto. The publication was, however, preceded by one of those odd incidents which in literature illustrate Clive's well-known saying about courts-martial in war. Montesquieu summoned a committee of friends, according to a very common practice, to hear and give an opinion on his work. It was an imposing and certainly not an unfriendly one, consisting of Charles Jean François Hénault, Helvétius, the financier Etienne de Silhouette, the dramatist Joseph Saurin, Crébillon the younger, and, lastly, Fontenelle—in fact, all sorts and conditions of literary men. They unanimously advised the author not to publish a book which has been described as "one of the most important books ever written," and which may be almost certainly ranked as the greatest book of the French 18th century.

Montesquieu, of course, did not take his friends' advice. In such cases no man ever does, and in this case it was certainly fortunate. The Esprit des lois represents the reflections of a singularly clear, original, and comprehensive mind, corrected by forty years' study of men and books, arranged in accordance with a long deliberated plan, and couched in language of remarkable freshness and idioms. In the original editions the full title runs L'Esprit des lois: ou du rapport que les lois
doivent avoir avec la constitution de chaque gouvernement, les mœurs, le climat, la religion, le commerce, &c. It consists of thirty-one books, which in some editions are grouped in six parts. Speaking summarily, the first part, containing eight books, deals with law in general and with forms of government; the second, containing five, with military arrangements, with taxation, and much unfinished matter dated from the and customs, and their dependence on climatic conditions; the fourth, containing four, with economic matters; and the fifth, containing three, with religion. The last five books, forming a kind of supplement, deal specially with Roman, French, and feudal law. The most noteworthy peculiarity of the book to a cursory reader lies in the section dealing with effects of climate, and this indeed was almost the only characteristic which the vulgar took in, probably because it was easily susceptible of parody and reductio ad absurdum. The singular spirit of the present work that distinguishes its views on politics and religion was indeed rather against it than in its favour in France, and Helvétius, who was as outspoken as he was good-natured, had definitely assigned this as the reason of his unfavourable judgment. On the other hand, if not destructive it was sufficiently critical, and it thus raised enemies on more than one side. It was long suspected, but is now positively known, that the book (not altogether with the goodwill of the pope) was put on the Index, and the Sorbonne projected, though it did not carry out, a regular censure. To all these objectors the author replied in a masterly défense; and there seems to be no foundation for the late and scandalous stories which represent him as having used Mme de Pompadour's influence to suppress criticism. The fact was that, after the first snarlings of envy and incompetence had died away, he had little occasion to complain. Even Voltaire, who was his decided enemy, was forced at length to speak in public, if not in private, complimentarily of the Esprit, and from all parts of Europe the news of success arrived.

Montesquieu enjoyed his triumph rather at La Brède than at Paris. He was becoming an old man, and, unlike Fontenelle, he does not seem to have preserved in old age the passion for society which had marked his youth. He certainly spent much of his later years in the country, though he sometimes visited Paris, and on one visit procured the release of his admirer Laurent Angliviel de La Beaumelle from an imprisonment which La Beaumelle had suffered at the instance of Voltaire. He is said also to have been instrumental in obtaining a pension for Alexis Piron. Nor did he by any means neglect literary composition. The curious little romance of Arsace et Ismétène, a short and unfinished treatise on Taste, many of his published Pensées mortelles, and an unsigned article on "Mme de Pompadour," are probably the only works of a subsequent to the Esprit des lois. He did not, however, live many years after the appearance of his great work. At the end of 1754 he visited Paris, with the intention of getting rid of the lease of his house there and finally retiring to La Brède. He was shortly after taken ill with an attack of fever, which seems to have affected the lungs, and in less than a fortnight he died, on the 10th of February 1755, aged sixty-six. He was buried in the church of St Sulpice with little pomp, and the Revolution obliterated all trace of his remains.

The last portrait of Montesquieu and his position, actual and historical, in the literature of France and of Europe, are of unusual interest. At the beginning of the next century the vicomte de Bonald classed him with Racine and Bossuet, as the object of a "religious veneration" among Frenchmen. But Bonald was not quite a suitable spokesman for France, and it may be doubted whether the author of the Esprit des lois has ever really occupied any such position in his own country. For a generation after his death he remained indeed the idol and the great authority of the moderate reforming party in France. Montesquieu is not often quoted, or quoted, at the present day, and the exact criticism of our time challenges the accuracy of his facts. Although he was really the founder, or at least one of the founders, of the sciences of comparative politics and of the philosophy of history, his descendants and followers in these sciences think they have outgrown him. In France his popularity has always been dubious and contested. It is a singular thing that for more than a century there was no properly edited edition of his works, and nothing even approaching a complete biography of him, the place of the latter being occupied by the meagre and rhetorical Éloges de the most curious. For the moment, we may read all at France 10-day, and they attempt to explain the fact by confessing that Montesquieu, great as he is, is not altogether great according to French principles. It is not only that he is an Anglo-maniac, but that he is rather English than French in style and thought. He is almost entirely dispassionate in politics, but he lacks the unswerving deductive consistency which Frenchmen love in that science. His wit, it is said, is quaint and a little provincial, his style irregular and in no definite genre.

Some of these things may be allowed to exist and to be defects in Montesquieu, but they are balanced by merits which render them almost insignificant. It is on his three principal works that his fame does and must rest. Each one of these is a masterpiece in its kind. It is doubtful whether the Lettres persanes yield at their best either in wit or in giving lively pictures of the time to the best of Voltaire's similar work, though they are more unequal. There is, moreover, the great difference between Montesquieu and Voltaire that the former is a rational reformer, and not a mere persiflard or frondeur, to whom fault-finding is more convenient than acquiescence for showing off his wit. Of course this last description does not fully or always describe Voltaire, but it often does. It is seldom or never applicable to Montesquieu. Only one of Voltaire's own charges against the book and its author must be fully allowed. He is said to have replied to a friend who urged him to give up his habit of sneering at Montesquieu, "Il est coupable de lèse-poésie," and this is true. Not only are Montesquieu's remarks on poetry childish (he himself occasionally wrote verses, and very bad ones), but he is never happy in purely literary appreciation. The Considerations are noteworthy, not only for the complete change of style (which from the light and mocking tone of the Lettres becomes grave, weighty and sustained, with abundance of striking expression), but for the profundity and originality of the views, and for the completeness with which the author carries out his plan. These words—except, perhaps the last clause—apply with increasing force to the Esprit des lois. The book has been accused of desultoriness, but this arises, in part at least, from a misapprehension of the author's design. At the same time, it is impossible to deny that the equivocal meaning of the word "law," which has misled so many reasoners, has kept many from following his thought, and which, however, he keeps the promise of his sub-title (given above) with fidelity, and applies it with exhaustive care. It is only in the last few books, which have been said to be a kind of appendix, that something of irrelevancy suggests itself. The real importance of the Esprit des lois, however, is not that of a formal treatise on law, or even on polity. It is that of an assemblage of the most fertile, original and inspiriting views on legal and political subjects, put in language of singular suggestiveness and vigour, illustrated by examples which are evident and luminous, who should have been born and who has been born with an unflagging and tolerant desire for human improvement and happiness, and almost unique in its entire freedom at once from doctrinairism, from visionary enthusiasm, from egotism, and from an undue spirit of system. As for the style, no one who does not mistake the definition of that much used and much misused word can deny it to Montesquieu. He has in the Esprit little ornament, but his composition is wholly admirable. Yet another great peculiarity of this book, as well as of the Considerations, has to be noticed. The genius of the author for generalization is so great, his instinct in political science so sure, that even the falsity of his premises frequently fails to invalidate his conclusions. He has known wrong, but he has thought right.

The best edition of Montesquieu is that of Edouard Laboulaye (7 vols., Paris, 1875-1879), the best biography that of Louis Vian
MONTESQUIOU-FÉZENSAC—MONTEVIDEO

(Paris, 2nd ed., 1879). The bibliography of Montesquieu was dealt with by L. Dangeau in 1874. There is known to exist at La Brède a great mass of MS. materials for this great work, and several Parisian libraries contain copies of the letters of the C. and fragments of all kinds, diary, letters, notebooks and so forth. The present possessors, however, who represent Montesquieu, long refused permission to examine these to all other collectors, and they were chiefly known by a paper contributed in 1834 to the Transactions of the Academy of Agen. At last in 1891 Baron Charles de Montesquieu published Deux opuscules of his ancestors, and in 1899 Baron Gaston de Roederer, who claims Montesquieu added Penetres, &c. Working, however, of much interest has yet appeared. For a thorough student L'Esprit de Montesquieu by A. Charaux (1889) has value, for it is written, with some ability, from a point of view that of that of a man of letters. Rollet's Catholic and parliamentary and anglophone critic, who regards Montesquieu as an "evangelist of social atheism" and the like. The view is quite untenable but useful as a corrective. An article by Churton Collins on "Montesquieu in England" (Quarterly Review, No. 394, April 1903) may also be consulted.

G. S. A.

MONTESQUIOU-FÉZENSAC, ANNE PIERRE, MARQUIS DE (1739-1798), French general and writer, was born in Paris on the 17th of October 1739, of an ancient family of Armagnac. He was brought up with the children of the king of France, and showed some taste for letters. He entered the regiment of 1754, sukceded colonel of the Grenadiers and the Royal-Vauban regiment, and in 1780 was made maréchal-de-camp. Some pieces of verse and several comedies gained him admission to the French Academy in 1784. He was elected deputy to the states general of 1789 by the nobles of Paris, and, animated by Liberal ideas, he soon joined the Third Estate, and seconded Necker's financial schemes. He served on the committee charged with the issue of assignats, and was named president of the Constituent Assembly on the 14th of March 1791. In May 1791 he was promoted lieutenant-general, served under Lafayette, and in February 1793 was given the command of the Army of the South. In September of the same year he completed the conquest of Savoy, but in November 1792 he was accused of royalist leanings, and had to take refuge in Switzerland. In 1793 his name was erased from the list of émigrés and he returned to Paris, where he died on the 30th of December 1798.

See P. L. Roederer, Élégie de Montesquieu, reprinted in Roederer's Works (1835-1839).

MONTESSEON, CHARLOTTE JEANNE BÉRAUD DE LA HAYE DE RIOU, MARQUISE DE (1737-1805), was born in Paris of an old Breton family. About 1754 she married Jean Baptiste, marquis de Rivières, who died in 1766. Her beauty and intelligence attracted the attention of Louis Philippe, duke of Orleans, whom she secretly married in 1773 with the authorization of the king. For her husband's amusement she set up a little theatre and wrote several plays, in the acting of which she herself took part. She was imprisoned for some time during the Terror, but was released after the fall of Robespierre, became the friend of the empress Josephine, and was a prominent figure at the beginning of the empire.

The best edition of her works appeared under the title of Œuvres anonymes in 1783-1785. See Charles Collé, Journal (1868); the Mémoirs of St Simon, Madame de Genlis, the duchesse d'Abrantes and Mine de Levis; G. Strenger, "La Société de la marquise de Montessoson," in the Nouvelle revue (1902); J. Turquin, Madame de Montesson domicilie d'Orleans (Paris, 1905); and G. Loison and R. Ivé-Plessis, Les Théâtres clandestins du xixe siècle (1904).

MONTEVERDE, CLAUDIO (1556-1633), Italian priest and musician, was born in Cremona in May 1556; he was engaged at an early age as violinist to the duke of Mantua, and studied composition under Ingegneri, the duke's maestro di capella. His bold experiments, while bringing upon him the attacks of Artusi and Banchieri (q.v.), led to discoveries which exercised a lasting influence upon the progress of musical art. He was the first to make deliberate use of unprepared dissonances, or what are now known as fundamental discords. These dissonances revolutionized the whole texture of the church music. He employed them first in his madrigals, which are a sign of decadence, but afterwards introduced them into music of another kind with such excellent effect that their value was universally recognized. Before 1595 Montevede was married to the singer Claudia Cattaneo, who died in 1607. In 1602 he succeeded Ingegneri as maestro di capella; and in 1607 he produced, for the marriage of Francesco Gonzaga, his first opera, Ariana, in which he employed the newly-discovered discords with irresistible effect. Though he did not invent the lyric drama—Peri's Euridice having been produced at Piacenza in 1600—he raised it to a level which distanced all contemporary competition. His second opera, Orfeo, composed in 1608, was even more successful than Ariana. In 1613 Montevede was invited to Venice, as maestro di capella at St Mark's, with a stipend of 300 ducats, which in 1616 was raised to 400. Here he composed much sacred music, the greater part of which is lost. In 1630 he wrote another grand opera, Proserpina rapita. He did not become a priest until 1632. In 1639 he produced L'Adone, and in 1641 Le Nozze di Eneo and Il Ritorno d'Ulisse. He died in Venice on the 29th of November 1643. Montevede's harmonic innovations and power of musical rhetoric seemed to put an end to the school of Palestrina, and led the way to modern music. (See MUSIC.)

MONTEVIDEO, SAN FELIPE Y SANTIAGO DE, capital and chief port of Uruguay, and capital of the department of Monte-video, on the northern shore of the Rio de la Plata estuary, 120 m. E.S.E. of Buenos Ayres, in lat. 34° 34' 33" S., long. 56° 12' 18" W. Pop. (1908, estimate), 312,946. The old city (ciudad vieja) occupies a low rocky headland that projects westward into the estuary and an almost circular bay which forms the harbor. This harbor is defended by small forts, all of which have been removed. The new city (ciudad nueva and ciudad novissima) extends eastward over a beautiful tract of rolling country and is extending northward around the eastern shore of the bay. The site of the old city resembles a whale's back in shape; it slopes gently to its western extremity at Punta Sarandi and to the water's edge on either side. The general plan is that of rectangular squares, except at the western extremity of the old city and its union with the newer or extra-mural city, on the line of the old ramparts, known as Calle de la Ciudadela. The streets are well paved and have sufficient slope at all points to give easy surface drainage; Montevideo has the reputation of being one of the cleanest cities of the world. The rainfall is ample (about 44 in. a year), and the prevailing winds help to clean the streets. The westerly winds, however, sometimes bring across the bay the offensive smells of the great abattoirs and meat-curing establishments (saladeros) at the foot of the Cerro. The mean annual temperature is about 62° F. An abundant water supply is brought from the Santa Lucia River, 32 m. distant, with a receiving reservoir at Piedras, 100 ft. above the level of the sea in an area of 312,946. The Montevideo Water Supply and Sewerage Co. has a large and efficient engineering staff, and the city now has a complete system of sewers and water supply. Montevideo itself and the northern suburbs have been improved for years. The Public Works during the last ten years have been 1,360,000,000, and the balance of 1908 was $2,500,000. The city is largely devoted to commercial, shipping and financial interests. The government edifices, large retail shops and most of the fine urban residences are in the ciudad nueva, while most of the urban industries, the railway stations and the dwellings of the poorer classes are in the ciudad novissima. Beyond these is a fringe of suburbs (La Union and Paso Molino), and on the western side of the bay is the struggling suburb of Cerro, largely industrial in character. In 1908 eight tramway lines (all electric but one) extended out to these suburbs, some of the lines extending to the fishing settlements of Puertito, Las Bocas and Pocitos and the Buçeú cemeteries on the eastern coast.

The principal street, which is considered one of the finest boulevards in South America, is the Calle 18 de Julio, extending eastward from the Plaza de la Independencia to the suburb of Cordon; one of its features is its Sunday morning market, occupying the whole street from the Plaza de la Independencia to the Plaza Libertad, a distance of half a mile—a survival of the old market that existed here at the fortified entrance to the walled town in the earlier years of its history. There are seven plazas, or squares, within the urban limits: Zahara or Independencia, Libertad or Cagancha, Treinte y Tres, Flores and Frutos; and two suburban parks or public gardens: the Paseo del Prado and Parque...
Urbano. The Plaza de la Independencia stands at the junction of the old and new towns and is the centre of the city's political and social life. This square is distinguished for a uniform and nearly completed line of colonnades in front of the buildings surrounding it. The Paseo del Prado, which ranks high among the public gardens of South America, is beautifully situated beyond the suburb of Paso Molino, 3 m. from the city. The Paseo was originally the quinta of a German of cultivated tastes named Joseph Buschenthal, who spent a fortune in its adornment. The Parque Urbano, at the Playa Ramírez bathing resort, is a modern creation. The buildings of Montevideo are chiefly of brick and broken stone, covered outside with plant or brick ornament. One to three storeys with flat roofs, usually surmounted by a square tower, or mirador. The roofs, or azoteas, are largely used for domestic purposes, or roof gardens.

The city contains a large number of handsome edifices, both public and private, among which are the Bolsa, Government House, municipal hall, cathedral, Cabildo, Hospital de Caridad, insane asylum, Italian hospital, Teatro Solís, Athenaearum, and the Club Uruguayo. The Bolsa (exchange), custom-house, cathedral, and Cabildo are in the old town; the Bolsa is a copy of the Bordeaux exchange. The cathedral faces on the Plaza de la Independencia, and two sombre trees, mounted on the pavement, and these, with the large dome behind, rise far above the surrounding buildings and make a very conspicuous landmark. The church was consecrated in 1804, and in 1869 was raised to the dignity of a cathedral. Montevideo is now the seat of a small archiepiscopal see with only two suffragan dioceses. Directly across the plaza is the old Cabildo, a plain, heavy-looking two-storied edifice of the colonial period, the seat of municipal administration during Spanish rule, but now occupied by the two chambers of the Uruguayan Congress and by the higher police authorities of the city.

The people of Montevideo maintain more than forty charitable associations, including the Caridad (charity) hospital on Calle 25 de Mayo, and the insane asylum in the suburb of La Unión, both built and largely supported from the proceeds of frequent lottery drawings. They also maintain a beggars' asylum and a foundlings' asylum. The national museum (founded in 1880) and public library (founded 1833) are in one wing of the Solís Theatre. There are a British hospital (founded 1857, the present edifice dating from 1867) chiefly for the use of sailors, an Anglican church in Calle Santa Teresa, dating from 1849, and a handsome Italian hospital of modern construction. The university, in Calle Uruguay, has faculties of law, medicine, letters, mathematics, engineering, and some minor groups of studies, including agriculture and veterinary science. The government maintains two normal schools, a school of arts and trades (artes y oficios), and a military school.

The harbour of Montevideo consists of a shallow bay, circular in shape and about 23 m. from shore to shore, and an outer roadstead exposed to the violent winds of this latitude, where the larger ocean-going steamers were compelled to anchor before the construction of the new port works. In 1890 the Uruguayan government entered into a contract for the dredging of the bay, the construction of two long breakwaters, the dredging of a channel to deep water, and the construction of a great basin and docks in front of the city. Surtaxes were imposed on imports and exports to meet the expenditure, and work was begun in 1901. In 1908 the breakwaters and the greater part of the dredging had been completed, and the entrance channel, with a minimum depth of 24 ft., permitted the admission of large steamers. Another important improvement for the commerce of Montevideo is the cattle export. An English syndicate and work was begun in 1909, is the construction of an embankment and new shore line on the south side of the city, to be finished in five years at a cost of $7,211,116. There are three large dry docks connected with the port, known as the Mauá (275 ft. long, inside) and the Gounouilhou (300 ft.) on the east side of the bay, and Jackson & Cibils (450 ft.) on the west side at the foot of the Cerro. Four railways terminate at Montevideo, one of them (the Central Uruguay) extending to the Brazilian frontier. In 1908 20 lines of ocean-going steamers made regular calls at the port and several lines of river steamers ran to Buenos Aires and the ports of the Paraná, Paraguay, and Uruguay rivers. The exports consist chiefly of livestock, jerked beef, hides, wool, and other animal products, wheat, flour, corn, linseed, barley, hay, tobacco, sealskins, fruit, vegetables, and some minor products. Manufactures exist only to a limited extent and chiefly for domestic consumption.

The suburbs of Montevideo include the fashionable bathing resorts of Playa Ramírez and Pocitos on the coast east of the city, the inland suburbs of Paso Molino and La Unión, and the industrial town of Cerro, across the bay. The Flores Island disseminates station is 12 m. east of the city. The position was formerly on Rat Island (within the bay), which is now used as a public depot for inflammables. The chief point of interest in this suburb is the conical hill known as the Cerro, or "mount," from which the city takes its name, on which stands an old Spanish fort, sometimes Garrisoned and sometimes used for the incarceration of political prisoners. Its elevation is 486 ft. (Reclus), and a lighthouse rises from within the fort carrying a revolving light that can be seen 25 m. at sea.

Montevideo was founded in 1726 through the efforts of Don Martín de Murro, who was governor of Buenos Aires, who wished to check the advance of the Portuguese on this side of the La Plata. A small military post had existed there since 1717, but efforts to create a town had been fruitless until Zapalá offered to make hidalgos of the first settlers and to give them cattle and sheep. The first families to accept this offer came from the Canary Islands in 1726 under the direction of Don Francisco Alzibar; they were followed by others from Andalusia and some of the Spanish-American settlements. Its growth at first was slow, but on the abolition of the Cadiz monopoly in 1778 it became a free port and its trade increased so rapidly that it soon became one of the chief commercial centres of South America. The city was captured in 1807 by a British expedition under Sir Samuel Auchmuty, but was abandoned when the expedition against Buenos Aires under General Whitecote was defeated. In 1808 the governor of Montevideo established an independent junta, but after the Buenos Aires declaration of independence in 1810 the Spanish forces were concentrated in Montevideo and held it until expelled in 1814 by the Argentine land and sea forces under General Alvear and Admiral Brown. The differences following the expulsion of the Spanish and the rivalries of Argentina and Brazil over the possession of Uruguay, then commonly termed the "Banda Oriental," greatly reduced the population of the city and partially destroyed its trade. It was made the capital of the republic in 1828 and had partially recovered its population and trade when the disastrous struggle with Rossas, dictator of Buenos Aires, broke out and the city was subjected to a nine years' siege (1834-52), the investment being conducted by General Obre, and the defence by General Paz. In 1864-1865 Brazil intervened in the affairs of the republic, blockaded the port, and reinstated ex-president Flores. The war with Paraguay that followed, which lasted until 1870, made Montevideo the base of supplies for the Brazilian army and navy and added largely to its trade and wealth. The valuation of the city and suburbs, which was $141,150,000 in 1860, was $748,000,000 in 1872. In addition to the reckless speculation of this period, there were continued political dissensions, repeated dictatorships and financial mismanagement on the part of the government. Not the least of these burdens were the personal and irregular drafts of some of the ex-presidents upon the treasury and revenue officers, particularly the custom-house of this port, upon which the republic depended for the major part of its revenue. The commercial and financial collapse that followed lasted through the greater part of the last three decades of the century; but settled government and improved finances subsequently contributed to a slow but steady recovery in the trade and industrial activities of the city.

**MONTÉ VULUTURE** (anc. Vultur), a mountain of Basilicata, Italy, in the province of Potenza, the summit of which is about
MONTFAUCON—MONTFLEURY

5 m. S. of Meli. It is an extinct volcano rising to 4365 ft. above sea-level, belonging in Roman times to Apulia, and lying on the boundary between it and Lucania. The crater is densely overgrown with oaks and beeches which harbour wild boars and wolves. There are two small lakes on the banks of the upper lake and the Cappoquin monastery of San Michele and the picturesque ruined church of Sant' Ippolito. The city of Rionero in Vulture is pleasantly situated 27 m. by rail N. of Potenza, at the foot of Monte Vulture. Pop. (1901), 11,834. It does not seem to be older than the first half of the 17th century. In 1851 it suffered severely from an earthquake.

See G. de Lorenzo, Venosa et la regione del Vulture (Bergamo, 1906).

MONTFAUCON, BERNARD DE (1655–1741), French scholar and critic, was born in the châtel de Soulage, now Soulage, in the department of Aube, France, on the 13th of January 1655. Belonging to a noble and ancient line, and destined for the army, he passed most of his time in the library of the family castle of Rocquetaillade, devoting books in different languages and on almost every variety of subject. In 1672 he entered the army, and in the two following years served in Germany under Turenne. But ill-health and the death of his parents brought him back to his studious life, and in 1675 he entered the cloister of the Congregation of St Maur at La Daurade, Toulouse, taking the vows there on the 13th of May 1676. He lived successively at various abbeys—Oradour, St Floret, Sarrès,—where he specially studied Greek and examined the numerous MSS. of the convent library, at La Grasse, and at Bordeaux; and in 1687 he was called to Paris, to collaborate in an edition of Athanasius and Chrysostom, contemplated by the Congregation. From 1698 to 1701 he lived in Italy, chiefly in Rome, in order to consult certain manuscripts, those available in Paris being insufficient for the edition of Chrysostom. After a stay of three years he returned to Paris, and retired to the abbey of St Germain-des-Prés, devoting himself to the study of Greek and Latin manuscripts which were then being written and published. He died suddenly on the 21st of December 1741. His first publication, in which he was assisted by Jacques Loppin and Antoine Pouget, was the first volume of a never-completed series of previously unpublished Analecta graeca (1688). In 1690 appeared La Vérité de l'histoire de Judith. Athanasii opera omnia, still the best edition of that Father, was issued with a biography and critical notes in 1698. In connexion with this may be mentioned Collectio nova patrum et scriptorum graecorum (1700), containing some newly discovered works of Athanasius, Eusebius of Caesarea, John Chrysostom, and Topographia christianae of Cosmas Indicopleustes. His copious Diorium italicum (1702) gives an account of the principal libraries of Italy and their contents; this work has been translated into English by J. Henley (1725). The Palaeographia graeca (1708), illustrating the whole history of Greek writing and the variations of the characters, has not yet been superseded; in its own field it is as original as the De re diplomatica of Mabillon. In 1713 Montfaucon edited Hexapolorum origines quoque superst. not superseded till the work of Field (1873); and between 1718 and 1738 he completed his edition of Joannis Chrysostomi opera omnia. His L'Antiquité expliquée et représentée en figures (1719) laid the foundation of archaeological knowledge. It was continued by him in Les Monuments de la monarchie française, 1729–1733. Both these works have been translated into English. Montfaucon's Bibliotheca bibliothecarum manuscriptarum (1759) is a list of the works in MS. in the libraries with which he was acquainted.

A list of his works will be found in Bibliothèque des écrivains de la congrégation de Saint-Maur, by C. de Lame (1882), and in the article in the Nouvelle biographie générale, which gives an account of their scope and character; see also Emmanuel de Bréville, La Société de l'abbaye de St-Germain-des-Prés au 18e siècle; Bernard de Montfaucon and les bernardiens (2 vols., Paris, 1891).

MONTFERRAT, COUNT OF, a title derived from a territory south of the Po and east of Turin, and held by a family who were in the 12th century one of the most considerable in Lombardy.

In 1147 a count of Montferrat took part in the Second Crusade; but the connexion with the Holy Land begins to be intimate in 1176. In that year William Longsword, eldest of the five sons of Count William III., came to the kingdom of Jerusalem, on the invitation of Baldwin IV. and the baronage, and married the heiress of the kingdom, Sibylla. He died within a few months; but his wife bore a posthumous son, who became Baldwin V. Count William III. himself (uncle to Philip of France and brother-in-law to Conrad III.) afterwards came to the Holy Land to watch over the interests of his grandson; and he was among the prisoners taken by Saladin at Hittin in 1187. Shortly after the battle of Hittin there appeared in Palestine the ablest and most famous of the family, Count William's second son, Conrad. Conrad, following the family tradition and invited by the emperor Isaac Angelus, had gone to serve at the court of Constantinople. He soon became a considerable person; married Isaac's sister, and defeated and killed a usurper; but he was repaid by ingratitude and suspicion, and fled from Constantinople to Palestine in 1187. Putting into Tyre he was able to save the city from the deluge of Mahomedan conquest which followed Saladin's victory at Hittin. He established himself firmly in Tyre (refusing admission to Guy, the king of Jerusalem); and from it he both sent appeals for aid to Europe—which largely contributed to cause the Third Crusade—and despatched reinforcements to the crusaders, who, from 1188 onwards, were engaged in the siege of Acre. His elder brother had been the husband of the heiress Sibylla; and on the death of Sibylla, who had carried the crown to Guy de Lusignan by her second marriage, Conrad married her younger sister, Isabella, now the heiress of the kingdom, and claimed the crown (1190). The struggle between Conrad and Guy paralysed the energies of the Christians in 1191. While Richard I. of England espoused the cause of Guy, who came from his own county of Poitou, Philip Augustus espoused that of Conrad. After the departure of Philip, Conrad fomented the discord between Richard and Guy, and in 1194 invaded and defeated Saladin against him. But he was the one man of ability who could hope to rule the débris of the kingdom of Jerusalem with success; he was the master of an Italian statecraft which gave him the advantage over his ingenious rival; and Richard was finally forced to recognize him as king (April 1192). In the very hour of success, however, Conrad was struck down by the emissaries of the Old Man of the Mountain (the chief of the Assassins).

Still another son or Count William III. achieved distinction. The hrabaud of Montferrat, the younger brother of Conrad, who was chosen leader of the Fourth Crusade in 1201, on the death of Theobald of Champagne. In the winter of 1202–1203 he went to Germany to visit Philip of Swabia; and there it has been suggested, he arranged the diversion of the Fourth Crusade to Constantinople (see Crusades). Yet in the course of the crusade he showed himself not unsubmissive to Innocent III., who was entirely opposed to such a diversion. After the capture of Zara, however, he joined the crusaders, and played a great part in all the events which followed till the capture of Constantinople by the Latin in 1204. But Baldwin of Flanders was elected emperor over his head; and his irritation was not wholly allayed by the grant of Macedonia, the north of Thessaly, and Crete (which he afterwards sold to Venice). In 1207 he died, killed in battle with the Bulgarians. He left a son Demetrius, who assumed the title of king of Thessalonica, which the father had never borne (cf. Luchaire, Innocent III.: La question d'Orient, p. 190). In 1222 Demetrius lost his kingdom to Theodore Angelus, and the house of Montferrat its connexion with the East.

See Savio, Studi storici sul marchesato degli Uberti di Montferrato (Turin, 1888); Ilsen, Markgraf Konrad von Montferrat (1886); and also the works of Cerrato (Turin, 1884) and Desimoni (Genoa, 1880).

MONTFLEURY (d. 1667), French actor, whose real name was Zacharie Jacob, was born in Anjou during the last years of the 16th century. He was enrolled as one of the pages to the duc de Guise, but he ran away to join some strolling players,
Montfort—Montfort, Simon de

assuming the name of Montfleury. About 1635 he was a valued member of the company at the Hôtel de Bourgogne, and he was in the original cast of the Cid (1636) and of Horace (1640).

Richelieu thought highly of him, and when in 1638 Montfort married the actress Jeanne de la Chalpe (d. 1683), the cardinal Desfaints made the contract. Montfleury married his second wife at Ruell. Montfleury died in Paris from the rupture of a blood-vessel, while playing the part of Orestes in Andromaque, in December 1667. He was the author of a tragedy, La Mort d'Asdrubal, performed in 1647.

Montfort, the name of a famous French family long seated at Montfort l'Amaury, near Paris, descended from a certain William, a descendant of the counts of Flanders, who flourished during the latter part of the 10th century, and who built a castle at Montfort l'Amaury. Until 1209, when Simon IV. took the title of count, William and his successors were known as barons de Montfort. This Simon IV. de Montfort (c. 1160–1218), a son of Simon III. (d. 1181), is chiefly known for the very active part which he took in the crusade against the Albigensians. Twice he went to Palestine as a crusader, and in 1209, answering the call of Pope Innocent III., he joined the host which marched against the enemies of the Church in Languedoc. He became vicomte of Béziers and of Carcassonne, and was soon the leader of the crusaders. He took place after place, defeated Raymond VI., count of Toulouse, at Castelnaudary, and about a year later (September 1213) he joined Raymond's ally, Peter II., king of Aragon, under the walls of Muret. Simon then turned his attention to administering and organizing Languedoc. After a lively discussion in the Lateran Council of 1215, the pope, somewhat reluctantly, confirmed him in the possession of the greater part of the lands of the count of Toulouse, and after two more years of warfare he was killed whilst besieging the city of Toulouse on the 23rd of June 1218. The count's eldest son, Amaury de Montfort (1192–1241), was unable to hold his own, although Philip Augustus sent some troops to his assistance. In 1218 Simon's brothers, Simon, viscount of Toulouse, and Raymond's ally, Peter II., king of Aragon, divided the count's inheritance. Simon then took the cross and went on crusade to the Holy Land, dying soon afterwards at Otranto. In 1230 Amaury was made constable of France. Simon IV. had a brother, Guy de Montfort (d. 1228), who shared his military exploits both in Asia and in Europe, and who was afterwards employed by Louis VIII. to negotiate with the pope at Rome. He was killed before Vareilles on the 31st of January 1228. In 1243 Yolande (d. 1282), the heiress of the Montforts, married Arthur II., duke of Brittany, and the county of Montfort became part of this duchy. In 1251 Simon, duke of Brittany, claimed Brittany in opposition to Charles, count of Blois, and at length secured the duchy. Except for one interval his descendants held it until it was united with the French crown at the end of the 15th century.

See A. Molineur, Catalogue des actes de Simon et d'Amaury de Montfort (1873); and C. Donais, La Soumission de la vicomté de Carcassonne par Simon de Montfort et la croisade contre Raymond VI. (1882).

Montfort, Simon de, Earl of Leicester (d. 1265), English statesman and soldier, was born in France about the year 1200, the fourth son of Simon IV. de Montfort (see above), the leader of the Albigensian crusade, by Alicia de Montmorenci. Simon IV., whose mother was an heiress of the Beaumont family, claimed in her right, and received from King John, the earldom of Leicester (1207), only to lose it again through espousing the French side in the wars between that sovereign and Philip Augustus. The young Simon, of whose youth and education nothing is recorded, came to England in 1230 and attached himself to Henry III., obtaining with the consent of his sole surviving brother Amaury a re-grant of the family earldom. Simon was closely associated with the English and closely attached to the royal party. He gave, however, an early proof of religious fervour, and of an unbending harshness, by the expulsion of all the Jews who had settled in his borough of Leicester to practise usury. In 1238 he obtained the hand of the king's sister Eleanor, the widow

of the younger William Marshal. The king approved of the match, but it was resented by his brother Richard of Cornwall and the baronage, and objections were raised on the ground that Eleanor had previously taken vows of chastity. With some difficulty Earl Richard was pacified, and Montfort then proceeded toางول الدين على البارونية. He was made general of the mainstay of the personal visit to Rome. In 1239, however, the influence of detractors and a quarrel over some obscure financial transactions in which he appears to have used Henry's name without a formal warrant led to a breach between himself and the king. The earl and his wife went for a time to France; and, though a nominal reconciliation with the king was soon effected, both departed on crusade with Richard of Cornwall in 1240. Eleanor was left behind in Apulia while her husband proceeded to the Holy Land. He acquitted himself with distinction, and there was some thought among the Frankish barons of appointing him to act as regent of the Latin kingdom of Jerusalem. But he returned in 1241, took part in Henry's disastrous French expedition of 1242, and was readmitted to full favour.

Between 1243 and 1248 he received many gifts from the king; he stood forward in parliament as a mediator between the court party and the opposition; it is only from the correspondence of his friends Grosseteste and Adam de Marsh that we learn of his dissatisfaction with the condition of church and state. He was keenly interested in Grosseteste's proposals for ecclesiastical reform, and was considered the mainstay of the reforming party. In 1248 he again took the cross, with the idea of following Louis IX. to Egypt. But, at the repeated requests of the king and council, he gave up this project in order to act as governor in the unsettled and disaffected duchy of Gascony. Bitter complaints were excited by the rigour with which the earl suppressed the excesses of the seigneurs and of contending factions in the great communities. Henry yielded to the outcry and instituted a formal inquiry into the earl's administration. Montfort was formally acquitted on the charges of oppression, but his unpopularity was increased by the fact that his family and adherents were being held in distress to France (1252). The nobles of France offered the earl the regency of the kingdom, vacant by the death of the Queen-mother Blanche de Castile, but he preferred to make his peace with Henry (1253), in obedience to the exhortations of the dying Grosseteste. He helped the king in dealing with the disaffection of Gascony; but their reconciliation was a hollow one, and in the parliament of 1254 the earl led the opposition in resisting a demand for a subsidy. In 1256 and 1257, when the discontent of all classes was coming to a head, Montfort nominally adhered to the royal cause, but he undertook, with Peter de Savoy, the queen's uncle, the difficult task of extricating the king from the plagues which he had given to the pope with reference to the crown of Sicily; and Henry's writs of this date mention the earl in friendly terms. But at the "Mad Parliament" of Oxford (1258) Montfort appeared side by side with the earl of Gloucester at the head of the opposition. It is said that Montfort was reluctant to approve the oligarchical constitution created by the Provisions of Oxford, but his name appears in the list of the Fifteen who were to constitute the supreme board of control over the administration. There is better ground for believing that he disliked the narrow class-spirit in which the victorious barons used their victory; and that he would gladly have made a compromise with the moderate royalists whose policy was guided by the Lord Edward, Henry's eldest son. But the king's success in dividing the barons and in fostering a reaction rendered such projects hopeless. In 1261 Henry revoked his assent to the Provisions, and Montfort left the country in despair.

He returned in 1263, at the invitation of the barons, who were now convinced of the king's hostility to all reform and raised a rebellion with the avowed object of restoring the form of government which the Provisions had ordained. For a few weeks it seemed as though the royalists were at his mercy; but he made the mistake of accepting Henry's offer to abide by the arbitration of Louis IX. of France. At Amiens, in January 1264, the French king decided that the Provisions were unlawful and
invalid. Montfort, who had remained in England to prepare for the worst, at once resumed the war, and thus exposed himself to accusations of perjury, from which he can only be defended on the hypothesis that he had been led to hope for a genuine compromise. Though merely supported by the towns and a few of the younger barons, he triumphed by superior generalship at Lewes (May 14, 1264), where the Earl of Oxford and Richard de Cornwall fell into his hands. Montfort used his victory to set up the government by which his reputation as a statesman stands or falls. The weak point in his scheme was the establishment of a triumvirate (consisting of himself, the young earl of Gloucester, and the bishop of Chichester) in which his colleagues were obviously figuringheads. This flaw, however, is mitigated by a scheme, which he simultaneously promulgated, for establishing a thorough parliamentary control over the executive, not excepting the triumvirs. The parliament which he summoned in 1265 was, in truth, a packed assembly; but it can hardly be supposed that the representation which he granted to the towns (see Parliament and Representation) was intended to be a temporary expedient. The reaction against his government was baronial rather than popular; and the Welsh Marchers particularly resented Montfort’s alliance with Llewellyn of North Wales. Little consideration for English interests is shown in the treaty of Pipton which sealed that alliance (June 22, 1265). It was by the forces of the Marchers and the strategy of Edward that Montfort was defeated at Evesham (Aug. 4). Divided from the main body of his army, which was on the north-east, the earl was out-numbered and surrounded before reinforcements could reach him. For years after his death he was reviled by the commons as a martyr, and the government had no little difficulty in reducing the remnants of his baronial supporters. His character has suffered in the past from indiscriminate eulogy as much as from detractors. He was undoubtedly harsh, masterful, impatient and ambitious. But no mere adventurer could have won the friendship of such men as Marsh and Grosseteste; their verdict of approval may be the more unhesitatingly admitted since it is not untempered with criticism.

The original authorities are those for the reign of Henry III. The best biographies are those by R. Pauli (trans. C. M. Goodwin, London, 1876); G. G. Prothero (London, 1877); C. Bémont (Paris, 1884). See also the letters of Adam de Marsh in J. S. Brewer’s Monumenta Franciscana, vol. i (Rolls series, 1888); H. R. Luard, Epistolae Roberti Grosseteste (Rolls, series, 1861); F. S. Stevenson, Robert Grosseteste (London, 1899); W. H. Blauw, The Barons’ War (Cambridge, 1876); (H. W. C. D. van der Waals, MONTGAILLARD, JEAN GABRIEL MAURICE ROQUES, Count (1765–1843). French political agent, was born at Montgelas, where his father was a mayor of the French administrative district. He was born on November 21, 1765. His parents belonged to the minor nobility, and he was educated at the military school of Soissons, where he attracted the notice of the comte of Provence (afterwards Louis XVIII). After serving for some years in the West Indies his father’s own ship. In 1789 he was established in Paris as a specific diplomatic agent, and though he emigrated to England after the 10th of August 1792, he returned six weeks later to Paris, where his security was most probably purchased by services to the revolutionary government. He was a member of the revolutionary government, and his name was attached to the Executive Committee of 1792. He went to Vienna in 1793 and saw Pitt in London, where he published his État de la France au mois de mai 1794, predicting the fall of Robespierre. He was employed by Louis XVIII. to supervise Austrian intervention on behalf of Marie Thérèse (afterwards duchess of Angoulême), still a prisoner in the Temple, and he drew up the proposition made by the prince to Charles Pichegru, the details of which appear in his Mémoire sur la trahison de Pichegru (Monteure, April 18, 1804). In June 1796 he made a journey to Italy in the hope of opening direct relations with Bonaparte. On his return to the suburbs of Blankenburg he was regarded with suspicion, and he departed for Paris to await events. He is thought to have indicated the possession of the count de Antragues, agent of the princes, of documents compromising Pichegru. In April 1798 he surrendered to Claude Roberjot, the Hamburg minister of the Directory, further papers relating to the matter. He followed Roberjot to Holland, and there wrote a memorandum to prove that the only hope for France lay in the immediate return of Bonaparte from Egypt, followed by assumption of the supreme power. This was noted by Alexandre de Humboldt and Constantine. When he ventured to return to Paris in the hope of recognition from the First Consul he was imprisoned, and on his release he was kept under police supervision. Napoleon, who appreciated his real insight into European politics and his extraordinary knowledge of European courts, attached him to his secret cabinet in spite of his intriguing and mendacious character. He received a salary of 14,000 francs, reduced later to 6000, for reports on political questions for Napoleon’s use, and for pamphlets written to help the imperial policy. He tried to wrestle Napoleon from the Austrian mediation, the Russian campaign, and counselled the limitation of the empire within the Rhine, the Alps and the Pyrenees. The Bourbon restoration made no change in his position; he was maintained as confidential adviser on foreign and home politics, and gave shrewd advice to the new government. His career ended with the old monarchy, and he died in obscurity at Chavillon on the 8th of February 1841.

His Souvenirs, which must be read with the utmost caution, were edited by Clément de La Rochefoucauld (1805; his Mémoires diplomatiques (1805–1819) were published by the same editor in 1838). His Histoire de la France (Paris, 1826) was translated into English by Edmund Burke. His other writings include: L’Angleterre en 1812 (Paris, 1811); De la restauration de la monarchie des Bourbons et du retour à l’ordre (Paris, 1814); and Histoire de France depuis 1825 jusqu’à 1830 (Paris, 1835).

MONTGELAS, MAXIMILIAN JOSEF GARNERIN, Count (1759–1838), Bavarian statesman, came of a noble family in Savoy. His father John Sigmund Garnerin, Baron Montgelas, served the military service of Maximilian Joseph III., Elector of Bavaria, and married the countess Ursula von Trapp. Maximilian Joseph, their eldest son, was born on the 11th of September 1759. He was educated successively at Nancy, Strassburg and Ingolstadt. Being a Savoyard on his father’s side, he naturally felt the French influence, which was then strong in Germany, with peculiar force. To the end of his life he spoke and wrote French more correctly and with more ease than German. In 1779 he entered the public service in the department of the censorship of books. The elector Charles Theodore, who had at first favoured him, became offended on discovering that the Illuminati, of which he was a member, was attached to the anti-clerical movement called the Aufklärung. Montgelas therefore went to Zweibrücken, where he was helped by his brother Illuminati to find employment at the court of the duke, the head of a branch of the Wittelsbach family. From this refuge also he was driven by orthodox enemies of the Illuminati. The brother of the duke of Zweibrücken—Maximilian Joseph—took him into his service as private secretary. When his employer succeeded to the duchy Montgelas was named minister, and in that capacity he attended the conference of Rastadt and Reichenau, where he made proposals for the reorganisation of Germany, which was the consequence of the French Revolution, was in full swing. In 1799 the duke of Zweibrücken succeeded to the electorate of Bavaria, and he kept Montgelas as his most trusted adviser. Montgelas was the inspiration and director of the policy by which the electorate of Bavaria was turned into a kingdom, and was very much increased in size by the annexation of church lands, free towns and small lordships. As this end was achieved by undeviating servility to Napoleon, and the most cynical disregard of the rights of Bavaria’s German neighbours, Montgelas became the type of an unprincipled politician in the eyes of all Germans who revolted against the supremacy of France. From his own conduct and his written defence of his policy it is clear that such sentiments as theirs appeared to be merely childish to Montgelas. He was a thorough politician of
18th-century type, who saw and attempted to see nothing except that Bavaria had always been threatened by the house of Habsburg, had been supported by Prussia for purely selfish reasons, and could look for useful support against these two only from France, who had selfish reasons of her own for wishing to counterbalance the power both of Austria and Prussia in Germany. As late as 1814, when Napoleon's power was visibly breaking down, and Montgelas knew the internal weakness of his empire well from visits to Paris, he still continued to maintain that France was necessary to Bavaria. The decision of the king to turn against Napoleon in 1814 was taken under the influence of his son and Marshal Wedel rather than of Montgelas, though the minister would not have been influenced by any feeling of sentimentality to adhere to an ally who had ceased to be useful. In internal affairs Montgelas carried out a policy of secularization and of administrative centralization often by brutal means, which showed that he had never wholly renounced his opinions of the time of the Enlightenment movement. His enemies persuaded the king to dismiss him in 1817, and he spent the remainder of his life in retirement till his death in 1826. He had married the countess von Aro in 1803, and had eight children, of whom eight were sons.

See Denkwürdigkeiten des bayer. Staatsministers Maximilian Graf von Montgelas, a German version of the French original, ed. by Ludwig Graf v. Montgelas (Stuttgart, 1887); Briefe des Staatsministers Graf von Montgelas, ed. by Julie von Zetzog (Regensburg, 1853); Dumoulin Eckart, Bayern unter dem Ministerium Montgelas (Munich, 1894).

MONT GENÈVRE, a very easy and remarkable pass (6083 ft.) between France and Italy, which is now considered by high authorities to have been crossed by Hannibal, as it certainly was by Julius Caesar, Charles VIII., and in the war of 1559. An excellent carriage-road mounts in 7 m. from Briançon, at the very head of the Durance valley, to the pass. On the French side of the divide is the village of Bourg Mont Genèvre, and on the Italian side that of Clavières, both inhabited all the year round, as the pass runs east and west, and is thus sheltered from the north wind. A descent of 5 m. leads down to Césanne in the Doria Riparia valley, which is followed for 5 m. more to Oulx (17 m. from Briançon), on the Mont Cenis railway.

MONTGOMERIE, ALEXANDER (c. 1550–c. 1610), Scottish poet, was the second son of Hugh Montgomerie of Hesillhead, Ayrshire, and was born about the middle of the 16th century. He spent some part of his youth in Argyshire and afterwards lived for a time at Compton Castle, in Galloway. He was in the army of the regent Morton; thereafter, on the regent's demission of office in 1578, in that of the king, James VI. In 1583 the grant by the Crown of a pension of 500 marks was confirmed; and three years later he set out on a tour through France, Flanders and other countries. He appears to have got into trouble, to have been imprisoned abroad, and to have lost favour at the Scottish court, and (for a time) his pension. We have no record of his closing years.

Montgomerie's chief poem is the Cherry and the Sloe, first printed in 1597 (two impressions). It was frequently reprinted in the following centuries, and was seconded twice in Latin verse in 1631, in Dempster's Cerasum et syblestrum prunum, opus poematicum. It is included in the collected edition of Montgomerie's Poems, by David Irving (1821), and by James Cranston, for the Scottish Text Society (1887). The text in the latter is a composite of 930 lines from the second impression of 1597 (n.s.) and 666 lines from the version in Allan Ramsay's (18th) Ever Green (1724); but a better text, from a MS. in the Laing collection in the university of Edinburgh, has been prepared (1907) for the Scottish Text Society by Mr George Stevenson. The poem, written in the complicated alliterative fourteen-line stanza, is a confused allegory—the confusion being due to the fact that sections of the poem were written at different times—on Youth's choice between a richly laden cherry-tree on a high crag and a sloc "bus[h]" at his feet. His other poems are: The Flying betwixt Montgomery and Polwarth (1629; 1st ed., 1621), which reproduces the literary habit of the Flying of Dunbar and Kennedie; a series of 70 sonnets; a large number of miscellaneous poems, amatory and devotional; and The Minnes Melodie, Containing certayne Psalms of the Kingly Prophete Davoyd, applid to a new pleasant tune (Edinburgh, 1605). The formal value of Montgomerie's verse was fittingly acknowledged by James VI. in his early critical essay An eyme of Scotlandes good poemes, which contains a short and careful detailed account of the obserвит and corkesvit in Scotch Poesie, where the author makes three quotations from Montgomerie's poems, then in circulation in manuscript. Montgomerie had written a sonnet to his majesty, which is prefixed to the Essays of a Prentise.

Montgomerie stands apart from the courtier-poets Ayton, Sterling, and others, who write in the literary English of the South. He carries on the Middle Scots tradition, and was not without influence in the vernacular revival, in Allan Ramsay and his successors.

MONTGOMERY, GABRIEL, SEIGNEUR DE LORGES, COMTE DE (c. 1550–1574), French soldier, became a lieutenant in the king of France's Scottish guards, of which his father was captain, and engaged in police operations against the Protestants. Having inadvertently caused the death of King Henry II. in a tournament (June 30, 1559) he was disgraced and retired to his estates in Normandy. He studied theological questions and espoused the cause of the Reformers. In 1562 he allied himself with the prince of Condé, took Bourges, and defended Rouen from September to October 1562 against the royal army. In the third War of Religion he occupied Béarn and Bigorre (1566). Escaping from the massacre of St Bartholomew, he went to England and returned with a fleet for the relief of La Rochelle (1573), but soon had to withdraw to Cornwall. Returning to Normandy in 1574, he defended Domfront, which was being besieged by Marshal de Maillé, but was forced to capitulate on the 25th of May. He was sentenced to death by the parliament, and beheaded in Paris on the 26th of June 1574.

See L. Marlet, Le Comte de Montgomery (Paris, 1890).

MONTGOMERY, JAMES (1771–1854), British poet and journalist, son of a Moravian minister, was born on the 4th of November 1771, at Irvine in Ayrshire, Scotland. Part of his boyhood was spent in Ireland, but he received his education at Yorkshire, at the Moravian school of Fulneck near Leeds. He edited the Sheffield Iris for more than thirty years. When he began his career the position of a journalist who held pronounced views on reform was a difficult one, and he twice suffered imprisonment (in 1795 and 1796). His Wanderer of Switzerland (1866), describing the French occupation, attracted considerable attention. The author was described by Lord Byron in a footnote to English Bards and Scotch Reviewers, as "a man of considerable genius," whose Wanderer of Switzerland was worth a thousand "lyrical Ballads." The book had been mercilessly ridiculed by Jeffrey in the Edinburgh Review (1807), but in spite of this Montgomery achieved a wide popularity with his later volumes of verse: The West Indies (1810); The World Before the Flood (1812); Greenland (1819); Songs of Zion (1822); The Pelican Island (1826). On account of the religious character of his poetry, he is sometimes confounded with Robert Montgomery, very much to the injustice of his reputation. His verses were dictated by the inspiring force of humanitarian sentiment, and he was especially eloquent in his denunciation of the slave trade. The influence of Campbell is apparent in his earlier poems, but in the Pelican Island, his last and best work as a poet, he evidently took Shelley as his model. His reputation now rests chiefly on his hymns, about a hundred of which are still in current use, and he twice suffered imprisonment in 1795 and 1796. His Wanderer of Switzerland (1866), describing the French occupation, attracted considerable attention. The author was described by Lord Byron in a footnote to English Bards and Scotch Reviewers, as "a man of considerable genius," whose Wanderer of Switzerland was worth a thousand "lyrical Ballads."
MONTGOMERY, R.—MONTGOMERY

£150 was bestowed on him by Sir Robert Peel in 1835. He died at Sheffield on the 30th of April 1854.

His poems were collected and edited by himself in 1841. The voluminous Memoirs, published in seven volumes (1856-1858) by John Hurd and James Hare, contain valuable information on English politics.

MONTGOMERY, RICHARD (1736–1775), American soldier, was born in Co. Dublin, Ireland, in 1736. Educated at St Andrew's and at Trinity College, Dublin, he entered the British army in 1756, becoming captain six years later. He saw service at Louisbourg in 1757 and in the Lake Champlain expedition of 1759, and as adjutant of his regiment (the 17th foot) he shared in the final threefold advance upon Montreal. Later he was present at Martinique and Havana. In 1772 he commanded the army, settled in New York, and married a daughter of Robert R. Livingston. Three years later he was a delegate to the first provincial congress of New York, and became brigadier-general in the Continental army. He was sent with Schuyler on the Canadian expedition, and, on Schuyler's falling ill, the command devolved upon him. Hampered by the indolence of the season and the gross indifference of the troops, he went forward, gaining a few minor successes and capturing the colours of the 7th (Royal) Fusiliers, and met Benedict Arnold's contingent at Point aux Trembles. The pursuit to Quebec barely did not prove strong, but an assault was made on the 31st of December 1775, and almost at the first discharge Montgomery was killed. The body of the American general was honourably interred by the Quebec garrison. Congress caused a memorial to be erected at St Paul's church, New York, and in 1813 his remains were conveyed thither from Quebec.

MONTGOMERY, ROBERT (1807-1855), English poet, natural son of Robert Gomer, was born at Bath in 1807. He was educated at a private school in Bath, and founded an unsuccessful weekly paper in that city. In 1828 he published The Omniscience of the Deity, a work which has its popular religious sentiment so exactly that it ran through eight editions in as many months. In 1830 followed The Pfaffid (a satire), and Satan. An exhaustive review in Blackwood by John Wilson, followed in the thirty-first number of a burlesque of Satan, and two articles in the first volume of Fraser, ridiculed Montgomery's pretensions and the excesses of his admirers. But his name was immortalized by Macaulay's famous onslaught in the Edinburgh Review for April 1830. As a poet, he deserved every word of Macaulay's severe censure, though the brutality of the attack cannot be defended. This exposure did not, however, diminish the sale of his poems. The Omniscience of the Deity reached its 28th edition in 1858. In 1835 Montgomery entered Lincoln College, Oxford, graduating B.A. in 1833 and M.A. in 1838. Taking holy orders in 1835 he obtained a curacy at Whittington, Shropshire, which he exchanged in 1836 for the charge of the church of St Jude, Glasgow. In 1843 he removed to the parish of St Pancras, London, when he was minister of Percy Chapel. He died at Brighton in 1855. He also wrote The Messiah (1832), Woman, the Angel of Life (1833), Oxford (1831), and many devotional and theological works.

MONTGOMERY, a city of Alabama, U.S.A., the capital of the state and the county-seat of Montgomery county, situated (about 162 ft. above the sea) S.E. of the centre of the state, on the left bank of the Alabama river, which is here navigable. Pop. (1900), 30,346, of whom 17,229 were of negro descent and 666 were foreign-born; (1910, census), 38,136. Montgomery is served by the Louisville & Nashville, the Mobile & Ohio, the Atlantic Coast Line, the Seaboard Air Line, the Central of Georgia, and the Queensland. The Alabama, the Mobile & Ohio, and the Alabama & Tennessee form the principal lines. Other lines which have a joint influence upon the city are the Mobile & Ohio, the Columbus & Memphis, and the Missouri Pacific. The principal buildings are the state capitol, near which is a Confederate soldiers' monument (erected by the women of Alabama), the county court-house, the Federal building, the Carnegie library, the masonic temple and the First National Bank and Bell buildings. The public institutions include the city infirmary and St Margaret's hospital, the latter under the direction of the Sisters of Charity. The city has about 100 acres of parks, Oak Park being the most important. Situated in the "Cotton Belt" of Alabama, Montgomery handles 160,000–200,000 bales annually. Truck-gardening is an important industry. The Alabama state fair is held here annually. Among the manufactures are fertilizers, machine-shop products, cotton goods, lumber products, cigars, harness, beer, stone ware, and bricks. The value of the factory products in 1905 was $3,877,653 (an increase of 31.7% over that in 1900). The leading newspapers are the Montgomery Advertiser (morning) and the Montgomery Journal (evening).

The site of Montgomery was once occupied by an Indian village known as Ecunchaty. The first permanent white settlement was made in 1814 by Arthur Moore. In 1837 Samuel Houston, the president of the Republic of Texas, founded the town of Montgomery, which was incorporated as the county seat in 1837. The place soon became the commercial emporium of the Alabama "Cotton Belt." In 1847 it became the capital of the state instead of Tuscaloosa. On the 7th of January 1861, the State Convention through which Alabama seceded from the Union met in the hall of the old county court-house, a building erected on the 4th of February, and organized the Confederate States of America. Montgomery was the capital of the new government (hence the popular name "Cradle of the Confederacy") until May 1861, when that honour was transferred to Richmond, Virginia. It was the seat of Confederate military factories, and on the 12th of April 1865 it was captured by Federal troops. Montgomery received a new city charter in 1905.

MONTGOMERY, a town and district of British India, in the Lahore division of the Punjab. The town has a station on the North-Western railway about half-way between Lahore and Multan. Pop. (1901), 6602. It was founded in 1864 on the opening of the railway, and called after Sir Robert Montgomery, then lieutenant-governor. It is situated in a desolate upland, and though not unhealthy is singularly comfortless.

The District of Montgomery lies in the Bari Doab, or tract between the Sutlej and the Ravi, extending also across the latter river. Area, 4771 sq. m. In the former tract a fringe of cultivated lowland skirts the bank of either river, but the whole interior upland consists of a desert plateau partially covered with bushy and with large patches of impenetrable jungle. On the farther side of the Ravi, again, the country at once assumes the same desert aspect. The population in 1901 was 643,586, showing an apparent decrease of 9.4% in the decade due to emigration to the Chenab Colony. The principal crops are wheat, pulse, cotton and fodder. Camels are bred for export. The leading manufactures are of cotton and silk, and lacquered woodwork, and there are factories for ginning and pressing cotton. The district is traversed by the main line of the North-Western railway, from Lahore to Multan, and is irrigated by the Upper Sutlej inundation canal system, and also from the Ravi.

From time immemorial the Rechna Doab has formed the home of a wild race of pastoral Jats, who have constantly maintained a sturdy independence against the successive rulers of northern India. The sites of Kot Kamila and Harappa contain large mounds of antique bricks and other ruins, while many other remains of ancient cities or villages lie scattered along the river bank, or dot the now barren stretches of the central waste. The pastoral tribes of this barren expanse do not appear to have paid more than a nominal allegiance to the Moslem monitors in later days, when the Sultans extended the Sikh supremacy as far as Mülțan, the population for the most part remained in a chronic state of rebellion. British influence was first exercised in the district in 1847, when an officer was deputed to effect a summary settlement of the land revenue. Direct British rule was effected on the annexation of the Punjab in 1849. There was a general rising of the wild clans during the Mutiny of 1857, several actions being fought before order was restored.
MONTGOMERY—MONTH

MONTGOMERY (Tre' Faldywn), a municipal and parliamentary borough, market town, and the county town of Montgomeryshire, Wales, situated on a wooded hill near the east bank of the Severn, 7 m. S. of Welshpool (Cambrian railway). Pop. (1901), 1934. The principal feature of the town is the ruined castle. Not far off are the traces of an extensive British fort, and, about a mile east, the line of Offa's Dyke, forming the Shropshire boundary. The borough was incorporated by Henry III., when the castle was enlarged, and was the scene of frequent contests between that king and Llewelyn the Great. In the 14th century the castle was held by the Mortimers, from whom it fell to the Yorks. The Crown gave it, in the 15th century, to the Herbert of Chepstow, one of whom, in 1444, surrendered it to the Parliamentarians, who dismantled it.

MONTGOMERYSHERE (Welsh Swydd Tre' Faldywn, Baldwin's town shire), a county of Wales, bounded N. by Denbigh, N.E. and E. by Shropshire, S. by Radnor and Cardigan, W. and N.W. by Merioneth. Its length from S.E. to N.W. is about 30 m.; N.E. to S.W. it measures about 35 m. The surface is broken, though the highest hills are only round the county borders—to the north Berwyn (stretching into Denbighshire); to the west are the Llanfyllin (q.v.); east, the Berriedds; south, the Kerry hills. The principal rivers of the Severn, flowing east and north; the Wye, farther south; the Dyfi, Vyrnwy (Fyrnwy), Clywedog, Tanat and Rhiw. Except the Wye and Dyfi, the principal streams are tributaries of the Severn. Lake Vyrnwy, formed in 1888, is the chief water-supply of Liverpool. The Montgomeryshire canal, some 24 m. long, is connected with the Shropshire Union and Ellesmere canals. The county was formerly a recognized source of oak timber for the navy.

Geologically, the county is occupied almost exclusively by Ordovician and Silurian rocks. The latter, mainly Westock beds bordered by a fringe of Llandover rocks, lie in the form of a complex syncline down the centre of the county from a few miles north of Llanfyllin through Llangadfaen, Llandyfriog, Welshpool, Montgomery, and Newtown. The boundary is very irregular. Between Newtown and Kerry hill Ludlow beds come in, and on the edge of the forest of Clun the Old Red Sandstone just crosses the boundary into this county. North and south of the Silurian tracts the Ordovician rocks occupy the remaining area; they contain bands of andesite and liole in the Berwyn hills, also east of Criggion and south-west of Corndon. In the last-named hill there is a large laccolith mass of dolerite and a similar rock occurs at Criggion. At Machynlleth slate is worked in the Ordovician, and numerous metalliciferous mines exist in the neighbourhood of Newtown from which lead, silver, and copper are obtained. Glacial deposits are prevalent over much of the county.

The climate is mild, and the soil generally fertile, especially in the Severn valley, though towards Merionethshire there are heath and moss. Small holdings (under about 50 acres) tend to diminish The hardy, small, mountain pony is still to be found here. Hunters and cart-horses are bred. Sheep-breeding is practised, and Shropshire downs are superseding the little duna. Of the relatively few green crops potatoes are the most important; oats are the principal grain. Permanent pasture covers a large area. Hill pasture is also extensive. Woolen cloth and flannel manufacture have revived considerably.

The Cambrian railway, entering Montgomeryshire in the north-east, by Llanymynech, crosses it to the south-west with branches to Llanfyllin, Westbury and Van. There is also a branch from Caerwys to Glandyfi (Glandovey) junction, with the coastwise branch of the same company.

The area of the ancient and administrative counties is 516,111 acres, or 797 sq. m., with a population of 54,905 in 1901. Many of the people keep cattle, sheep, and pigs, and Welsh is everywhere the favourite language. The county returns one member to parliament, and includes the Montgomery district of parliamentary boroughs: Llanfyllin (pop. 1632), Llandidoes (2770), Montgomery (1034), Machynlleth, Newtown and Welshpool (6212). The first three and last of these are municipal boroughs. The urban districts are: Newtown and Llanlwhaision (6500), and Machynlleth (2053). The county is in the North Wales and Chester circuit, assizes being held alternately at Newtown and Welshpool.

Welshpool borough has a separate commission of peace, but no separate court of quarter sessions. The ancient county (in Bangor, Hereford, and St. Asaph dioceses) has 59 ecclesiastical parishes or districts, with parts of 11 others.

History and Antiquities.—The Welsh name of Baldwin's town shire is taken from a Norman who did homage to William the Conqueror for this division of Wales. The English name is from Roger de Montgomery, earl of Shrewsbury (temp. William Rufus). At the coming of the Romans this county was part of the Ordovices' territory (Britannia secunda), and there are remains of Roman encampments and fortifications at Caerwys, Mathrafla, and near Montgomery. The roads connecting these stations with those of the south-west and of the north often are visible near Welshpool. Machynlleth was perhaps the Roman Maglona. Remains of old British camps are to be seen at Dolaredyn, on Breidden hill, and at Caerleinon. There are many carins and barrows. Crossing the county was the Via Devana, joined by other roads. From the Roman evacuation under Flavius Honorius (d. A.D. 423) little is known of Montgomery until Wales was subdivided into three districts at the death of Rhodri Fawr, when Montgomery was included in Powys (Powys Gwynaunwyne, Upper Powys). Powys Castle in Montgomery was built for Rhys ab Owain in 1087. After the latter's death it was built Baldwin's Castle, taken later by the Welsh and retaken by Roger de Montgomery. In 1345 Roger Mortimer held it. At Carno, 11 m. from Newtown and from Machynlleth, a battle decisive of North Wales sovereignty was fought in 946, and in 1081 the right heir, Gruffydd ab Cynan, together with Rhys ab Tudur, prince of South Wales, here killed in battle Trahaern ab Caradoc, the usurper, and most of his men. At Machynlleth is seen Owen Glendower's senate house (1402) where he was received prince of Wales.

MONTH (a common Teutonic word, cf. Ger. Monat, D. maand, Dan. maaned, &c., and cognate with Lat. mensis, Gr. μην, &c., in other branches of the Indo-Germanic family; all ultimately from the root seen in the word for the moon in nearly all those languages), originally the period between two returns of the new moon; generally called a lunar and sometimes a synodic or illuminative month. The anomalistic month is the mean time taken by the moon in passing from one perigee to the next; the sidereal month is the mean time in which the moon makes a circuit around the stars; the tropical month is the mean time in which the moon traverses an angle of 360° on the equator; the anomalistic or draconic month is the mean time taken by the moon in passing from one rising node to the next; the solar month is one-twelfth of a tropical year. The lengths of the various months are: synodic = 29.5305 days; anomalistic = 27.5546, sidereal = 27.32166, tropical = 27.32156, nautical = 27.32122, solar = 30.43685. (For the calendar months see Calendar.)

In law a month may mean either a lunar month, that is, a period of twenty-eight days, or a calendar month. At common law, "month" generally means a lunar month, although in mercantile matters it has been generally understood to mean a calendar month, but there is no general exception giving it that meaning in commercial documents. It can only have that meaning where according to the ordinary rules of construction a secondary meaning can be admitted (Brunner v. Moore, 1904, 1 Ch. 305). In bills of exchange or promissory notes month means a calendar month (Bills of Exchange Act, 1888, s. 14 [4]). Where a servant is engaged subject to a month's notice or payment of a month's wages month is interpreted as a calendar month (Gordon v. Potter, 1 F. & F. 644). In acts of parliament passed before the year 1850 month, unless otherwise interpreted, means lunar month, but in all acts passed since that date, month, unless words be added showing that lunar month was intended, means calendar month (Interpretation Act 1889, s. 3). In the rules of the supreme court and in the county court rules month means a calendar month. In mercantile contracts in computing the period of a month the day from which the time is to begin to run is excluded, but in sentences of imprisonment the day on which the sentence begins is included, so that the numerically corresponding
day in the month in which the sentence expires would be excluded.

MONTHOLON, CHARLES TRISTAN, MARQUIS DE (1752–1853), was born at Paris. He was trained for a military career, and in his tenth year shared in the expedition of Admiral Truguet to the coast of Sardinia. Entering the army in 1798, he rose with rapidity and avowed himself Napoleon's chief d'escadron in Paris, at the time of the coup d'état of Brumaire (November 1799), entirely devoted to Bonaparte. He served with credit in the ensuing campaigns, and distinguished himself at the battle of Aspern-Essling (May 1809) where he was wounded. At the end of that campaign on the Danube he received the title of count and remained in close attendance on Napoleon, who confided to him several important duties, among others, a mission to the Archduke Ferdinand at Würzburg. At the time of the second abdication of Napoleon at Fontainebleau (April 11, 1814), Montholon was chosen as one of the few generals who advocated one more attempt to rally the French troops for the overthrow of the allies. After the second abdication (June 22, 1815) he with his wife accompanied the emperor to Rochefort, where Napoleon and his friends finally adopted the proposal, which emanated from Count Las Cases (q.v.), that he should throw himself on the generosity of the British nation and surrender to H.M.S. "Bellerophon." Montholon afterwards, at Plymouth, asserted that the conduct of Captain Maitland of the "Bellerophon" had been altogether honorable, and that the responsibility for the failure must rest upon General Las Cases and himself. Montholon accompanied the ex-emperor to St Helena. To Montholon chiefly, Napoleon dictated the notes on his career which form so interesting, though far from trustworthy, a commentary on the events of the first part of his life. Montholon is known to have despised and flouted Las Cases, though in later writings he affected to laud his services to Napoleon. With Gourgas, who was no less vain and sensitive than himself, there was a standing feud, which would have led to a duel but for the express prohibition of Napoleon. Las Cases left the island in November 1816, and Gourgas in January 1818; but Montholon, despite the departure of his wife, stayed on at Longwood to the end of the emperor's life (May, 1821). In a letter written to his wife he admitted that Napoleon died of cancer, though he afterwards encouraged the belief that death was due to a liver complaint aggravated by the climate and by the restrictions to which Napoleon was subjected. After that event Montholon and Bertrand became reconciled to Sir Hudson Lowe (q.v.); but this did not prevent him, on his return to France, from vilifying that much abused man. Colonel Basil Jackson found him very frank as to the politique de Long- wood; he represented Sir Hudson Lowe as a man irreligious, and Sir Hudson Lowe as his persecutor. Montholon admitted that an "angel from heaven as governor would not have pleased them." Montholon had to spend many years in Belgium; and in 1840 acted as "chief of staff" in the absurd "expedition" conducted by Louis Napoleon from London to Boulogne. He was condemned to imprisonment at Ham, but was released in 1847; he then retired to England and published the Récits de la captivité de Napoléon à St. Hélène. In 1848 he became one of the deputies for the Legislative Assembly under the Second Republic. He died on the 30th of August 1854.

See Recueil de pièces authentiques sur le captif de St Hélène: suivi de lettres de MM. le Général Montholon, &c. (Paris, 1821); Mémoires pour servir à l'histoire de France sous Napoléon (ed. Gourgas and Montholon, Paris, 1823; Eng. ed., London, 1823; new ed., Paris, 1905); Récits de la captivité de l'empereur Napoléon à St Hélène (2 vols., Paris, 1847). Also the Marquise of Montholon's Souvenirs de St. Hélène, 1815–16 (Paris, 1882). Montholon's own writings the only one of note is De l'Armée française (1834). For the conversations of Montholon with Basil Jackson in 1828, see Lieut.-Colonel Basil Jackson, Notes and Reminiscences of foreign travel, from 1824 to 1830 (1829).

MONTH'S MIND, in medieval and later England a service and feast held one month after the death of anyone in his or her memory. Bede speaks of the day as commemorationem dies. These "Minding days" were of great antiquity, and were survivals of the Norse minne or ceremonial drinking to the dead. "Minning Days," says Blount, "from the Saxon Lymynde, days which our ancestors called their Montes mind, their Year's mind and the like, being the days whereon their souls (after their deaths) were had in special remembrance, and some office or obsequies said for them, as Orchits, Dirges." The phrase is still used in Lancashire. Elaborate instructions for the conduct of the commemorative service were often left in wills. Thus, one Thomas Windsor (who died in 1749) orders that "on my montch's mind there be a hundred children within the age of sixteen years, to say for my soul," and candles were to be burned before the rood in the parish church and twenty priests were to be paid by his executors to sing Placeba, Dirige, &c. In the correspondence of Thomas, Lord Cromwell, one in 1536 is mentioned at which a hundred priests took part in the mass. Commemorative sermons were usually preached, the earliest printed example being one delivered by John Fisher, bishop of Rochester, on Margaret, countess of Richmond and Derby, in 1500.

MONTILLA, a town of southern Spain, in the province of Cordova, 32 m. S. of the city of Cordova, by the Cordova-Bobadilla railway. Pop. (1900), 13,603. The oil of the district is abundant and good; and it is the peculiar flavour of the pale dry light wine of Montilla that gives its name to the sherry known as Amontillado. Montilla was the birthplace of "The Great Captain," Gonzalo or Gonsalvo de Cordova (1453–1513), and contains the ruined castle of his father, Pedro Fernandez de Cordova.

MONTLISER, FRANÇOIS DOMINIQUE DE REYNAUD, COMTE DE (1755–1838), French publicist, was born at Clermont-Ferrand (Puy-de-Dôme) on the 16th of April 1755, the youngest of a large family belonging to the poorer nobility. He was returned in 1791 to the Constituent Assembly, where he sat on the Royalist side, and he emigrated on its dissolution in September 1791. He was received into the emigrant army at Coblenz after some protest against the Liberal leanings he had shown in the Assembly. After the cannonade of Valmy, he withdrew to Hamburg, and thence to London, where he avoided English society, moving exclusively among the French exiles. In his Courrier de Londres, published in London, he advocated moderation and the abandonment by the exiles of any idea of revenge. He was recalled to Paris in 1801, with permission to publish his paper in London. The Courrier was soon suppressed, nevertheless, its editor being compensated by a comfortable sinecure in the ministry of foreign affairs. The next year he sold his pen to the government to edit the violent anti-English Bulletin de Paris. At Napoleon's request he undertook an account of the ancient monarchy of France, which should serve as a justification for the empire. After four years' labour Montliser submitted his work to the government as a monarchical chart, which was rejected because of the stress laid on the feudal limitations of the royal authority. The work De la monarchie française... ou recherches sur les anciennes institutions françaises... et sur les causes qui ont amené la révolution... appeared in 1814 in three volumes, a fourth and supplementary volume in the next year containing a preface hostile to Napoleon. His views were no more acceptable to Louis XVIII. than they had been to the emperor, and he devoted himself to agriculture until he was roused by the clerical and reactionary policy of Charles X. His Memoires sur les méurs, les moeurs, les mœurs religieux, politique,... (1826) rapidly passed through eight editions. He had no part in the revolution of 1830, but supported Louis Philippe's government and entered the House of Peers in 1832. He died on the 9th of December 1838 at Blois. Ecclesiastical burial was denied him because he had refused to abjure his anti-clerical writings.

Among his works should be mentioned: Mémoires sur la révolution française, le consulat, l'empire, la restauration, et les principaux événements qui l'ont suivie (2 vols., 1820).

MONTLUC (or MONTLIC), BLAISE DE LASSARAN-MASSENCÔME, SEIGNEUR DE (c. 1502–1572), marshal of France, was born about 1502, at the family seat near Condom in the modern department of Gers. He was the eldest son, and his family was a good one, but, like most gentlemen of Gascony, he had to
trust to his sword. He served first as a private archer and man-at-arms in Italy, with Bayard for his captain, fought all through the wars of Francis I., and was knighted on the field of Cerbola (1544), to which victory he had brilliantly contributed as adviser to the young duke of Enghien. Having apparently enjoyed no patronage, he was by this time a man of middle age. Thenceforward, however, his merits were recognized. His chief feat was the famous defence of Siena (1555), which he has told so admirably. When the religious wars broke out in France, Montluçon, a staunch royalist, held Guyenne for the king. Henry III. made him in 1574 marshal of France, an honour which he had earned by nearly half a century of service and by numerous wounds. He died at Estillac near Agen in 1577. Montluçon's entrance at the head of the adherents of this Commentaires de Messeire Blaise de Montduc (Bordeaux, 1592), in which he described his fifty years of service (1521-1574). This book, the "soldier's Bible" (or "breviary," according to others), as Henry IV. called it, is one of the most admirable of the many admirable books of memoirs produced by the unlearned gentry of France at that time. It is said to have been dictated, which may possibly account in some degree for the singular vivacity and picturesque style of the

The Commentaires are to be found conveniently in the collection of the French Army, which was published in 1616 by order of the Society of the History of France, ed. by M. de Ruble (5 vols., 1865-1872). See Rastow, Militärische Biographien, v. i. (Zürich, 1858).

MONTLUCON, a town of central France, capital of an arrondissement, and the most important industrial centre in the department of Allier. Pop. (1906), 31,888. It is situated on the Cher, 50 m. S.W. of Moulins by the Orléans railway. The upper town, on an eminence on the right bank, consists of steep, narrow, winding streets, and preserves several buildings of the 15th and 16th centuries; the lower town, traversed by the Cher, is the seat of the industries, which embrace the manufacture of glass, chemicals, mirrors, sewing-machines, and iron and steel production. The Commenry coal-mines and Néris, a town with thermal springs, are a few miles distant to the south-east. Of the churches, Notre-Dame is of the 15th century, St Pierre partly of the 12th and St Paul modern. The town-hall, with a library, occupies the site of an old Ursuline convent, and two other convents are used as college and hospital. Overlooking the town is the castle rebuilt by Louis II., duke of Bourbon, and taken by Henry IV. during the religious wars; it serves as a barracks. Montluçon is the seat of a sub-prefect and has tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce and a lycée. The town, which formed part of the duchy of Bourbon, was taken by the English in 1717, and by Philip Augustus in 1181; the English were beaten under its walls in the 14th century.

MONTMORENCY, the name of one of the oldest and most distinguished families in France, derived from Montmorency, now in the department of Seine-et-Oise, in the immediate neighbourhood of Enghien and St Denis, and about 9 m. N.N.W. of Paris. The family, since its first appearance in history, in the person of Boucard I., sire de Montmorency in the 10th century, has furnished six constables and twelve marshals of France, several admirals and cardinals, numerous grand officers of the Crown and grand masters of various knightly orders, and was declared by Henry IV. to be, after that of the Bourbons, the first house in Europe. MATTHIEU I., sire de Montmorency, received in 1138 the post of constable, and died in 1160. His first wife was Aline, the natural daughter of Henry I. of England; his second, Adelaide or Alice of Savoy, widow of Louis VI. and mother of Louis VII., and according to Duchene, he shared the regency of France with Stephen of Chartres, during his departure. Matthieu II. had an important share in the victory of Bouvines (1214), and was made constable in 1218. During the reign of Louis VIII. he distinguished himself chiefly in the south of France (Niort, La Rochelle, Bordeaux). On the accession of Louis IX. he was one of the chief supporters of the queen-regent Blanche of Castile, and was successful in reducing all the vassals to obedience. He died in 1230. His younger son, Guy, in right of his mother, became head of the house of Montmorency-Laval. Anne de Montmorency (q.v.), so named, it is said, after his godmother Anne of Brittany, was the first to attain the feudal title (1551). His eldest son, FRANÇOIS de Montmorency (1520-1579), was married to Diana, natural daughter of Henry II.; another son, HENRI I. de Montmorency (1554-1614), who became duc de Montmorency on his brother's death in 1570, had been governor of Languedoc since 1563. As a leader of the party called the Politiques he took a prominent part in the French wars of religion. In 1593 he was made constable, but Henry IV. showed some anxiety to keep him away from Languedoc, which he ruled like a sovereign prince. HENRI II. (1555-1620), son of duke Henry I., died in 1620. His son, and heir to the title in 1621, having previously been made grand admiral. He also was governor of Languedoc. In 1623 he defeated the French Protestant fleet under Soubise, and seized the islands of Ré and Oleron, but the jealousy of Richelieu deprived him of the means of following up these advantages. In 1628-1629 he was allowed to command against the duke of Rohan in Languedoc; in 1630 he defeated the Piedmontese, and captured Prince Doria, at Avignon, and took Saluzzo. In the same year he was created marshal. In 1632 he joined the party of Gaston, duke of Orleans, and placed himself at the head of the army of the South. He was defeated at Saverne by Castelnaudary (Sept. 1, 1632); severely wounded, he fell into the enemy's hands, and, abandoned by Gaston, was executed as a traitor at Toulouse on the 30th of October. The title passed to his sister CHARLOTTE-MARGUERITE, princess of Condé.

From the barons of Fosseaux, a branch of the Montmorency family established in Brabant in the 15th century, sprang the seigneurs of Boutteville, among whom was the duellist François de Montmorency-Boutteville, who was beheaded in 1627. His son, François Henri, marshal of France, became duc de Luxembourg by his marriage with Madeleine Charlotte Bonne Thérèse de Clermont, daughter of Marguerite Charlotte de Luxembourg, duchesse de Piney. Charles François Frédéric, the son of the marshal, was created duke of Beaufort in 1688 and duke of Montmorency in 1689. In 1767 the title of duke of Beaufort-Montmorency passed by marriage to another branch of the Montmorency-Fosseaux. This branch becoming extinct in 1865, the title was taken by the duc de Valençay, who belonged to the Talleyrand-Périgord family and married one of the heiresses of this branch of the Montmorency family. There were two other branches of the Montmorency family, among others that of the seigneurs of Laval (q.v.), a cadet branch of which received the title of duke of Laval and settled on the estate of Magnac in 1758. It is to this branch that Mathieu, duc de Montmorency (1767-1826), diplomatist and writer, and tutor of Charles X.'s grandson, Henri, duke of Bourbon, belonged.

MONTMORENCY, ANNE, DUC DE (1493-1557), constable of France, was born at Chantilly, and was brought up with the future King Francis I., whom he followed into Italy in 1525, distinguishing himself especially at Marignano. In 1516 he became governor of Novara; in 1520 he was present at the Field of Cloth of Gold, and afterwards had charge of important negotiations in England. Successful in the defence of Mézières (1521), and as commander of the Swiss troops in the Italian campaign of the same year, he was made marshal of France in 1522, accompanied Francis into Italy in 1524, and was taken prisoner at Pavia in 1525. Released soon afterwards, he was one of the negotiators of the treaty of Madrid, and in 1530 reconducted the king's sons into France. On the renewal of the war by Charles V.'s invasion of France in 1536, Montmorency compelled the emperor's grandson to retire, and in 1540 he accompanied the king of France into Picardy, and on the termination of the Netherlands campaign marched to the relief of Turin. In 1538, on the ratification of the ten years' truce, he was rewarded with the office of constable, but in 1541 he fell into disgrace, and did not return to public life until the accession of Henry II. in 1547. In 1548 he repulsed the insurrections in the south-west, particularly at Bordeaux, with great severity,
and in 1549–50 conducted the war in the Boulonnais, negotiating the treaty for the surrender of Boulogne on the 24th of March 1550. In 1551 his barony was erected into a duchy. Soon afterwards his armies found employment in the north-east in connexion with the seizure of Metz, Toul and Verdun by the French king. His attempt to relieve St Quentin resulted in his defeat and captivity (Aug. 19, 1557), and he did not regain his liberty until the peace of Cateau-Cambrésis in 1559. Supplanted in the interval by the Guises, he was treated with coldness by the new king, Francis II, and compelled to give up his mastership of the royal household—his son, however, being appointed marshal by way of indemnity. On the accession of Charles IX. in 1560 he resumed his offices and dignities, and, uniting with his former enemies, the Guises, played an important part in the Huguenot war of 1562. Though the arms of his party were victorious at Dreux, he himself fell into the hands of the enemy, and was not liberated until the treaty of Amboise (March 19, 1563). In 1567 he again triumphed at St Denis, but received the death-blow of which he died at Paris, on the 25th of March, 1567.

See F. Decrue, *Anne de Montmorency* (Paris, 1885), and *Anne, duc de Montmorency* (Paris, 1886).

**MONTMORENCY, Mathieu Jean Félicité de Montmorency-Laval, Duc de** (1766–1826), French politician, was born in Paris on the roth of July 1766. He served with his father, the vicomte de Laval, in America, and returned to France imbued with democratic opinions. Mathieu de Montmorency was governor of Compiègne when he was returned as deputy to the states-general in 1789, where he joined the Third Estate and sat on the left of the Assembly. He moved the abolition of armorial bearings on the 19th of June 1790. The dissolution of the Constituent Assembly in September 1791 set him free to join Lückner’s army on the frontier early in the next year. After the revolution of the 10th of August he abandoned his revolutionary principles; and he took no part in politics under the empire. At the Restoration he was promoted maréchal de camp, and accompanied Louis XVIII. to Ghent during the Hundred Days. At the second restoration he was made a peer of France, and two years later received the title of viscount. He adopted strong reactionary and ultramontane views, and became minister of foreign affairs under Villèle in 1812. He recommended armed intervention in Spain at the Congress of Verona in October 1812, but he resigned in December, being compensated by the title of duke and the cross of the Legion of Honour in the next year. He was elected to the French Academy in 1825, though he appears to have had small qualifications for this distinction. In the next year he became tutor to the six-year-old Henri, duke of Bordeaux (afterwards known as the comte de Chambord). He died two months after receiving this last appointment, on the 24th of March 1826.

See Vétillard, *Notice sur la vie de M. le duc Mathieu de Montmorency* (Le Mans, 1826), and, for his curious relations with Mme de Staël, P. Gautier, *Mathieu de Montmorency et Mme de Staël, d’après les lettres inédites de M. de Montmorency à Mme Necker de Saussure* (1806).

**MONTMORENCY**, a town of northern France in the department of Seine-et-Oise, 23 m. from the right bank of the Seine and 17 m. N. of Paris by rail. Pop. (1906), 49,032. The Pop. (1900), 49,032. The town was the seat of the family of Montmorency. There is a church built for the most part in the 16th century by Anne de Montmorency. The town is a well-known resort of Parisians. To the north-east lies the fine forest of Montmorency. Bleaching and dyeing and the manufacture of lime plaster, bricks and tiles are carried on. About a mile south-west lies Enghien-les-Bains (pop. 49,032), the waters of which are used in cases of catarrh and skin disease.

**MONTMORILLON**, a town of western France, capital of an arrondissement in the department of Vienne, on the Garonne, 34 m. E.S.E. of Poitiers by rail. Pop. (1906), 9,294. The ecclesiastical seminary occupies a building of the 12th century, formerly an Augustinian convent. The convent church is Romanesque in style and there is a curious two-storied chapel of octagonal form, of the same period. The church of Notre-Dame is a combination of Romanesque and Gothic, dating from the 12th and 13th centuries.

**MONTMORIN DE SAINT HÉRÉM, ARMAND MARC, COMTE DE** (1745–1792), French statesman, belonged to a cadet branch of a noble family of Auvergne. He was gentleman-in-waiting to Louis XVI. when dauphin, and was subsequently appointed ambassador at Madrid. From Madrid he was suddenly summoned to the government of Brittany, and in 1787 was appointed by the king to succeed Vergennes in the ministry of foreign affairs. Montmorin was a devoted admirer of Necker, whose influence at the court he was mainly instrumental in maintaining. He retired when Necker was dismissed on the 12th of July 1789, but on Necker's recall after the taking of the Bastille again resumed his office, which he continued to hold till October 1791. Mirabeau (q.v.) had approached him so early as December 1788, with a plan for the policy of Necker. He was by the court towards the new states general; but Montmorin, offended by Mirabeau’s attacks on Necker and by his *Histoire secrète de la cour de Berlin*, refused to see him. With the progress of the Revolution, however, this attitude was changed. The comte de la March was exerting himself to bring Mirabeau into touch with the court (see MIRABEAU), and for this purpose it was important to secure the assistance of Montmorin. The convenience of an understanding between the two men was obvious; and they were soon on the closest terms. While Montmorin was on friendly terms with Necker, he was, however, in fact. Montmorin did not dare to come to a decision without consulting his masterful friend, but on the other hand neither Mirabeau nor La March were under any illusions as to the broken character of the man on which they had perforce to lean. Mirabeau complained bitterly that Montmorin was “slack” (flasque) and a “poltroon” (gavache). On the other hand, La March thought that Montmorin's feebleness was occasionally useful in restraining Mirabeau's impetuosity. The death of Mirabeau in April 1791 was a severe blow to Montmorin, the difficulty of whose position was enormously increased after the flight of the royal family to Varennes, to which he was not privileged. He was forced to resign office, but still continued to advise Louis, and was one of the inner circle of the king’s friends, called by the revolutionists “the Austrian Committee.” In June 1792 his papers were seized at the foreign office, without anything incriminating being discovered; in July he was denounced, and after the 10th of August was proscribed. He took refuge in the house of a washerwoman, but was discovered, halted before the Legislative Assembly, and imprisoned in the Abbaye, where he perished in the September massacres. His relative, Louis Victor Henri, duc de Saint Hérem, head of the elder branch, also perished in the massacre.

**MONTOLIVA,** a town of southern Spain, in the province of Córdoba, in the March of Cordova, on the Madrid-Cordoval railway. Pop. (1900), 14,581. Montoliva was the *Epara* of the Romans, and became an important Moorish fortress in the middle ages, but it has been largely modernized. It stands on a rocky peninsula on the south bank of the Guadalquivir, here crossed by a fine bridge of four arches dating from the 16th century. Oil is largely manufactured, and there is considerable trade in timber, agricultural produce and livestock.

**MONTPELLIER,** a city, the capital of Vermont, U.S.A., and the county-seat of Washington county, on the Winooski river, 8 m. (by rail) E.S.E. of Burlington. Pop. (1900), 6,606 (952 foreign born); (1910), 7,856. Montpellier is served by the Central Vermont and the Montpellier & Wells River railways. Barre granite is mined extensively in the vicinity, and the city manufactures marble and granite products, flour, lumber, saddlery.
Agriculture

The privilege of the city are the United States government building, the county court house, the Montpellier seminary and the Wood art gallery, a collection consisting principally of paintings by Thomas Waterman Wood (1823–1903), a native of Montpellier. The town of Montpellier, named from the city in France, was granted to a company of sixty proprietors in 1760. The first permanent settlement was made in 1787; and the town was organized in 1793 under a charter of 1781, replaced by another in 1804. It was incorporated as a city by Louis XVI., and in 1808 the legislature met here for the first time.

First the town was a part of Orange county, but in 1810 Washington county was created, and in 1811 Montpellier became the seat of government of the new county. In 1849 East Montpellier was set apart as a separate township, and in 1894 the town of Montpellier was chartered as a city.

Montpellier, a town of southern France, capital of the department of Hérault, about 7 m. from the Mediterranean, and 30 m. from the Rhone. The railway from Paris-Lyon railway between the town and Cette. Pop. (1906) 6,179. Montpellier is a university and the principal place of Lower Languedoc, is situated in a fruitful plain less than a mile from the right bank of the small river Léz. Composed for the most part of narrow winding streets, the town has at the same time several spacious thoroughfares and some fine squares and promenades, notably the much-frequented Place de la Comédie, the Esplanade and the Peyrou. The last terminates in a terrace commanding a magnificent view of the coasts of the Mediterranean, and of the Pyrenees and Alps. On the terrace is situated the reservoir of the town, which was brought from a distance of about 8 m. by an aqueduct. In the centre of the square is an equestrian statue of Louis XIV., while opposite the entrance is the Porte de Peyrou, a triumphal arch erected at the end of the 17th century to commemorate the achievements of Louis XIV. The Boulevard Henri IV. to the north leads past the botanical garden, founded in 1935 and thus the oldest in France, the medical college, and the cathedral; to the east the Rue Nationale leads to the palace of justice, the prefecture, and the citadel.

The cathedral (14th century), which until 1536 was the church of a Benedictine monastery, suffered severely during the religious wars, and about the middle of the 19th century the choir and one of the four towers at the angles of the nave were rebuilt in the style of the 13th century. The monastery, after being converted into the bishop's palace, has since 1795 been occupied by the famous medical school. A gallery devoted to the portraits of professors since 1235 contains one of Rabelais. Close to the medical school is the Tour des Pins, the chief relic of the medieval fortifications. The museum (Musée Fabre) contains rich collections of Italian, Flemish, Dutch and modern French paintings and of French sculptures. Its nucleus was the collection given to it by the painter F. X. P. Fabre (1766-1837), born at Montpellier. The principal public buildings are the palace of justice—a modern structure, the theatre and the prefecture, also modern. Montpellier possesses old houses of the 15th and 16th centuries. The Léz is canalized so as to connect Montpellier with the canal du Midi and with the sea at Palavas. The town has a considerable trade in wine, brandy, fruit and silk. The principal industrial establishment is a manufactory for candles and soap. There are also tanneries, distilleries and manufactures of cotton and woollen goods, chemicals, cais, hosiery and silks, &c. It was in 1831 the centre of an académie (educational division) and has long been renowned as a seat of learning. Montpellier university comprises faculties of medicine, law, science and letters, and a higher school of pharmacy. Montpellier is also the seat of a bishop and a prefect, of courts of appeal and assizes, tribunals of first instance and of commerce, a chamber of commerce, a board of trade arbitration, and headquarters of the VI. army corps.

Montpellier first rose into importance after the destruction of Maguelonne by Charles Martel in 737. In the 10th century it consisted of two portions, Montpellier and Montpelleret, held from the bishops of Maguelonne by the family of Guilm. The Guillemes were succeeded, through marriage, by the house of Aragon, a member of which in 1349 sold his rights to Philip of Valeis, Montpellier had already in 1292 been ceded to the Crown by the bishops. In 1141 Montpellier acquired a charter afterwards materially extended, and the same century saw the rise of its school of medicine. Several of the ablest teachers of that school were members of an important Jewish colony established in the town. It had a school of law in 1160, and a university was founded by Pope Nicholas IV. towards the close of the 13th century under Louis IX. Then followed the right of free trade with the whole of the kingdom, a privilege which greatly increased its prosperity. The importance of the town was enhanced when the bishopric of Maguelonne was transferred thither in 1356. During the wars of religion the town was a stronghold of the Protestants, who captured it in 1567. It strenuously supported the duke of Rohan in his revolts and in 1632 only succumbed to Louis XIII. after a siege of eight months. In 1638 the duke was defeated there and the walls were taken.

The town was again captured and held by the English in 1648; its possession was ceded to France in 1659; and in 1674 it was taken by the English again. The town was again captured by the French in 1681, and held by them until 1791. The town was again captured and held by the English in 1648; its possession was ceded to France in 1659; and in 1674 it was taken by the English again. The town was again captured by the French in 1681, and held by them until 1791. The town was again captured and held by the English in 1648; its possession was ceded to France in 1659; and in 1674 it was taken by the English again. The town was again captured by the French in 1681, and held by them until 1791.

See A. C. Germain, Histoire du commerce de Montpellier antérieurement à l'ouverture du port de Cette (2 vols., Montpellier, 1861), and Histoire de la commune de Montpellier (3 vols., Montpellier, 1851); Agrecheville, Histoire de la ville de Montpellier (4 vols., Montpellier, 1875-1882).

Montpensier, Counts and Dukes of. The French lordship of Montpensier (department of Puuy-de-Dôme), which became a county in the 14th century, was sold in 1384 by Bernard and Robert de Ventadour to John, duke of Berry, whose daughter Marie brought the county to her husband, John I., duke of Bourbon, in 1400. The county was subsequently held by Louis de Bourbon, younger son of Duke John, and by his descendants up to Charles de Bourbon-Montpensier, the famous constable, who became duke of Bourbon by his marriage with his cousin, Suzanne de Bourbon, in 1505. Conquered by King Francis I., the county was restored in 1538 to Louise de Bourbon, sister of the constable, and widow of the prince de Condé. The county, containing the towns of Roche-sur-Yon, and to her son Louis (1551–1582), and was erected into a duchy in the peerage of France (duché-poitier) in 1539. Marie, daughter and heiress of Henri de Bourbon, duke of Montpensier, brought the duchy to her husband Gaston, duke of Orleans, brother of Louis XIII., whom she married in 1626, and their daughter and heiress (see below), known as "La Grande Mademoiselle," was duchess of Montpensier. The title subsequently remained in the Orleans family, and was borne in particular by Antoine Philippe (1775–1827), son of Philippe "Égalité," and Antoine Marie Philippe Louis (1824–1890), son of King Louis Philippe and father-in-law of King Alphonso XII. of Spain.

Montpensier, Anne Marie Louise d'Orléans, Duchesse de (1627–1663), French memoir-writer, was born at the Louvre on the 20th of May 1627. Her father was Gaston of Orleans, "Monsieur," the brother of Louis XIII. Her mother was Marie de Bourbon, heiress of the Montpensier family. Being thus of the blood-royal of France on both sides, and heiress to immense property, she appeared to be very early destined to a splendid marriage. It was perhaps the greatest misfortune of her life that this telling "la mademoiselle" was encouraged and forward to the throne of France as the result of a marriage with Louis XIV., who was, however, eleven years her junior. Ill- luck, or her own wilfulness, frustrated numerous plans for marrying her to persons of exalted station, including even Charles II. of England, then prince of Wales. She was just of age when the Fronde broke out, and, as contributing as she did her disappointments to Mazarin, she sympathized with it not a little. In the new or second Fronde she not only took nominal command of one of the
MONTREAL

armies on the princes' side, but literally and in her own person took Orleans by escalade. However, she had to retreat to Paris, where she practically commanded the Bastille and the adjoining pal. of the walls. On the 2nd of July 1652, the day of the battle of the Faubourg Saint Antoine, between the Frondende under Condé and the royal troops under Tyrrene, Mademoiselle sought Condé and his beaten troops by giving orders for the gates under her control to be opened and for the cannon of the Bastille to fire on the royalists. In the heat of the émeute which followed she installed herself in the Hôtel de Ville, and played the part of mediatrix between the opposed parties. Her political import-
tance lasted exactly six months, and did her little good, for it created a lifelong prejudice against her in the mind of her cousin, Louis XIV. She was for some years in disgrace, and resided on her estates. It was not till 1697 that she reappeared at court, but, though projects for marrying her were once not set on foot, she was now past her first youth. She was nearly forty, and had already corresponded seriously with Mme de Mottetville on the project of establishing a ladies' society "sans mariage et sans amour," when a young Gascon gentleman named Puyguilhem, afterwards celebrated as M. de Lauzun (q.v.), attracted her attention. It was some years before the affair came to a crisis, but at last, in 1670, Mademoiselle solemnly demanded the king's permission to marry Lauzun. Louis, who liked Lauzun, and who had been educated by Mazarin in the idea that Mademoiselle ought not to be allowed to carry her vast estates and royal blood to anyone who was himself of the blood-
royal, or even to any foreign prince, gave his consent, but it was not immediately acted on, as the other members of the royal family prevailed with Louis to rescind his permission. Not long afterwards Lauzun, for another cause, was imprisoned in Pignerol, and it was years before Mademoiselle was able to buy his release from the king by settling no small portion of her estates on Louis's bastards. The elderly lovers (for in 1681, when Lauzun was released, he was nearly fifty, and Mademoiselle was forty) lived for many years secretly so they had not gone through the ceremony ten years previously. But Lauzun tyrannized over his wife, and it is said that on one occasion he addressed her thus, "Louise d'Orléans, tire-moi mes bottes," and that she at once and finally separated from him. She lived for some years afterwards, gave herself to religious duties, and finished her Mémoires, which extend to within seven years of her death (April 9, 1693), and which she had begun when she was in disgrace thirty years earlier. These Mémoires (Amster-
dam, 1729) are of very considerable merit and interest, though, or perhaps because, they are extremely of a personal and extremely desultory. They are to be found in the great collection of Michaud and Poujoulat, and have been frequently edited apart. Her Eight Beatitudes has been edited by E. Rodocanachi as Un Ouvrage de piété inconnu (1908).

See the series of studies on La Grande Mademoiselle, by "Arvède Barine" (1902, 1903).

MONTREAL, a city of the Dominion of Canada, its leading seat of commerce and principal port of entry, as well as the centre of many of its important industries. It is situated on the south-
east of the island of Montreal, at the confluence of the Ottawa and St Lawrence rivers, in the county of Hochelaga and province of Quebec. The observatory in the grounds of McGill University, in the city, has been determined to be in 45° 30' 17" N. lat., and 73° 34' 40.05" W. long. The city holds a fine position at the head of ocean navigation, nearly a thousand miles inland, and at the foot of the great system of rivers, lakes and canals upon which the commerce of the interior is carried to the Atlantic seacoast. The ship channel below Montreal permits the passage of ocean vessels drawing 30 ft. at low water. The deepening of the channel, largely due to the initiative of Montreal merchants, was begun in 1844 by the government of Canada. The work was transferred to the Harbour Commissioners of Montreal in 1850. The depth of the channel was then 11 ft. Fifteen years later it had gradually been increased to 20 ft.; and in 1888, when the work was taken over by the Dominion government, the depth was 27 ft. 6 in. The Lachine canal, with the chain of artificial waterways that succeeded it, opened the way for the shipping of the Great Lakes. The first sod in the digging of the Lachine canal was turned in July 1821 by John Richardson of Montreal. The same public-spirited mer-
cicle, mounted in April from which the city derives its name, was at a preliminary meeting which led to the formation of the committee of trade, itself the forerunner of Montreal's indispensable board of trade. Even before the close of the French régime in Canada efforts had been made to cut a canal across the island of Montreal, and M.de Catalogue succeeded in building a waterway practicable for the canoes of the fur-traders. The more ambitious canal commenced in 1821 was completed four years later, at a cost of $440,000. Before its completion, however, the increasing draught of inland shipping made it practically useless, and in 1853 work was begun on an enlargement. Since then the canal has been repeatedly deepened, to keep pace with the require-
ments of lake shipping, until to-day a 14-ft. channel is available. In the meantime the rival method of rail transportation was taking shape, and in 1836 the first Canadian railway was opened, between Laprairie, opposite Montreal and St Johns, in the eastern townships. In 1848 a second railway, from Longueuil to St Hyacinthe, was opened; both these projects owing their exist-
ence to the enterprise of Montreal citizens. The broad St Lawrence, however, still lay between the city and the outside world. In 1854 work was begun upon the famous Victoria tabular bridge, designed by Robert Stephenson and his son. The bridge was opened by King Edward VII., then prince of Wales, in 1866. In 1886 it was replaced by the Victoria Jubilee bridge, built on the piers of the old bridge. At the foot of Lake St Louis, some distance above the Victoria Jubilee bridge, the Canadian Pacific railway crosses the river on a graceful cantilever bridge with two central spans each 408 ft. long. Montreal is on the Canadian Pacific, Grand Trunk, Intercolonial, Canadian Northern, New York Central, Rutland, Central Vermont and Delaware & Hudson railways. During the season of navigation vessels may sail through the St Lawrence canal, which exis-
tes between Montreal and Quebec, and which is 25 ft. deep and so much of its natural beauty, is a mass of trap-rock thrown up through the surrounding limestone strata to a height of 753 ft. above the level of the sea. Under the direction of Frederick Law Olmsted, it was converted into a magnificent park. Be-
tween mountain and river the Lachine canal winds through the plain. In the middle of the river lies the beautifully wooded St Helen's island, rising to a height of 150 ft. above the water, and itself commanding an excellent view of the city. The island, named after Helen Bouillé, wife of Champlain, belonged at one time to the barons of Longueuil. The British government pur-
chased it for military purposes, and it still contains a battery of guns and barricades, the latter tenantless, since the island has been loaned to the city for use as a public park.

The city is substantially built, grey limestone, quarried from the mountain, predominating in the public and many of the private edifices. On the south of the Place d'Armes, a small enclosure covering the site of an ancient burying-ground, stands the parish church of Notre Dame, whose Gothic outlines form one of the striking features of the city. Designed by James O'Donnell, the church was built in 1824 to take the place of an earlier structure dating back to 1752. The Stephen church is 255 ft. long and 134 ft. wide, and accommodates 10,000 worshippers. Its twin towers (227 ft.) contain ten bells, one of which, known as "Le Gros Bourdon," weighs 24,780 lb, the largest in America. Two others weigh respectively 6041 and 3633 lb. Beside the church stands the historic seminary of St Sulpice, one of the
few remaining relics of the days of French rule. This ancient building is now used for the offices of the Order of Sulpicians, founded by the Abbé Olier in the early half of the 17th century. The church must always be associated with the name of Louis de Maisonneuve, in 1641 to establish the missionary enterprise which afterwards developed into the city of Montreal, and six years later the Abbé de Quelus, with three devoted companions, landed at Ville-Marie de Montreal and laid the foundations of the future powerful Order of Sulpicians. The seigneurie of Montreal, acquired by Olier in 1649, is still held by the Sulpicians, and as they have retained large blocks of land in the heart of the city as well as elsewhere on the island, these "Gentlemen of the Seminary," as they were locally called, rank among the wealthiest landlords in America. It is the offices of the Bank of Montreal face Notre Dame church, on the north of the Place d'Armes, and several other of the leading banking institutions of the city have their quarters in the immediate neighbourhood. In the Place d'Armes itself stands a striking figure in bronze erected to the memory of the founder of Montreal, Maisonneuve. At the base are a series of bas-reliefs setting forth historical incidents connected with the early history of the town. The monument is the work of a Canadian sculptor, Louis Philippe Hébert, C.M.G. The Roman Catholic cathedral of St James stands just north of the Place d'Armes. It was burned in 1754, the present church, erected in 1755, is the exact reproduction of the old church, reduced to one-half the scale, of St Peter's at Rome. The building, projected by the late Archbishop Bourget to replace the old church on St Denis street destroyed in the great fire of 1852, was begun in 1868. On the west of the square stand the Windsor Street station of the Canadian Pacific railway; St George's (Anglican) church, which possesses a fine chime of bells; and the Windsor Hotel. A statue of Sir John Macdonald occupies the centre of the square. Close to the historic Bonsecours Market stands the church of Notre Dame de Bonsecours, founded by Sister Marguerite Bourgeois in 1673 as a sanctuary for a miraculous statue of the Virgin. The original church was burned in 1754, and the present building, erected in 1771, is an example of Norman architecture transplanted to the New World, narrowly escaped destruction to make room for a railway station. Curiously enough, it remained for a number of English Protestants to secure the preservation of this relic of the French period. Jacques Cartier Square, adjoining Bonsecours Market, is notable for its column and statue of Nelson, erected in 1868. As the Roman Catholic cathedral owes its existence to the energy and enthusiasm of Archbishop Bourget, so Christ Church cathedral at its completion in 1897 is associated with the name of the resident Anglican bishop of Montreal, Dr Fulford. The church is a fine example of the Early English style of architecture. Beside it stands a memorial of Bishop Fulford, modelled after the famous Martyr's Memorial at Oxford.

The mixture of races and creeds, which is so striking a characteristic of Montreal life, has not only endowed the city with many beautiful churches, but also with varieties of philanthropic institutions. Each of the several national societies—St George's, St Andrew's, St Patrick's, and that of the French-Canadian patron saint, St Jean Baptiste, to mention no others—looks after the welfare of its own adherents. Of the several hospitals, the most venerable is the Hôtel Dieu, founded in 1644 by Mme de Bouillon, a French lady of high rank. The original building, in the early days of Ville Marie, stood without the fort, and was fortified to withstand the attacks of the Iroquois. The site is now covered by a block of warehouses on St Paul Street. The present buildings, completed in 1861, contain both a hospital and nunnery. The Order of the Grey Nuns, founded by a Canadian lady, Mme d'Youville, in 1737, cares for hundreds of foundlings and aged and infirm people in the great hospital in Guy Street. The Montreal General hospital was founded in 1819 by public subscriptions, and the Royal Victoria hospital is a monument to the generosity of Lord Strathcona and Lord Mount-Stephen. Besides these should be mentioned the Notre Dame, the Western and the Children's Memorial hospitals. Separate hospitals for contagious diseases are maintained both by the Roman Catholics and Protestants.

Montreal provides for the education of its young people through two distinct systems of public schools, one for Roman Catholics, the other for Protestants, each governed by a board of commissioners. The schools are maintained by an annual tax based upon the assessment, two-fifths of 1% being levied upon the Protestant section of the community for the support of the Protestant schools, and one-quarter of 1% upon the Catholics for their schools. Unlike the neighbouring provinces of Ontario, Quebec makes no provision for a state university. But James McGill (1744-1813) left property, valued at the time of his death at £20,000, for the foundation of a university, one college of which was to bear his name. A royal charter conferring university powers was obtained in 1821. During early years slow progress was made, but with the appointment of Sir William Dawson as principal, in 1852, the institution entered on a career of prosperity. It now embraces five faculties: arts, applied science, law, medicine, agriculture, and comprises the following: McGill College, Montreal, the original foundation; the Royal Victoria College for Women, Montreal, built and endowed by Lord Strathcona; four affiliated theological colleges in Montreal; the Macdonald College, erected and endowed by Sir William C. Macdonald, at Ste Anne de Bellevue, 20 m. from the city; the McGill University College of British Columbia, Van- couver, B.C.; and three affiliated institutions of the Basque order of Sulpicians: St Jean Vianney College, Stanstead, P.Q.; Victoria College, Victoria, B.C.; Alberta College, Edmonton. The finely-equipped Macdonald scientific laboratories, with the Redpath Museum and University Library in 1907), form part of a noble group of buildings on the campus in Montreal. Disastrous fires in April 1907 wiped out two buildings and destroyed the splendid medical museum, but the plans for rebuilding provided for further extension and improvement. Previous to the fires the property of the university in buildings in Montreal, including equipment and endowment, was valued at $6,000,000.

The French university of Laval, the chief seat of which is in the city of Quebec, also maintains a branch at Montreal, established in 1877. It embraces the faculties of arts, law, medicine and theology, the latter conducted through the Seminary of St Sulpice. The college library has been enriched by a rare collection of Canadian books and manuscripts, bequeathed by Judge Louis François Georges Baby (1834-1906), of Montreal. The medical school, which now occupies a portion of the university building, formerly held its sessions in the historic Chateau de Ramezy, burner by fire in 1704, and occupied after the death of the British governors of Canada, until the stoning of Lord Elgin and the burning of the Parliament Buildings in 1849 brought about the removal of the seat of government from Montreal. The Chateau de Ramezy is now the fitting home of a public collection of historic relics. Of other educational institutions in the city the most important is St Mary's College, founded in 1848 by the Jesuits, and removed to the present building in 1853. The archives boast a notable collection of early Canadian manuscripts, upon which Francis Parkman drew in preparing his histories of New France.

Montreal's position as the chief doorway of the outgoing and incoming trade of the Dominion is largely due to the foresight of her great merchants. With the gradual opening up of means of communication by land and water, and the development of her facilities for handling the exports and imports of the country, the city has increased rapidly in importance, until to day one-third of the imports of the Dominion come through Montreal, and nearly 30% of the exports. In shipments of grain Montreal has outstripped all her rivals on the continent except New York and the Ontario navigation of the Georgian Bay canal will, by materially shortening the distance between the western grainfields and European markets, give her a very considerable advantage over both these ports. In dairy produce she is already the chief export centre of the continent. Montreal is also the financial centre of Canada, and in it are to be found the head offices of more than 25 important banks, of the leading insurance companies, and of the two greatest railways of the country.
Montreal is governed by a mayor and 36 aldermen, elected every two years. The city returns 5 members to the Dominion House of Commons and 6 to the Provincial Legislature of Quebec.

The population of Montreal, according to the census of 1901, was 266,826. With the suburbs, it was estimated in 1907 at over 405,000, about three-fifths French.

The history of the town is steeped in romance. From that first remnant site, so graphically described by Francis Parkman, when, on the 18th of May 1642, Maisonneuve and his little band of religious enthusiasts landed upon the spot where the Montreal Custom House now stands, and planted, in the words of the saintly Dumont, a grain of mustard seed destined to overshadow the land, the history of the town was to be intimately associated with missionary enterprise and such missionary heroism as the world has rarely seen. Montreal began as a religious colony, but its very situation, on the outer confines of civilization and at the door of the Iroquois country, forced it to become, next, a fortified town with a military garison. Similarly its position, even then an ideal one from a commercial point of view, made it the dominating centre of the fur-trade. For a hundred years after its foundation these three influences held sway, more or less mutually antagonistic, the streets of Montreal presenting an animated picture of sombre priests and jovial soldiers, savage hunters in their native inery and more than half-savage fur traders. Within another hundred years, although both priests and soldiers were still to be seen on horseback and became by atoms in a larger and more varied population. The fur trader had become a trader, a New France, merged after the conquest in the fur trader of the North West Company—which had its origin in Montreal—remained for a time the picturesque survival of earlier and more romantic days. Finally, he too disappeared in the multiform and strenuous life of the modern city.

MONTRESOR, CLAUDE DE BOURDEILLE, COMTE DE (c. 1606–1663), French intriguer and memoir-writer, was the grand-nephew of Pierre de Brantôme. He was the second favourite of Gaston, duke of Orleans, the weak brother of Louis XIII., succeeding Antoine de Laape, due de Puylaurens, in this position in 1635. He planned the assassination of Cardinal Richelieu at the camp of Amiens in 1636, a plan which failed through the cowardice of Orleans. Montresor was obliged to spend the next six years on his estate, but in 1642 he entered into the plot of Cinq Mars against Richelieu. On its failure he escaped to England, but his estates were confiscated. Returning after Richelieu's death, he entered into the intrigues of the period just preceding the Fronde, and was imprisoned in the Bastille, then in Vincennes, having risked his safety by coming back from exile in Holland to aid the duchess of Chevreuse. Mazarin attempted to win him over in vain, but in 1653 he made his submission to the victorious minister, and from that time on played no part in public life. He had three children by Mlle de Guise, with whom he had a lasting liaison.

His Mémoires have preserved his name from the oblivion otherwise awaiting such intrigues; they are written with naive frankness and are extremely interesting. They are printed by A. Petitot and Monmerque in Collection des mémoires relatifs à l'histoire de France (Paris, 1876).

MONTREUIL, GERBER DE (fl. 13th century), French troubadour, author of the Roman de la violette. He dedicated his poem (c. 1221) to the Countess Marie of Ponthieu, wife of Simon, count of Dammartin and a niece of Philip Augustus. The count Gerard de Nevers of the story stakes his domains on the fidelity of his wife Euriant. Lisiard by calumniating Euriant wins the wager, but in the end the traitor is exposed, and, after many adventures, Euriant is reinstated. Another version of the story is given in the Roman du comte de Poitiers and in the tale in the Decameron (li. 9) in which Shakespeare founded Cymbeline. Lyrics are inserted in the narrative of the Roman de la violette, as they had been in the Conte de la rose (1200), known also as Guillaume de Dole. A prose version, dating from the early 15th century, provided Wilhelmine de Chézy with the material for her libretto of Weber's opera, Euryanthe (1823).

See Hist. litt. de la France, xxii. 782, xviii. 760, xxi. 826; Le comte de Poitiers (ed. F. Michel, 1831); Le Roman de la violette (ed. F. Michel, 1834); Le Conte de la rose (ed. Servois, 1893); F. Kraus, Untersuchungen de Montreuil (1847), Rulof Ohle, Shakespeare's Cymbeline and seine romanischen Vorläufer (Berlin, 1890).

MONTREUIL-SOUS-BOIS, a town of northern France in the department of Seine, 5 m. E. of Paris, on the slope and summit of a hill, about 1 m. N. of Vincennes. Pop. (1906), 15,833. Montreuil is specially noted for its extensive peach orchards. The manufactures include paint, oils and varnish, glass and chemical products.

MONTREUIL-SUR-MER, a town of northern France, capital of an arrondissement in the department of Pas-de-Calais, 24 m. S. by E. of Boulogne by rail. Pop. (1906), 2883. The town with its old citadel and ramparts, due largely to Vauban, is prettily situated on an eminence on the left bank of the Canche 10 m. from the English Channel. The chief buildings are the church of St Sauveur, the Palais de Justice, and the Hôtel de Ville (12th cent.), which was built on land fortified in 1500 and rebuilt in the 19th century, with a fine chapel in the Flamboyant style. The buildings of the old abbey of Ste Austreberthe, founded originally in the 11th century, still remain. Montreuil is the seat of a sub-prefecture and has a tribunal of first instance and a preparatory military school. The town owes its origin to a monastery established in the 7th century by St Sauveur, bishop of Amiens.

MONTREUX, the general name applied to the villages situated along the shore at the east of the Lake of Geneva in Switzerland, from Clarens to Vevey: sometimes the name is specially given to Vevey only. These villages form a part of communes, those of Le Châtelard (including Clarens and Vernex) and of Les Planches (including Territet), while a bit (not Chillon) of that of Vevey is alone included. The total population of this "agglomeration" was 14,144 in 1900, mostly French-speaking, while there were 9730 Protestants to 4301 Romanists and 55 Jews. There are railway stations at Clarens (15 m. south-east of Lausanne), at Vernex (3 m. on), and Territet (1 m. on, or 2 m. from Vevey, which is 24 m. north of Villeneuve), as well as an electric tramway along the shore of the lake, and frequent communication on the Biel-Bienne. From Territet there is a mountain railway past Glion and Caux nearly to the top of the Rochers de Naye (6710 ft.), while from Vevey the Montreux-Bernese Oberland railway mounts past Les Avants, pierces the ridge of the Col de Jaman by a tunnel, and so reaches (14 m.) Montbovon in the Gruyère portion of the upper Sarine valley. At first foreigners were attracted by the cheapness and good air of the region, added to the grape cure. As the delights of clear, cold weather in winter and of tobogganing (here called "lugging") and skiing became appreciated, the higher hotels (such as Les Avants, Caux, Glion) were frequented at that season, as well as at other times. It is stated that in 1902, 1,374 foreigners (in 1903, 39,453) visited Montreux, 7634 being Germans, 7387 English, and 5651 French. Montreux was not a Roman settlement, but otherwise its history is similar to that of Vevey.

MONTRODON, CASIMIR, COMTE DE (1768–1843), French diplomatic agent, was the son of a military officer; his mother, Angélique Marie d'Arlus, comtesse de Montrond (d. 1827), was a royalist writer, said to be the author of the Troubadour bérarnois, which has the refrain "Le clos de Henri, Est prisonnier dans Paris." Casimir was imprisoned in 1794 in St Lazare, where he met the divorced duchesse de Fleury (née Franquetot de
MONTROSE, MARQUISES OF

Coigny), the "jeune captive" of André Chénier's famous verses. He bought her freedom and his own with 100 lours. They married and crossed to London, but the union proved unhappy, and they were driven on their return to Paris.

Turning to the fashionable world, Casimir de Montrond became famous for his successes. He was the confidant and political agent of Talleyrand, and his inside knowledge of politics enabled him to make a large fortune on the Bourse. In 1809 he was disgraced for some imprudent comments on the imperial system, and exiled from Paris. After spending some time at Antwerp he removed to Spa, where he was on intimate terms with Pauline Borghése, and in 1811 he returned to Antwerp; here he was arrested by Napoleon's orders and sent to the fortress of Ham. After his imprisonment he received permission to reside, under police supervision, at Châlillon-sur-Seine, whence he presently escaped to England. He returned to France at the first Bourbon restoration, and during the Hundred Days was entrusted with a mission to Vienna to convert Talleyrand to Napoleon's interests, to see Metternich and Nesselrode, and to bring back if possible Marie Louise and the king of Rome. The second restoration restored him to his social triumphs, though he was always under police supervision, and on Talleyrand's fall he accompanied him to Valèncy and continued to help with his intrigues. He collected Talleyrand to London in 1832.

Montrond returned to Paris some time before his death in 1843.

"See H. Welschinger, "L'Ami de M. de Talleyrand," in the Revue de Paris (Feb. 1893); Lanzac de Laborie, La Domination française en Belgique (1895); and Amédée Pichot, Souvenirs sur M. de Talleyrand (1870)."

MONTROSE, MARQUISES AND DUKE OF. David Lindsay, 5th earl of Crawford (c. 1440-1495), was created duke of Montrose in 1488 (the first dukedom conferred in Scotland on a person not of royal blood), as a reward for remaining loyal to James III. His son and successor, James (c. 1465-1513), was known as the Good Marquess. The latter refused to vote at the trial of his hereditary enemy the marquess of Argyll in 1561, admitting that he could not act impartially in such a matter; and the two noblemen afterwards became firm friends. The good marquess died in 1569, and was succeeded by his son James, 3rd marquess of Montrose (d. 1684). The 4th marquess, son of the last mentioned, who was also named James (d. 1742), was lord high admiral of Scotland in 1705, and lord president of the council in 1706. He was an ardent supporter of the Hanoverian succession; he also favoured the union of Scotland with England, for his services in regard to which he was created duke of Montrose and marquess of Graham in 1707, becoming in the same year one of the first representative peers of Scotland in the parliament of Great Britain. He was one of the regents of the kingdom on the death of Queen Anne, and was appointed a secretary of state by George I. He took an active part in suppressing the Jacobite rising in 1715, after which he made keeper of the great seal in Scotland. He died in 1742. During his lifetime his son David was raised to the peerage of Great Britain with the title of Earl Graham; and on David's death without issue in 1751, this earldom passed under a special remainder to his brother William (c. 1720-1790), who on his father's death in 1742 succeeded to the dukedom also. William's son James, 3rd duke of Montrose (1755-1836), held office in Pitt's administrations in 1783 and 1804, and in that of the duke of Portland in 1807. He obtained the annulment of the law prohibiting Highlanders from wearing the kilt. He was succeeded by his son James (1799-1874), who held office under the earl of Derby in 1852, and again in 1858 and 1866, and was father of Douglas Beresford Maîse Ronald, 5th duke (b. 1852). In 1853 James Lindsay, 24th earl of Crawford, claimed the title of duke of Montrose on the ground that the patent granted to his ancestor David Lindsay in 1488 (see above) had not been effectively rescinded, but his petition was dismissed by the House of Lords.

MONTROSE, JAMES GRAHAM, MARQUESS OF (1612-1659), was born in 1612, and became 5th earl of Montrose (see above) by his father's death in 1626. He was educated at St. Andrews, and at the age of seventeen married Magdalene Carnegie, daughter of Lord Carnegie (afterwards Earl of Southesk). Not long after the outbreak of the Scottish troubles in 1637 he joined the party of resistance, and was for some time one of its most energetic champions. He had nothing puritanical in his nature, but he shared in the ill-feeling aroused in the Scottish nobility by the political authority given by Charles to the bishops, and by Hamilton's influence with the king, and also in the general indignation at the scheme of imposing upon Scotland a liturgy which had been drawn up at the instigation of the English court and corrected by Archbishop Laud. He signed the Covenant, and was told off to suppress the opposition to the popular cause which arose around Aberdeen and in the country of the Gordons. Three times, in July 1638, and in March and June 1639, Montrose left Aberdeen, where he succeeded in effecting his object, on the second occasion by carrying off the head of the Gordons, the marquess of Huntly, as a prisoner to Edinburgh, though in so doing, for the first and last time in his life, he violated a safe-conduct.

In July 1639, after the signature of the treaty of Berwick, Montrose was one of the Covenanting leaders who visited Charles. This change of policy on his part, frequently ascribed to the fascination of the king's conversation, arose in reality from the nature of his own convictions. He wished to get rid of the bishops, but at the same time he did not want making presbyters masters of the state. His own view was essentially a layman's view of the situation. Taking no account of the real forces of the time, he aimed at an ideal form of society in which the clergy should confine themselves to their spiritual duties, and the king, after being enlightened by open communication with the Scottish nation, should maintain law and order without respect of persons. In the Scottish parliament which met in September, Montrose found himself in opposition to Argyll, who had made himself the representative of the Presbyterian and national party, and of the middle classes. Montrose, on the other hand, was anxious to support the king's authority to bear down on parliament to defeat this object, and offered him the support of a great number of nobles. He failed, because Charles could not even then consent to abandon the bishops, and because no Scottish party of any weight could be formed unless Presbyterianism were established eclesiastically.

Rather than give way, Charles prepared in 1640 to invade Scotland. Montrose was of necessity driven to play something of a double part. In August 1640 he signed the Bond of Cumbernauld as a protest against the "particular and direct practising of a few," in other words, against the ambition of Argyll. But he took his place amongst the defenders of his country, and in the same month he displayed his gallantry in action at the forting of the Tyne at Newburn. After the invasion had been crowned with success, Montrose still continued to cherish his now hopeless policy. On the 27th of May 1641 he was summoned before the Committee of Estates charged with intrigues against Argyll, and on the 11th of June he was imprisoned in Edinburgh Castle. When Charles visited Scotland to give his formal assent to the abolition of Episcopacy, Montrose communicated to him his belief that Hamilton was a traitor. It happened that in the same day he was appointed William's Lord-Lieutenant, and it was then that he raised a new and formidable party against Hamilton and Argyll; but this is in all probability only one of Clarendon's many blunders. (See S. R. Gardiner, Hist. of England, 1603-1642, x. 26). Upon the king's return to England Montrose shared in the amnesty which was tacitly accorded to all Charles's partisans.

For a time Montrose retired, perforce, from public life. After the Civil War began in England (see Great Rebellion) he
MONTROSE—MONT ST MICHEL

constantly pressed Charles to allow him to make a diversion in Scotland. Hamilton’s impracticable policy of keeping Scotland neutral for long stood in the way of Charles’s consent. But in 1644, when a Scottish army entered England to take part against the king, Montrose, now created a marquis, was at last allowed to try what he could do. He set out to invade Scotland with about 1,000 men. But his followers deserted, and he was forced to retreat into England. One of the few engagements at which he was engaged, as mentioned above, was at Alford (Apr. 1645), where he, started on the 18th of August with only two gentlemen to make his way to the Highlands. Highlanders had never before been known to combine together, but Montrose knew that most of the clans detested Argyll, and the clans rallied to his summons. About 2,000 disciplined Irish soldiers had crossed the sea to assist him. In two campaigns, distinguished by rapidity of movement, he met and defeated his opponents in six battles. At Tippemuir and Aberdeen he routed Covenantant levies; at Inverlochy he crushed the Campbells; at Auldearn, Alford and Kilsyth, his victories were obtained over well-led and disciplined armies. At Dundee he extricated his army from the greatest peril, and actually called his men off from the sack that had begun—a feat beyond the power of any other general in Europe. The fiery enthusiasm of the Gordons and other clans often carried the day, but Montrose relied more upon the disciplined infantry which had followed Alastair Macdonald from Ireland. His strategy at Dundee and Inverlochy, his tactics at Aberdeen, Auldearn and Kilsyth furnished models of the military art, but above all his daring and constant marked him out as the greatest soldier of the age excepted. His career of victory was crowned by the great battle of Kilsyth (Aug. 15, 1645). Now Montrose found himself apparently master of Scotland. In the name of the king, who now appointed him lord-lieutenant and captain-general of Scotland, he summoned a parliament to meet at Glasgow on the 20th of October, in which he made a speech to reconcile loyal obedience to the king with the establishment of a non-political Presbyterian clergy. That parliament never met. Charles had been defeated at Naseby on the 14th of June, and Montrose must come to his help if there was to be still a king to proclaim. David Leslie, the best of the Scottish generals, was promptly despatched against Montrose to anticipate the invasion. On the 12th of September he came upon Montrose, deserted by his Highlanders and guarded only by a little group of followers, at Philiphaug. He won an easy victory. Montrose cut his way through to the Highlands; but he failed to organize an army. In September 1646 he embarked for Norway.

Montrose was to appear once more on the stage of Scottish history. In June 1649, burning to revenge the death of the king, he was restored by the exiled Charles II. to the now nominal lieutenancy of Scotland. Charles had himself long before shortly afterwards to disavow his noblest supporter in order to become a king on terms dictated by Argyll and Argyll’s adherents. In March 1650 Montrose landed in the Orkneys to take the command of a small force which he had sent on before him. Crossing to the mainland, he tried in vain to raise the clans, and on the 27th of April he was surprised and routed at Carbisdale in Ross-shire. After wandering for some time he was surrendered by Macleod of Assynt, to whose protection, in ignorance of Montrose’s loyalty, he had entrusted himself. He was brought a prisoner to Edinburgh, and there, in May, was sentenced to death by the parliament. He was hanged on the 21st, with Wishart’s laudatory biography of him put round his neck. To the last he protested that he was a real Covenanter and a loyal subject.

The principal authorities for Montrose’s career are Wishart’s Res gestae, etc. (Amsterdam, 1647); Patrick Gordon’s Short Abridgment of Britaine’s Distemper (Spalding Club); and the comprehensive work of Napier, Memorials of Montrose, is abundantly documented, containing Montrose’s poetry, in which is included his celebrated lyric “My land and love.”

MONTROSE, a royal, municipal, and police burgh and seaport of Forfarshire, Scotland. It is situated 50 m. N.E. of Dundee by the North British railway and is also connected with the Caledonian railway company’s system by a branch to Dutton. Pop. (1901), 12,427. The town occupies a considerable area on a sandy peninsula, and is bounded on the E. by the North Sea, on the N. by the North Esk, on the S. by the South Esk, and on the W. by Montrose Basin, a large depression, about 7 m. in circuit. The reclamation of the Basin has been attempted, but an embankment constructed by Dutch digers for this purpose was demolished in a few hours by a storm. In the mouth of the River Montrose, on the S. side of the Inlet to the South Esk, lies the island of Rosse, or Inchbrayock (pop. 160), which in 1829 was connected with the burgh by means of a suspension bridge 432 ft. long and by a drawbridge with the south bank near the fishing village of Ferryden (pop. 1330). The harbour lies between the suspension bridge and the sea, and is provided with a wet dock. The links form one of the best golf-courses in Scotland and are played over by several clubs. Besides the staple industry of flax-spinning, there are manufactures of linen, canvas, sheeting, starch, soap, chemicals, rope and manures, while iron-founding, tanning and brewing are also carried on. The fisheries are of very considerable importance and the shipping is usually brisk. There is a large trade, especially in timber (the chief import), mainly with Baltic ports and Canada. The parish church is a plain structure, but has a handsome steeple 200 ft. high. The principal buildings include the town-hall, the academy on the links, dating from 1820, though its predecessor belonged to the 16th century; the museum, Dorward’s house of refuge, erected in 1839; the infirmary and the royal asylum at Sunnyside on the outskirts to the north-west. Fanmure barracks are not far from the wet coast. Here, too, the Old Pretender embarked in 1716 for France after the failure of his cause. In 1645 the town threw in its lot with the Hanoverians, a fact which lent zest to the daring capture of the “Hazard” troop of war-off Ferryden, by Captain David Ferrier of Brechin, a thorough-going Jacobite.

MONT ST MICHEL, a rocky islet of western France, off the coast of the department of Manche, some 6 m. N. of Pontorson. Pop. (1900), 238. It forms a towering mass of granite about 3000 ft. in circumference and 165 ft. in height, rising near the mouth of the Couesnon nearly a mile from the shore, to which it is united by a causeway. The fortress-abbey to which the town now stands ever since its original foundation, is situated upon the more precipitous side of the islet towards the north, and west, the higher portion towards the east and south being occupied by houses. A strong machicolated and turreted wall surrounds the rock, running along its base on the south, ascending half-way up the cliff on the north, on which side it stands close to the abbey wall, and again descending on the west. The northern and oldest portion of the ramparts dates from the 13th century; the single gateway by which they are passed on the south and is a good example of the military architecture of the 15th century. The single street of the island curves from the gateway up to the abbey, and is flanked on the left by flights leading to the donjon or châtelet. It is bordered by old houses, among which is one built by Bertrand du Guesclin in 1366, and contains a parish church of the 15th century. The abbey itself consists of an assemblage of buildings in three storeys upon massive foundations around the church, the most important portion, the Merville, extending to the north. The floor of the church, built partly on the rock, partly upon foundations, and, at the east end, over a crypt, is on a level with the uppermost storey of the monastic buildings. To the north of and behind the abbey lies the group of buildings known as the Belles Chaises. It comprises the châtelet (13th century), a square entrance structure strengthened by flanking turrets and machicolation, the adjoining guard-room (13th century) with the salle
The Mervelle (1203–1261) consists of two continuous buildings of three storeys, that on the east containing, one above the other, the hospitaller (suportier), refectory and dormitory, that on the west the cellars, knights' hall (salle des chevaliers) and cloister. Of the apartments, all of the finest Gothic architecture, the choir are the refectory, divided down the centre by columns and lighted by large embrasure windows, and the knights' hall, a superb chamber, the vaulting of which is supported on three rows of cylindrical pillars. The cloister, one of the purest and most graceful works of the 13th century, is surrounded by double lines of slender columns carrying pointed arcades, between which delicate floral designs are carved. The exterior wall of the Mervelle was decorated with a large number of pinnacles and balustrading. That central tower terminates in a Gothic spire surmounted by a gilded bronze statue of St. Michael.

Mont St Michel was a sacred place from the earliest times. In the 8th century an oratory was established there by St Aubert, bishop of Avranches, in obedience to the commands of an apparition of St Michael. The place soon became a noted resort of pilgrims, not only from all parts of France, but also from Great Britain, Ireland and Italy. In 666 Richard I., duke of Normandy, founded in place of the oratory a Benedictine monastery, which in the succeeding century received a considerable share of the spoils of the conquest of England. In 1203 the monastery was burnt by the troops of Philip Augustus, who afterwards furnished large sums for its restoration (La Merveille). St Louis made a pilgrimage to Mont St Michel, and afterwards supplied funds which were spent on the fortifications. A garrison and military governor subordinate to the abbot were also installed. During the last thirty years of the Hundred Years' War the abbey offered a persistent resistance to the English. In 1469 Louis XI. instituted the Order of St. Michel, which held its meetings in the salle des chevaliers. During the Wars of Religion, the monks were several times successful in defending the fortress, which opened its gates to Henry IV. in 1595 after his abjuration.

In 1622 the Benedictine monks of Mont St Michel were replaced by monks of the Congregation of St Maur. In the 18th and 19th centuries the abbey was used as a prison for political offenders, serving this purpose until 1863, when an extensive restoration, begun in 1838, was resumed. The building is the property of the Commission of Historical Monuments, which has carried on the work of restoration with great architectural and antiquarian ability.

Montserrat, or Monserrat, a remarkable mountain and monastery in north-east Spain, 30 m. N.W. of Barcelona. The mountain is of grey conglomerate; its main axis trends from W.N.W. to E.S.E., and its circumference is about 18 m. The loftiest point is the Turó de San Jeronimo, also called Mirador and La Miranda (4070 ft.), which commands a view of the Pyrenees, and the Mediterranean Sea as far as the Balearic Islands. On the east the base of the Montserrat is washed by the river Liobregat. The Montserrat consists of jagged pinnacles and spires (peñascos) rising abruptly from the base of the mass, which is cloven by many ravines, and abound with steep cliffs. The name of Montserrat is derived from the Spanish, the monte serrat poisonous parts of the plant, and is thus named either in allusion to its jagged appearance, like the teeth of a saw, or because it is split, as if sawn by the vast fissure of the Vallec Malo, which extends from north-west to east. This occurred, say the Spanish legends, at the time of the Crucifixion, when the rocks were rent. In medieval German legends, which located here the castle of the Holy Grail, the mountain is called Monsalwatsch, a name analogous to the modern Catalan form Montsagrut "sacred mountain." From Montserrat, a village on the north-east, with a station on the Barcelona-Lérida railway, the monastery can be reached either by the carriage road built in 1857, or by a bridle path opened in 1892. The ascent is also frequently made by a bridle path from the village of Collbató, on the south-west, where there are some interesting caverns.

The monastery stands about 200 ft. above sea-level upon a narrow platform on the edge of the Vallec Malo. It owes its existence to an image of the Virgin, said to have been carved by St Luke, and brought to Barcelona by St Peter in A.D. 30. When the Moors invaded the province in 717 the image was taken to the island of Mallorca, where a hermit was sent to guard it. Only a fragment appears to have already existed, and hidden in a cave. In 880 Gomendar, bishop of Vich, was attracted to the cave by sweet sounds and smells, and there found the image, which he determined to take to Manresa. But at a certain spot on the mountain the image refused to proceed farther; there it was consequently deposited, and a chapel was erected to contain it. Round the chapel a nunnery was built, and in 976 this was enlarged and converted into a second Benedictine convent. The old monastery (monasterio antiguo) is chiefly in ruins. The cloisters, belfry and part of the north aisle were demolished after the 14th century. But in 1392 the new monastery (monasterio actual) was built in Renaissance style under Philip II. (1560–1592); in 1831 it was partially burned, and in 1880 a Romanesque aisle was added. New buildings for the monks were erected under Ferdinand VII. (1784–1833), but left partly unfinished. During the Napoleonic wars (1808–14) it was despoiled of the vast treasures which had accumulated during the middle ages. In 1835, as a result of the Carlist insurrection, the convent was deprived of its estates and the number of monks reduced to about twenty. The monks are largely occupied by the management of a school of sacred music. In 1874 the convent, which by a grant of Pope Benedict XIII. had been an independent abbey since 1416, was made subject to the bishops of Barcelona.

Our Lady of Montserrat, Patrona de Cataluña ("Our Lady of Montserrat, Patron Saint of Catalonia"), is one of the most celebrated images in Spain, and her church is visited annually by more than 60,000 pilgrims. The image is small, black, and carved of wood, but possesses magnificent robes and jewels. In September 1881 it was solemnly crowned by Leo XIII., who sent a crown from Rome for that purpose. As the celebrity and sanctity of Montserrat increased, so did the number of devotees. Ignatius Loyola (1491–1556) laid his sword upon the altar of the Virgin, and dedicated himself to the spreading of this devotion. From Montserrat to begin his new life. Many eminent Spaniards, weary of the world, have retired to this monastery to end their days. Some preferred solitary hermitages perched among the rocks. Of these there are fifteen, each with one of the peaks, and one at the summit of San Jeronimo. They were destroyed by the French, but the ruins of some remain. There are also caves in the mountain, some of which were formerly occupied by monks. The most celebrated of these are the cave of the Virgin, in which the santa imagen remained hidden until found by Gomendar, and the cave of Fray Juan Garin, a notorious sinner, who ended his days in the practice of revolting penances at Montserrat.

Montserrat, an island in the British West Indies, one of the five presidencies in the colony of the Leeward Islands. Pop., mostly negroes (1901), 12,215. It lies 27 m. S.W. of Antigua, in 16° 45' N. and 62° 3' W.; is 11 m. long and 7 m. broad, and has a total area of 323 sq. m. The island is a cluster of rugged volcanic peaks rising from the Caribbean Sea, their summits clothed with forests; the still active Soufrière (3000 ft.) in the south being the highest point. The average temperature is 80° F., the hottest weather being usually tempered by cool sea breezes; the rainfall averages 95 in. per annum. There is a moderate humidity, with British winds from the north-east. The soil is of well drained. The principal products are sugar and raw and concentrated lime-juice. Minerals are also found. Montserrat has a local legislature of six members, nominated by the Crown, and sends representatives to the general legislative council of the colony. Education is compulsory, and the majority of the schools are managed by the Church of England, to which most of the islanders belong; but the Wesleyans and the Roman Catholic church have their own schools.
Catholics also support schools. Plymouth (pop. 1461), the chief town, stands on an open roadstead on the south-west coast.

The island was discovered by Columbus in 1493, who named it after Monserrado, a mountain in Spain. It was colonized by the British under Sir Thomas Warner in 1622, and was taken by the French in 1664. Re-taken by his right in 1668, it continued to be French until 1782, but was again restored in 1784.

**Montt—Manuel** (1800–1880), Chilean statesman, was born on the 5th of September 1800. He had a distinguished career as a scholar, and was introduced into public life during the presidency (1811–1814) of Arico to by Diego Portales. Montt distinguished himself by his courage in the crisis that followed upon Portales' assassination in 1837, though only holding a subordinate post in the government, and afterwards he held several ministerial offices, and during the presidency (1841–1851) of Bulnes he became minister of justice and public instruction, and later of the interior. He was elected president in 1851 and again in 1856, and although the Liberals chafed under his rule, and two revolutions, in 1851 and 1859, took place during his administration, he governed Chile with an energy and wisdom that added the foundation of her material prosperity. He was ably assisted by his minister of the interior Antonio Varas, and it was from the union of the two statesmen that the well-known ultra-conservative faction, the Montt-Varistas, took its name. His presidency was marked by the establishment of railways, telegraphs, and banks. Chartier, and training colleges. On the 5th of January 1861 he became president of the Supreme Court of Justice, a position which he held up to his death on the 29th of September 1880. His son Jorge (b. 1840) was president of Chile in 1891–1896, and a younger son, Pedro (d. 1910), in 1906–1910.

See P. B. Figueiras, Diccionario biográfico de Chile, 1550–1887 (Santiago, 1888); and J. B. Suarez, Rasgos biográficos de hombres notables de Chile (Valparaíso, 1886).

**Montucla, Jean Étienne** (1725–1799), French mathematician, was born at Lyons on the 5th of September 1725. In 1754 he published an amusing work, Recherches sur la quadrature du cercle, and in 1758 the first part of his great work, Histoire des mathématiques, the first history of mathematics worthy of the name. He was appointed intendant-secretary of Grenoble in 1758, secretary to the expedition for colonizing Cayenne in 1764, and "premier commissaire des bâtiments" and censor-royal for mathematical books in 1765. The Revolution deprived him of his income and left him in great destitution. The offer in 1795 of a mathematical chair in one of the schools of Paris was declined on account of his infirm health, and he was still in strained circumstances in 1798, when he published a second edition of the first part of his history. On re-editing his book he re-edited Jacques Ozanam's Récitations mathématiques, afterwards published in English by Charles Hutton (4 vols., London, 1803). He died on the 18th of December 1799. His Histoire was completed by J. J. Le F. de Lalande, and published at Paris in 1799–1802 (4 vols.).

**Montyon, Antoine Jean Baptisté Robert Augé**

Baron de (1733–1826), French philanthropist, was born in Paris on the 23rd of December 1733. His father was a maître des comptes; he was educated for the law, and became advocate at the Châtelet in 1755, and attorney-at-law in 1760, and intendant successively of Auvergne, Provence and La Rochelle. He had repeatedly shown great independence of character, protesting against the accusation of Caradeuc de la Chalotais in 1766, and refusing in 1771 to suppress the local courts of justice in obedience to Maupoue. He was made a councillor of state in 1775 by the influence of Louis de Bourbon, duke of Penthièvre, and in 1780 he was attached to the court in the honorary office of chancellor to the comte d'Arois (afterwards Charles X). He followed the princes into exile, and lived for some years in London. During the emigration period he spent large sums on the alleviation of the poverty of his fellow immigrants, returning to France only at the second restoration. Between 1780 and 1787 he had founded a series of prizes, the awards to be made by the French academy and the academies of science and medicine. These prizes fell into abeyance during the revolutionary period, but were re-established in 1815. Montyon died on the 29th of December 1826, bequeathing 10,000 francs for the perpetual endowment of each of the following prizes: for the discovery of the means of rendering some mechanical process less dangerous to the workman; for the perfecting of any technical improvement in a mechanical process; for the book which during the year rendered the greatest service to humanity; the "prix de vertu" for the most courageous act on the part of a poor Frenchman—the awards being left as before to the learned academies. He also left 10,000 francs to each of the Parisian hospitals.

"Montyon wrote a series of works, chiefly on political economy: Éloge de Michelet de l'hôpital (Paris, 1777); Recherches et considérations sur la population de la France (1778), a share of which is attributed to his secretary, Moheau; Rapport fait à l'Assemblée générale (Constance, 1796), in which he maintained in opposition to Calone's Tableau de l'Europe that France had always possessed a constitution, which had, however, been violated by the kings of France; D'État statistique du Tunkin (1811); and Particularités . . . sur les ministres des finances en France (1812).

See Lactelle, "Discurso sobre M. Montyon," in the Recueil de l'académie (1820–1829); Quéré, La France littéraire, vol. vi. (1834); and, further, F. Labour, M. de Montyon après des documents inédits (Paris, 1880); G. Dumoulin, Montyon (Paris, 1884); and especially L. Guinlaud, Augé de Montyon (1909).

**Monument** (Lat. monumentum or monumentum; from monere, to advise, bring to mind, remind; the German equivalent is Monuments). The word "monument" is used of all survivals of a past age, in which sense it may include all the vestiges of prehistoric man, dolmens, menhirs, remains of lake-dwellings, stone-circles, and the like, buildings large and small, cities, castles, palaces, and examples of domestic architecture, which have any interest, historic or artistic, as well as movable artistic or archaeological treasures, which exist in private or public collections, or which are discovered by excavation, &c. In a more restricted sense the word "monument" is also applied to a comprehensive treatise on any particular subject—such as the Monuments typographica, or an historical collection such as the Monuments Germaniae historica. In the English law of conveying a property, "monument" denotes the memory, whether natural or artificial, and referred to in a document, and used as evidence for the delineation of boundaries or the situation of a particular plot of land, &c.

For a description of various kinds of monuments see such articles as Archaeology; Stone Monuments; Effigies, Monumentum; Brasses; Sculpture; many particular monuments, such as Stonehenge, are treated under their respective names, or in the articles on the towns, &c., in which they stand.

The present article deals with the preservation, by government agency, or otherwise, of the memory of remains of past history and civilization, and, incidentally, with similar action extended to sites and places of natural beauty and interest, which the Germans call Naturdenkämmer, natural monuments. The important work of G. Baldwin Brown, The Care of Ancient Monuments, published in 1905, is practically the only book in English on this subject. It contains a most ample bibliography for each country and gives many references to various periodicals in different languages. In 1807 was issued a report (C. 8442, Miscell. Reporis, 2) from British representatives abroad as to the statutory provisions existing in foreign countries for the preservation of historical buildings. A Reference also should be made to The Care of Natural Monuments (1909), by H. Convents, Prussian State Commissioner for the Care of Natural Monuments.

The chief question at issue is, how far does the national
artistic or historic interest of a monument, in the widest sense of the word, justify the interference of the state with the right of a private owner, whether corporate body or individual, to do what he likes with his own? Nearly every European country other than the United Kingdom has given a decided answer to this question. It may be noticed, as showing the extreme reluctance to state interference in the United Kingdom, that a clause, laying on an owner of a monument, scheduled under the Monument Act 1882, the obligation of offering it for purchase to the state if he wished to destroy it, was struck out of that act.

The act is followed by legislation or regulation for the preservation of monuments may be briefly indicated. Central organizations of commissions and conservators, with a staff of architects, inspectors, and archaeological or artistic experts for consultation, are established. These may have large legal powers of enforcing their decisions, or may act chiefly by advice or persuasion. The national treasures are catalogued and scheduled, and the value estimated in an exhaustive inventory, in many cases supplemented by local inventories. In many cases, unfortunately, a valuable monument has been destroyed through ignorance of its value. A special form of inventory, carrying with it the obligation of the owner to build one that the Irish Church has decided that such measures have not been exercised by the first commissioner of works. The act also gave the powers of the act of 1892 to county councils, allowed the authorities, local or central, to make arrangements for the preservation of monuments with owners or others, including societies, and to receive subscriptions for the same object, and also provided for public access to such monuments as are in the guardianship of the commissioners under the act. The acts of 1892 and 1906, though allowing buildings of historic or other interest to be placed under the care of the commissioners, exclude buildings occupied as a dwelling-place by any person other than a caretaker and his family. The act of 1910 gives to the commissioners of works power to acquire by bequest buildings of historic or architectural interest. The act of 1906 had given power to acquire such by gift or purchase, and the act of 1882 had given power by bequest also, but only referred to prehistoric remains. The London County Council possesses powers of purchasing by agreement any building of historic or other interest under a General Powers Act of 1898, and exercised these in 1900 by purchasing a 17th century house in Fleet Street (known as Cardinal Walesey's palace). It will be seen that the United Kingdom possesses no official commission, no conservators, no consultative official body, and no compulsory powers of expropriation. The acts dealing with the subject are entirely permissive. Towards the making of a national inventory the first step taken was the appointment in 1908 of three royal commissions, for England, Scotland and Wales respectively, "to make an inventory of the ancient and historical monuments and constructions connected with or illustrative of the contemporary culture, civilization and conditions of life of the people from the earliest times"; to the year 1700 in the case of England; 1707 in that of Scotland; for Wales no date is specified; and "to specify those which seem worthy of preservation." The Housing, Town Planning, &c. Act 1909, §45, and the Development and Road Improvement Funds Act, 1909, excepts the sites of ancient monuments or of other objects of historical interest from compulsory acquisition for the purposes of those acts. The Finance Act 1896, §26, granted a qualified exemption from estate duty to pictures, prints, books, MSS., works of art, scientific collections and other things not yielding income, as appear to the Treasury to be of national, scientific or historic interest; this exemption only extends to buildings or other monuments of works, who are then responsible for its preservation and can protect it even against the owner. The commissioners may purchase any of the scheduled monuments, but only by agreement, the compulsory clauses of the Lands Clauses Consolidation Acts being expressly excluded, though any purchase is to be made under those acts. An owner of any monument other than those scheduled may place it in the care of the commissioners. The funds for the working of the act are to be provided by parliament, and an inspector of ancient monuments was appointed. General Pitt-Rivers, the first inspector appointed, found that without compulsory powers the act was useless, and for many years did not draw his official salary. After his death in 1910 the office was left unfilled until 1916. The act of 1892 applied to Ireland only, and is supplementary to that of 1882, which applied to the whole of the United Kingdom. The Irish act gave to the commissioners of public works in Ireland powers—only to be exercised with the consent of the owner—to apply the act of 1882 to any monument possessing such public interest as might render it worthy of preservation. It is to be noticed that after the disestablishment of the Irish Church certain unused churches of artistic or historic interest were placed in the charge of the commissioners as national monuments, with a sum of £50,000 to defray expenses. The Irish commissioners have therefore monuments in their care other than those scheduled in the acts, and may apply towards the expenses of the preservation of the scheduled monuments any surplus over from the fund above mentioned. The act of 1892 makes the Irish commissioners the custodians of such monuments as have been declared to be national monuments. The act also gave the powers of the act of 1892 to county councils, allowed the authorities, local or central, to make arrangements for the preservation of monuments with owners or others, including societies, and to receive subscriptions for the same object, and also provided for public access to such monuments as are in the guardianship of the commissioners under the act. The acts of 1892 and 1906, though allowing buildings of historic or other interest to be placed under the care of the commissioners, exclude buildings occupied as a dwelling-place by any person other than a caretaker and his family. The act of 1910 gives to the commissioners of works power to acquire by bequest buildings of historic or architectural interest. The act of 1906 had given power to acquire such by gift or purchase, and the act of 1882 had given power by bequest also, but only referred to prehistoric remains. The London County Council possesses powers of purchasing by agreement any building of historic or other interest under a General Powers Act of 1898, and exercised these in 1900 by purchasing a 17th century house in Fleet Street (known as Cardinal Walesey's palace). It will be seen that the United Kingdom possesses no official commission, no conservators, no consultative official body, and no compulsory powers of expropriation. The acts dealing with the subject are entirely permissive. Towards the making of a national inventory the first step taken was the appointment in 1908 of three royal commissions, for England, Scotland and Wales respectively, "to make an inventory of the ancient and historical monuments and constructions connected with or illustrative of the contemporary culture, civilization and conditions of life of the people from the earliest times"; to the year 1700 in the case of England; 1707 in that of Scotland; for Wales no date is specified; and "to specify those which seem worthy of preservation." The Housing, Town Planning, &c. Act 1909, §45, and the Development and Road Improvement Funds Act, 1909, excepts the sites of ancient monuments or of other objects of historical interest from compulsory acquisition for the purposes of those acts. The Finance Act 1896, §26, granted a qualified exemption from estate duty to pictures, prints, books, MSS., works of art, scientific collections and other things not yielding income, as appear to the Treasury to be of national, scientific or historic interest; this exemption only extends to buildings or other monuments of works, who are then responsible for its preservation and can protect it even against the owner. The commissioners may purchase any of the scheduled monuments, but only by agreement, the compulsory clauses of the Lands Clauses Consolidation Acts being expressly excluded, though any purchase is to be made under those acts. An owner of any monument other

1 The names of the monuments so scheduled are given in an appendix to Sir R. Hunter's Lecture on the Preservation of Places of Interest and Beauty (1907).
societies, whose proceedings contain invaluable accounts of practically every monument of interest throughout the kingdom, there are two societies directly formed with the object of monument preservation in its widest sense, the Society for the Protection of Ancient Buildings, founded in 1877, and the National Trust for Places of Historic Interest and Ancient Monuments, organized in 1894 under the Joint Stock Companies Act of 1862 for the purchase and preservation of sites and buildings, which it can hold in perpetuity for the benefit of the public. In 1907 the latter was dissolved and re-incorporated as a statutory body by the National Trust Act 1907. It possesses twenty-eight properties, amounting to 2000 acres, and twelve interesting buildings.

India.—The Archaeological Survey of Upper India was established in 1862, with a director-general at its head, and surveys for other parts of India were also begun later. The chief object of these was the making of an inventory, and the preservation of the monuments was neglected. In 1878 a curator of ancient monuments was appointed. A period of activity with regard to monument preservation set in during the viceroyalty of Lord Curzon; this culminated in the Ancient Monuments Preservation Act of 1904. The main provisions are as follows: The local government of any province may declare any monument to be a "protected monument within the meaning of the act," and when so declared no one may injure, remove or alter it under penalty of a fine or imprisonment. This, however, only applies to the owner, except when the government has, by purchase or gift, or by taking over the guardianship of the monument, assumed the duty of preserving it. This assumption of guardianship is by agreement with the owner. Power of expropriation under the Land Acquisition Act 1894 is given if a monument protected under the act is threatened with destruction or injury, or if an owner refuses to come to an agreement with the authority for its guardianship. The act includes movable antiquities, and the governor-general in council can prohibit their exportation. Control over excavations is also exercised.

Egypt.—A Commission of Egyptology (Comité permanent d'archtologie) has the care of the monuments of early Egyptian civilization. The monuments of the Arab occupation are in the charge of a separate commission (Comité de conservation des monuments de l'art arabe). The Commission of Egyptology acts under khalidial decrees of 1883, 1897 and 1891. By the first the state claims control over all antiquities and declares the contents of the Giza (Gizeh) Museum, now the National Museum of Egyptian Antiquities, and of any future collection, to be the property of the state and inalienable. The second decree penalizes injury to monuments or attempts to appropriate a monument belonging to the state. The third deals with excavations; permission must be granted by the director-general of museums; objects discovered belong to the state and must go to the museum, but a part of the objects will be granted to the discoverer under special regulations, the government reserving the right to special objects with compensation for the expense of excavation.

France.—The Commission des monuments historiques was established in 1837. It is attached to and acts through the department of the minister of public instruction and of Fine Arts, who is the president of the commission. There are thirty members, partly nominated by the minister out of names selected by the commission, partly ex officio, such as the directors of civil buildings and national palaces and of public worship. The buildings which these officials control are, however, not directly under the commission. The presence of a certain number of deputies on the commission secures its representation in the legislature. Upon the commission fall the following duties: (a) The classement or selection of the monuments of national interest, artistic, historic, or both, for the schedule of protected monuments. A particular portion of a building, such as a door, window, &c., may be alone protected. (b) The restoration and repair of the monuments so classed. (c) A general power of giving advice and watching the monuments of the country as a whole. The commission has the charge of the Musée Cluny, and is also the centre for all inquiries, reports, &c. The official staff of the commission consists of four general inspectors, one of whom, since the Monument Act of 1887, has charge of the movable monuments, and of forty architects, who have a subordinate staff of inspectors of works. Since 1850 a sum has been voted yearly for the financial needs of the commission. The largest sum (130,000) that has appeared in the budget was voted in 1896; there are, however, other sources of revenue available. The Monument Act of 1887.—This, together with certain administrative decrees, gave legal powers to the commission, which it had hitherto lacked, or had only been able to enforce by a difficult process of expropriation if owners, whether private or public, of monuments classés objected to the work of the commission. If a monument classé belong to the state or is under the administration of a minister other than the minister of public instruction and fine arts, or if it belong to any public body, such as a department or commune in whose hands the churches mainly lie, the consent of these controlling bodies must be given, otherwise the decision is left to the conseil d'état. If the owner be a private person, his consent is also necessary to the classement. If he refuses, the minister may expropriate the monument by compulsory purchase, which must have the consent of the conseil d'état. Once a monument has been classé, it cannot be destroyed even partially, and no repairs or other work can be effected upon it without the consent of the minister. An action for damages only lies against a person infringing the law in this respect. The act deals also with the classement and protection of movable objects of national interest, historic or artistic, but only if they belong to the state, when they cannot be alienated, or to public bodies, when the consent of the minister is required for repairs or alienation. The act does not affect moveables belonging to private persons. Owing to the numerous thefts from churches, museums, and other places, which attracted particular attention in 1907, proposals have been made for the better protection of such objects, as well as of those in private collections, by gathering together the objects at present scattered in churches, &c., into provincial and local museums, and also by charging an entrance fee for museums, &c. With regard to the discovery of monuments by excavation works or accident, the minister must receive immediate notice from the mayor of the commune through the prefect of the department, and will decide what is to be done. If such discovery is on private property he may proceed to expropriation. The act applies to Algeria. Here all objects of archaeological or artistic interest are reserved to the state, if on ground belonging to the government or granted by it to public bodies or private persons or in military occupation. The precaution was all the more necessary, as the law has more stringent regulations; for by a decree of the bey, 1886, the consent of the owner to the classement of a monument is not required, and penalties under the French penal code attach to infringements.

There is a strong feeling in France as to the protection and preservation of sites of natural beauty. A Société pour la protection des paysages was founded in 1901, and in 1904 the minister of public works issued a circular to the government engineers emphasizing the obligation of preserving and, if possible, enhancing the beauty and grace of the landscape and the works being carried out. An act (Loi organisant la protection des sites et monuments naturels de caractère artistique) was adopted in 1906, extending a protection to such sites analogous to that under the Monument Act (Appendix B in Sir R. Hunter's Lecture, already cited, gives the regulations under this measure). A law of 1910 prohibits the affixing of bills or advertisements on monuments and sites officially recognized as historical and in sites recognized as picturesque by the law of 1906. The prefect also fixes a zone near such sites or monuments within which advertisements or signs are prohibited.

Societies, both national and local, are numerous and active in France, but the centralizing policy does not favour any close working with the commission. The most important are the Société nationale des antiquaires de France, founded in 1804, and the Société française d'archéologie pour la conservation et
description des monuments historiques, founded in 1834, by the archaeologist Arcisse de Caumont (1862-1873). Its publication, the Bulletin monumental, is extremely valuable. In 1887 was founded the Comité des monuments français, which confines itself more particularly to the practical side of monument preservation and protection, and publishes an illustrated periodical, L'Ami des monuments. Of the numerous local societies the semi-official Commission du vieux Paris and the private Société des amis des monuments parisiens and the Commission municipale du vieux Lyon may be mentioned.

Germany. Legislation and administration with regard to monuments and their protection are not imperial, but are matters for the various states. Of these Hesse-Darmstadt alone has a Monument Act (1902), but in nearly all the states the system adopted for monument preservation and protection has been the appointment of conservators (Denkmalspfleger), with commissions attached, and a careful system of inventory. There are also many in the states decrees and administrative orders. In Prussia provincial conservators and commissions, appointed in 1891, assist the central conservator. The general absence of special legislation leaves private owners of monuments absolutely free, as long as there is no press for public opinion. The official and legal control exercised by the conservators and commissions is restricted to those monuments which belong to the state. The wide powers, however, given to local and municipal authorities in Germany, enable much to be done without state legislation. Many towns have powers to make by-laws regulating building and street-planning with a view not only of the preservation of the actual monuments but also of what is known as Städtekultur, the characteristic appearance given to a town by its ancient buildings, walls, gateways, &c.

The regulations of many of the Bavarian towns are excellent examples of what can be done in this way.

The final control of the monuments of Hesse-Darmstadt is in the hands of the minister of the interior, who presides over a Denkmalrat, or council on monuments, consisting of owners of historical monuments, members of societies interested in such objects, and representatives of the Catholic and Protestant Churches. There is also a general conservator. The act protects Naturdenkmäler, such as water-courses, rocks, and even trees. No excavations can be carried on without permission, and all finds must be reported to the local authority.

The principal German society is the Gesellschaft der deutschen Geschichts- und Altertumsverein, founded in 1852. This is a general association of all the various societies throughout Germany. There are also many societies in the various towns, as well as local associations more directly concerned with the practical protection and preservation of monuments. The chief periodical—perhaps the most important of any dealing with the subject in Europe—is Die Denkmaltäfgefe, published first in 1899. It is connected with the society known as Heimatbund, the "defence of home."

Italy.—There is a long history of monument regulation, dating back to a provision against the destruction of monuments in the statutes of the city of Rome of the 14th century and to the appointment of Raphael by Leo X. as controller of the city's monuments. Throughout the various states of Italy during the 17th, 18th and 19th centuries till the unification of the kingdom, stringent regulations by decree or statute were in force to preserve the relics of the past in which the country is so peculiarly rich. Mariotti (La Legislazione delle belle arti, 1862) gives a full account of many of these regulations. It must suffice here to mention the Decreto Parietale of 1802 and the Piazza Edict of 1829, named after the two Cardinal-Camerlenghi subscribing the same. It was not until 1902 that an act was passed for the whole of Italy. This act, with a supplementary act of 1903, and the code of regulations (Regolamento) of 1904, has been superseded by the acts of 1897 and 1909 and the Regolamento of 1910, which constitute the whole body of the provisions in force for the protection of monuments. The minister of public instruction is the final authority, and under him the director-general of antiquities and fine arts.

The Superior Council of Antiquities and Fine Arts, created by the law of 1907, consists of 21 members; it is divided into three sections of 7 members each for antiquities, medieval and modern art, and contemporary art respectively. All the members of each are nominated by royal decree, and so are three members of the third, being elected, one by the architects, one by the sculptors, and one by the painters of Italy. This is an advisory body. The minister presides, and the director-general can be present and has a vote. The administrative organization under the director-general consists of the divisional superintendencies (each having a group of provinces under it) divided into three ranks: (a) 18 superintendencies of monuments preservation, administration, and surveillance of monuments even in private hands; (b) 14 superintendencies of archaeological excavations and museums (with control of objects in private hands and of the offices for exportation); (c) 15 superintendencies of galleries, medieval and modern museums and objects of art. Under each superintendency is a staff of directors of monuments, museums and galleries, of inspectors, architects, custodians, &c.

The nominations to the superior grades are by competition. There are offices for the examination of objects before exportation, and the transfer from the towns registries to the registries of the monuments or a director of a gallery or a museum in which it is necessary. The official organizations are assisted by (a) honorary inspectors, nominated by royal decree in any commune or circoscardio where it may seem advisable; (b) provincial commissions, meeting in the chief town of each province, composed of not less than 7 members, nominated by royal decree, and including of right the superintendents, and meeting normally twice a year.

The monuments within the purview of the act of 1909 and its administration comprise all movable (including MSS., incunabula, rare engravings and coins) and immovable objects of historical, archaeological, palaeo-ethnological or artistic value and interest, so long as they are not less than fifty years old or not the work of living persons. Such objects, if they belong to the state, a province, a commune, a religious corporation or any recognized corporation (ente morale), cannot be parted with at all, except as from one such body to another, and this only with the leave of the ministry; and the authorities of such bodies must present to the ministry an inventory of such objects. Nor may repairs or alterations be made to them without the consent of the minister, which has the right to interfere by regulations (such as, e.g., the prohibition of the use of tapers, &c., which are liable to damage a picture) for the preservation and restoration (and in extreme cases even the removal) of such objects, if necessary, the latter being at the expense of the body to which they belong in so far as it can afford it. Any private person owning or possessing any object falling under the law, the importance and interest of which has been notified to him as the regulations provide, cannot transfer his property in or abandon his possession of it without informing the ministry, which has the right of pre-emption within two months (or four in case of financial pressure owing to many simultaneous offers) at the price for which he has contracted to sell it; and, if it is subject to damage and the proprietor will not provide for its repair, it may be expropriated by the state, by a province or commune—or even by bodies which have legal personality and aim at the preservation of such objects for the public enjoyment. It has not yet been possible, however, to secure the right of search nor of public access; so long as an object is well kept up by the owner, he may refuse the right of access except to the officials.

The act of 1909 is a partial act, and the officials of importance is forbidden, even if their importance has not been notified to the owner, who is under the obligation to advise the government of his intention to export it, having the right of pre-emption within two or four months, as the case may be; and even if the government does not purchase the object, it may still return it to the proprietor, forbidding him to export it. The objects exported are subject to a progressive tax, with a maximum of 20%. Objects temporarily imported from foreign countries, and re-exported within five years, are not subject to tax. Temporary exportation, if
MONUMENT

permitted, is allowed on deposit of the tax; and if objects of importance are allowed to be sent from one part of Italy to another (especially to the islands), this is done by the government at the owner’s expense.

As to excavations, in every case application to excavate must be made to the minister, who has a general supervision over the work and may stop any operation if such monuments are too far. The excavation can only be on private ground, but pays compensation; and can expropriate ground on which it wishes to excavate or on which discoveries have been made, the “archaeological value” not being reckoned. As to finds, if the state conducts the excavation, the owner retains one-fourth of the value or of the objects discovered at the choice of the state, the rest belongs to the state. In other cases, and in the case of chance discoveries (notice of which must be given immediately), the state takes one-half, if the excavation is conducted by public institutions or persons, then the discoveries must be given to a public museum, or if part is handed over to the finder, it must be kept in such a way as to be accessible to the Italian public. The ministry gives periodical reports of all work carried out by the authorities in the Notizie degli Scavi and the Bollettino d’arte, both of which appear every month. The funds at the disposal of the ministry for purchases include (a) a sum of £40,000 already invested, (b) the interest upon £100,000 rentes regularly paid in, (c) other sums from sales of publications, fines, &c.; (d) an annual credit voted in the budget (£12,000 in 1909–1910), forming an account called the monument fund.

The regulations issued in 1910 for the execution of the new law consist of some 200 articles in three divisions—one dealing with the artistic and historical patrimony of Italy and its internal administration, a second with the question of exportation, and the third with financial matters. (T. As.)

Greece.—The earliest regulations are those contained in the law of 1857, promulgated by royal decree. This has been replaced by the Monument Act of 1890, but the principles of the earlier law remain, and the later act still lays down “the most extensive claim that any state has ever put forward in the matter of monuments,” viz. that “all objects of antiquity in Greece, as the productions of the ancestors of the Hellenic people, are regarded as the common national possession of all Hellenes.” The department in charge of the administration of the act is that of the minister of religion and public instruction. There is a central commission working with local commissions and a body of conservators. The control of this executive is in the hands of the epheb-general of antiquities. The act protects medieval monuments as well as those of classical Greece. All immovable monuments are public property, but compensation is to be paid to private owners. The work of preserving and preserving movable antiquities, if worthy of preservation by the state, must be placed in public museums. If discovered on private property the owner receives half the value, and may keep those not removed to a museum; all, however, must be registered. Excavations can be made anywhere by the state, and permission for private work must be first obtained. Expropriation is allowed. The export of antiquities is strictly forbidden under severe penalties, and the infringement of the various provisions of the act can be punished by heavy fines or imprisonment.

Austria-Hungary.—There is no legislation for the empire as a whole. In Austria there is a central commission, established 1850, whose authority is regulated by rescripts of 1873 and 1899 of the minister of religion and education. It consists of twenty members selected from experts in history, art and archaeology; there is also a numerous body of conservators who have districts covering the country assigned to them. They have no executive powers, but report on all new works likely to injure monuments, make inventories, influence public opinion, and work with archaeological societies for the general protection of ancient monuments. Hungary, on the other hand, has a Monument Act of 1881. With regard to any existing monument, the minister of religion and education decides whether it is worth preserving. Then the owner, whether public or private, must preserve it at his own cost. If that is impossible the minister may expropriate it. Compulsory purchase may also be resorted to for the purpose of excavation.

Belgium.—There is no monument legislation, but there is a royal commission, resembling that of Austria, founded in 1835, and a royal decree of 1840. The successful preservation of works contained in churches or alienation or reconstruction of churches without state permission. An inventory has been in progress since 1861, and the commission publishes a Bulletin. By a communal law of 1836 local administrations have to submit proposals for the destruction or repair of monuments to the committee of the provincial council, and must obtain royal approval. Expropriation on the ground of public utility may be resorted to for the protection of a threatened monument in the hands of a private owner.

Holland.—A state commission (Rijkscommissie) was established in 1903, and began an inventory of all monuments, movable and immovable. Any proposed alteration or demolition of buildings of interest in a town must be reported by the burgomaster to the minister of the interior. The annual budget of the minister of the interior contains sums to be allotted for the repair of specified monuments.

Switzerland.—Legislation is in the hands of the cantons; Vaud, Neuchâtel and Bern have passed Monument Acts, modelled on that of France. The federal government may allot an annual grant for the acquisition and upkeep of national monuments and for excavations. There is a federal commission, established in 1886, whose functions, mainly those of other countries, are exercised by the Swiss Society for the Preservation of Monuments of Historical Art.

The preservation of scenery and of natural monuments is considered a matter of great importance, and in 1905 was founded a Swiss society which has a branch in the United Kingdom, La Ligue pour la conservation de la Suisse pittoresque—Die schweizerische Vereinigung für Heimatschutz. The special object of the society is the prevention of the defacement of Alpine scenery by funicular and other railways, mountain-lifts, power-stations, &c. It was successful in protecting the falls of the Rhine at Schaffhausen from a Zurich electric-power scheme.

Denmark.—The means adopted are an excellent example of what can be done without legislation by appeals made by a central authority working with expert knowledge to an enlightened public opinion and to national sentiment. The authority consists of an inspector of ancient monuments and the directorate of the Museum of Northern Antiquities at Copenhagen, exercising the functions of a royal commission that was established in 1867 and which is of course the most powerful of its kind in the world. The removal of antiquities is also due to an old law, modified by royal decrees of 1757 and 1752, by which all finds of gold, silver and precious objects belong to the state, and to a declaration of 1848 that all monuments on the Crown domains are national property and are to be specially preserved in case of sale. Many private owners have followed the example of the Crown. G. Baldwin Brown (op. cit. p. 188 seq.) gives some interesting examples of the success of the directorate of the museum in preserving monuments by appeals to ecclesiastical owners, projectors of railways and other works, and other associations.

Sweden.—There is a state antiquary (Riksantikvar), appointed first by Gustavus Adolphus; the functions of a commission are exercised by the Royal Academy of Science, History and Antiquities, founded in 1786. There is an elaborate and stringent code of regulations protecting monuments, contained in royal decrees of 1867, 1873 and 1886. These are based on the edict of Charles XI. (1666), declaring all ancient monuments under royal protection. Sweden possesses one of the fullest inventories contained in the antiquarian topographical archives.

Norway.—Here there is also a state antiquary, and a state-subsidized society, Foreningen til norske Fortidsmindeforvaltning, founded in 1844, which acts much as a commission, and advises the state official.

Russia.—The care of ancient monuments is in the charge
MONVEL—MONZONITE

of the ministry of the imperial court, of which the Imperial Archaeological Commission, founded in 1850, is a department. The Imperial Academy of Fine Arts is joined in this charge with the commission, whose duties resemble in the main those of the commissions of other countries. By a circular of 1901 a complete inventory of the monuments of the country was ordered to be made by the local authorities.

Spain.—A monument commission was established in 1844; it works under regulations issued in 1865. It is composed of the Royal Academies of Fine Arts and of History, corresponding members of which form commissions for the provinces of the kingdom. A complete inventory of all monuments is being made. The director in charge is that of public instruction and of the fine arts.

Portugal.—A decree of John V. (1721) protected the monuments of ancient times; in 1830 this protection was extended to medieval monuments. An inventory was begun in 1841. A council of national monuments was established in 1901 by a royal decree, with a code of regulations. The French system of classement is adopted, and the regulations under the French act of 1887 are generally followed. The minister responsible is that of public works, commerce and industry.

Ohio.—The law of 1855 is considered an irade of 1884, are very stringent, and the principle adopted is that of Greece, that all objects of antiquity belong to the state. The private owner of such has no power of disposition, and must not injure nor destroy them. All excavations are under the control of the government, and permission must be first obtained. The exportation of finds is forbidden, and all movable discovered belong to the Imperial Museum. If these finds are the result of excavations, one-twentieth of the value goes to the discoverer; if of accidental discovery, the owner of the soil and the state divide.

United States.—With regard to the remains of prehistoric man, earthworks, barrows, &c., some of those states, such as Ohio, which are specially rich in such monuments, have particular laws protecting individual remains, e.g. the earthworks in Warren county. The state exercises control over other remains of interest, e.g. the Eagle earthworks in Licking county. There is also an archaeological and historical society, partly maintained by the state, with the object of the better preservation of the evidences of the prehistoric occupation. In North Dakota a state historical commission was created in 1895 "to collect and preserve the records and relics pertaining to the state."

The sites of the battle-fields, and statues, &c., erected in commemoration of the War of Independence or the Civil War, are preserved by various methods—by state or municipal regulations, by the action of incorporated bodies or trustees, &c. Most of the states rely on statutory prohibitions of malicious damage to protect their monuments and old buildings, &c.

MONVEL (1745-1812), French actor and dramatic writer, whose real name was Jacques Marie Boutet, was born in Luneville on the 25th of March 1745. He was a small, thin man without good looks or voice, and yet he became one of the greatest comedians of his time. After some years of apprenticeship in the provinces, he made his début in 1770 at the Comédie Française in Médoro and Zénolide; he was received sociétaire in 1772. For some reason unknown Monvel secretly left Paris for Sweden about 1781, and became reader to the king, a post which he held for several years. At the Revolution he returned to Paris, embraced its principles with ardour, and in 1791 joined the theatre in the rue Richelieu (the rival of the Comédie Française), which, under Talma, with Dugazon, and of all the admirers of Grand-Guignol and Molière, was soon to become the Théâtre de la République. After the Revolution Monvel returned to the reconstituted Comédie Française with all his old companions, but retired in 1807. Monvel was made a member of the Institute in 1795. He wrote six plays (four performed at the Comédie Française), two comedies, and fifteen comic operas, seven with music by N. Dezède (1740-1792), eight by Nicolas d'Alayrac (1753-1809). He also published an historical novel, Frédégonde et Brunehaut (1776). He was professor of elocution at the Conservatoire. Monvel's two daughters, Miles Mars etude and cédette, were well-known actresses.

MONZA (locally Moncesia), a city of Lombardy, Italy, in the province of Milan, 8 m. by rail N.E. of that city, with which it is also connected by both steam and electric trams. It lies on the Lambro, a tributary of the Po, 532 ft. above sea-level. Pop. (1906), 32,000 (town); 53,330 (commune). Of the medieval fortifications little remains save the Porta d'Agrate. Near it is the nunnery in which the nun of Monza (see Manzoni's Promessi sposi) was enclosed. The cathedral of St John Baptist is one of the principal object of interest; Theodolinda's basilia of Pza was enlarged at the close of the 14th century by throwing the atrium into the main building, and the present fine black-and-white marble façade was erected about the middle of the 14th by Matteo da Campione, and restored in 1899-1901. On the left-hand side of the front rises an incongruous brick-built tower, 278 ft. high, erected by Pellegrini in 1592-1606. Within the church are the iron crown of Lombardy, supposed to have been beaten out of one of the nails used at the Crucifixion, and the treasury containing the relics of Theodolinda, comprising the alpaca fan and diadem, gold and golden hens and seven chickens, representing Lombardy and her seven provinces, and crosses, reliquaries, &c., of the Lombard and Gothic periods. The interior has been modernized; there is a fine relief by Matteo da Campione in the organ-loft, representing the coronation of a king, and some 15th-century frescoes with scenes from the life of Theodolinda. Next to the cathedral in artistic importance come the church of Santa Maria in Istrada, and the broletto or old palace of the commune, usually styled the Arengario; the former (founded in 1357) has a rich terra-cotta façade of 1435, and the latter is raised on a system of pointed arches, and has a tall square tower terminating in machicolations surrounding a sharp central cone. The royal palace of Monza (built in 1777 for the archduke Ferdinand) lies not far from the town on the banks of the Lambro. Cotton goods and felt hats are the staple products of the flourishing Monza industry; then dyeing, organ-building, and a publishing trade.

Monza (anc. Medicia) was not a place of consequence till it attracted the eye of Theodoric; and its first important associations are with Theodolinda. During the period of the republic Monza was sometimes independent, sometimes subject to the Visconti. The Visconti, however, in time made themselves masters of the city, built a castle in 1325 on the site now occupied by the Palazzo Durini. In the course of its history Monza stood thirty-two sieges, and was repeatedly plundered—notably by the forces of Charles V. The countship (1499-1796) was purchased in 1546 by the wealthy banker Durini, and remained in his family till the Revolution. At Monza King Humbert was assassinated on the 29th of July 1900.

MONZONITE, the group-name of a type of rocks which have acquired it from their most celebrated occurrence, that of Monzoni in Tirol. The rocks are of granite appearance, usually rather dark grey in colour and fine to moderately coarse grained. The special characteristic which distinguishes them from granites and ordinary syenites is the presence of plagioclase and orthoclase felspars in nearly equal amounts. Labradorite, andesine and oligoclase are present, usually in well-shaped crystals, often zoned; orthoclase forms large irregular plates in which the other minerals are embedded. There is rarely any considerable amount of quartz, though in a few of these rocks this mineral occurs (the quartz-monzonites). Other features are the abundance of augite, pale green or brownish green, and of large bronze-coloured plates of biotite which are of quite irregular shapes and full of enclosures. Hypersthene or bronzie is less common, but dark brown and green hornblende are sometimes abundant. Olivine also may be present; when the rock contains this in notable quantity it may be called an olivine monzonite. Numerous large prisms of apatite often characterize micro-sections of monzonites, and zircon, iron ores and pyrites are frequent accessory minerals.
The monzonites of Tirol show a great variability in appearance, structure, and the relative proportions of their minerals. They tend to pass into rocks which have been called diabases and gabbros, and near the margins of these stocks or in pyroxene-granulites occur. Many authors believe that this variety of types is associated with the fact that the monzonites occupy a middle class as regards their chemical composition between the acid and the basic igneous rocks, and that such a magma is naturally somewhat unstable, and likely to split up or differentiate into partial magmas of more siliceous and less siliceous character. The monzonites in fact approach rather closely to the calculated mean composition of the outer portion of the earth's crust and from a molten magma of this nature it is natural to suppose that all kinds of igneous rocks have been derived.

Rocks of monzonitic facies occur also in Norway, where they have been described as ákerites. They contain quartz, orthoclase and plagioclase, augite and dark brown biotite; hornblende and hypersthene also may be present. Some of them have porphyritic rather than granitic texture, especially near the margins of the laccolites. From a study of these and other occurrences Brogger proposed to define the monzonites as orthoclase-plagioclase rocks in which the two chief classes of felspar occur in nearly equal quantities (as distinguished from the orthoclase rocks or granites and syenites and the plagioclase rocks or diorites and gabbros).

At Yogo Peak and Barenwars in Montana, U.S.A., there are monzonite-granulite rock which bear close resemblance to the monzonites of Tirol. Two main types occur: (a) yogoite, which differs little from monzonite, and (b) shonkinite, which is a more basic rock. The plagioclase felspar are conspicuous in micro-sections of this rock, and the abundance of olivine is rather greater than is usual in the monzonites; it is associated with diorite of lamprophyric character and dark pyroxenites from a partial fusion.

The following analyses show the chemical peculiarities of the principal rocks of the monzonite group:

MOOD. (1) (O. Eng. mood, a word common to Teutonic languages; cf. Ger. Mut; Du. moed, mind, courage), a particular state of mind or feeling. (2) (Adapted from Lat. modus, measure), a grammatical term for one of the various forms into which the conjugation is grouped, showing whether the verb is used as a predicate, a wish, a command, &c. In syllogistic logic the term is used of the various classes into which the "figures" of valid syllogisms are divided. (See SYLLOGISM.)

MOODKEE, or MUKKI, a town in the Ferozepore district of the Punjab, India. Pop. (1901), 2977. It is situated 26 m. S. of the Sutlej, on the old road from Ferozepore to Karnal, and is notable as the scene of the first battle (Dec. 18, 1845) in the first Sikh war. (See SIKH WARS.)

MOODY, DWIGHT LYMAN (RYTHER) (1837-1890), American evangelist, was born in the village of East Northfield (Northfield township), Massachusetts, on the 5th of February 1837. His father died in 1841, and young Dwight, a mischievous independent boy, got a scanty schooling. In 1854 he became a salesman in a shoe-store in Boston; in 1855 he was "converted" and in 1856 he went to Chicago and started business there. Beginning with a class gathered from the streets, he opened (1859) a Sunday school in North Farwell Hall, which was organized in 1863 as the Illinois Street Church, and afterwards became the Chicago Avenue Church, of which he was layman pastor. In 1860 he gave up business and devoted himself to city missionary work. He was prominent in raising money for Farwell Hall in Chicago (1867), and in 1865-1869 was president of the Chicago Young Men's Christian Association. Ira David Sankey (1840-1908) joined him in Chicago in 1870 and helped him greatly by the singing of hymns; and in a series of notable revival meetings in England (1873-1875, 1881-1884, 1891-1892) and America they carried on their gospel campaign, and became famous for the Moody and Sankey Gospel Hymns. In 1879 Moody opened the Northfield seminary for young women, at Northfield, Mass., and in 1881 the adjacent Mount Hermon school for boys; in each a liberal practical education centre about Bible training; the boys do farm-work and the girls house-work. In 1889 he opened in Chicago the Bible Institute, and there trained Christian workers in Bible study and in practical methods of social reform; at Northfield in 1896 he opened a Training School in domestic science in the Northfield Hotel, formerly used only in summer for visitors at the annual conferences, of which he and Sankey are the Bible (or Christian Workers') Conference, first held at Northfield in 1888, and the Students' (or College Men's) Conference, first held in 1887.

Moody died at Northfield on the 22nd of December 1899. His sermons were colloquial, simple, full of conviction and point. In his theology he laid stress on the Gospel and on no sectarian opinions—he was, however, a pre-millenarian—and he worked with men as much more "advanced " than himself as Henry Drummond, whom he eagerly defended against orthodox attack, and George Adam Smith. Moody's sermons were sold widely in English, and also in Danish, Swedish, and German. In the official Life of Dwight L. Moody (New York, 1900), by his son, W. K. Moody (b. 1869), and the estimate in Henry Drummond's Dwight L. Moody: Impressions and Facts (New York, 1900), with an introduction by George Adam Smith.

MOOLVIE (an Urdu variant of Arabic mawlā, a derivative of mawlā, a man learned in the law), the name used in India of a man learned in Mahomedan law, and hence used generally of a teacher or as a complimentary title of one learned in any branch of knowledge.

MOON, SIR RICHARD, 1ST BARONET (1814-1890), English railway administrator, was the son of a Liverpool merchant, and was born on the 23rd of September 1814. The history of his life is practically the history of the London & North-Western railway for the period in which he lived. When he first became a member of the board in 1847, the company had just come into existence by the amalgamation of the London & Birmingham, the Manchester & Birmingham, and the Grand Junction lines, and it was during his long connexion with it—first as director and then (from 1862 to 1891) as chairman—that its system was developed substantially into what it is. The Ch. R. N. & W. (as it was called), the Manchester, Leeds & Carlisle, and many smaller lines were gradually added to it, either by leasing or by complete absorption, and finally in 1877 an act was obtained consolidating all into one homogeneous whole. Throughout his career, Sir Richard Moon's powers of organization and his genius for what may be called railway diplomacy were of the greatest advantage to the company, and to him it owed in very large measure its commanding position.

An extremely hard worker himself, he expected equal diligence of his subordinates; but energy and capacity did not go unrewarded, for he made promotions, not by standing or seniority, but by merit. Sir Richard Moon, who was created a baronet in 1887, died at Coventry on the 17th of November 1890.

MOON (a common Teutonic word, cf. Ger. Mond, Du. maan, Dan. måne, &c., and cognate with such Indo-Germanic forms as Gr. μόνος, Saws, mās, Irish mi, &c.; Lat. usus, i.e. luca, the shining one, lucere, to shine, for the moon, but preserves the word in mensis, month; the ultimate root for "moon" and "month" is usually taken to be me, to measure, the moon being a measurer of time), in astronomy, the name given to the satellite of any planet, specifically to the only satellite of the earth.

The subject of the moon may be treated as twofold, one branch being concerned with the aspects, phases and constitution of the moon; the other with the mathematical theory of its motion. As the varying phenomena presented by the moon grow out of its orbital motion, the general character of the latter will be set forth in advance.

A luminous idea of the geometrical relations of the moon,
precisely perpendicular to the plane of her orbit. This libration is
more regular than that in longitude, its amount being about
6° 44' on each side of the mean. The other side of the moon
is therefore invisible from the earth, but in consequence of the
libration about six-tenths of the lunar surface may be seen
at one time or another, while the remaining four-tenths are for
ever hidden from our view.

It is found that the direction of the moon's equator remains
nearly invariable with respect to the plane of the orbit, and
therefore revolves with that plane in a nodal period of 18-6
years. This shows that the side of the moon presented to us
is held in position as it were by the earth, from which it also
follows that the lunar globe is more or less elliptical, the longer
axis being directed toward the earth. The amount of the
eclipticity is, however, very small.

Two phenomena presented by the moon are plain to the naked
eye. One is the existence of dark and bright regions, irregular
in form, on its surface; the other is the complete illumination
of the lunar disk when seen as a crescent, a faint light revealing
the dark hemisphere. This is due to the light falling from
the sun on the earth and being reflected back to the moon.
To an observer on the moon our earth would present a surface
more than ten times as large as the moon presents to us, con-
sequently this earth-light is more than ten times brighter than
our moonlight, thus enabling the lunar surface to be seen by us.

The surface of the moon has been a subject of careful tele-
scopic study from the time of Galileo. The early observers
seem to have been under the impression that the dark regions
might be oceans; but this impression must have been corrected
as soon as the telescope began to be improved, when the whole
visible surface was found to be rough and mountainous.

The work of drawing up a detailed description of the lunar surface,
and laying its features down on maps, has from time to time
occupied telescopic observers. The earliest work of this kind,
and one of the most elaborate, is the Seleographia of Hevelius,
a magnificent folio volume. This contains the first complete map
of the moon. Names borrowed from geography and classical
mythology are assigned to the regions and features. A system
was introduced by Riccioli in his Almagestum novum of design-
nating the more conspicuous smaller features by the names of
eminent astronomers and philosophers, while the great dark
regions were designated as oceans, with quite fanciful names:
More imberium, Oceanus procularum, &c. More than a century
elapsed from the time of Hevelius and Riccioli when J. H.
Lilienthal published another profusely illustrated description of lunar topography.

The standard work on this subject during the 19th century was
long the well-executed description and map of W. Beer and J. H.
Mädler, published in 1836. It was the result of several years'
work; and microphotographic measurement of the features shown
by the moon. The volume of text gives descriptive details and measurement of the spots and heights of the mountains.

In recent times photography has been so successfully applied to
the mapping of our satellites as nearly to supersede visual
observation. The first photograph of the moon was a daguerreo-
type, made by Dr J. W. Draper of New York in 1840; but it
was not possible to do much in this direction until the more
sensitive process of photographing on glass was introduced
instead of the daguerreotype. The taking of photographs of
the moon then excited much interest among astronomical
observers of various countries. Bond at the Harvard observa-
tory, De la Rue in England, and Rutherford in New York,
produced lunar photographs of remarkable accuracy and beauty.

The fine atmosphere of the Lick observatory was well adapted
to this work, and a complete photographic map of the moon
on a large scale was prepared which exceeded in precision of
detail any before produced. The most extended and elaborate
work of this sort yet undertaken is that of Maurice Loewy
(1853-1907) and Pierre Puiseux at the Paris observatory, of
which the first part was published in 1892.

The broken and irregular character of the surface is most
evident near the boundary between the dark and illuminated
portions, about the time of first quarter. The most remarkable
feature of the surface comprises the craters, which are scattered everywhere, and generally surrounded by an approximately circular elevated ring. Yet another remarkable feature comprises bright streaks, branching out in various directions and through long distances from a few central points, especially that known as Tycho.

The height of the lunar mountains is a subject of interest. It cannot be stated with the same definitiveness that we can assign heights to our terrestrial mountains, for there is no fixed level on the moon to which elevations can be referred. The only determination that can be made on the moon is that of the height above some neighbouring hollow, crater or plain. The most detailed measures of this sort were made by Beer and Mügler, who give a great number of such heights. These generally range between 300 and 3000 toises, or 3000 and 20,000 English feet. The highest which they measured was Newton, 3727 toises, or 24,000 ft.

The general trend of lunar investigation has been against the view that there is any resemblance between the surface of the moon and that of the earth, except in the general features already mentioned. No evidence has yet been found that the moon has either water or air. The former, if it existed at all, could be found only in the more depressed portions; and even here it would evaporate under the influence of the sun's rays, forming a vapour which, if it existed in considerable quantity, would in some way make itself known to our scrutiny. The most delicate indication of an atmosphere would be through the refraction of the light of a star when seen coincident with the limb of the moon. Not the slightest change in the direction of such a star when in this position has ever been detected, and it is certain that if any occurs it can be but a minute fraction of a second of arc. As an atmosphere equal to ours in density would produce a deviation of an important fraction of a degree, it may be said that the moon can have no atmosphere exceeding in density the $5 \times 10^{-9}$ that of the earth.

Devoid of air and atmosphere, the causes of meteorological phenomena on the earth are non-existent on the moon. The only active cause of such changes is the varying temperature produced by the presence or absence of the sun's rays. The range of temperature must be vastly wider than on the earth, owing to the absence of an atmosphere to make it equable. Elaborate observations of the heat coming from the moon at its various phases were made and discussed in 1871-1872 by Lord Rosse. Among his results was that during the progressive phases from before the first quarter till the full moon the heat received increases in a much greater proportion than the light, from which it followed that the former was composed mainly of heat radiated from the moon itself in consequence of the temperature which it assumed under the sun's rays. So far as could be determined, 86% of the heat radiated was by the moon itself, and 14% reflected solar heat. But it seems probable that this disproportion may be somewhat too great. Rosse's determinations, like those of his predecessors, were made with the thermopile. After S. P. Langley devised his bolometer, which was a much more sensitive instrument than the thermopile, he, in conjunction with F. W. Very, applied it to determine the moon's radiation at the Allegheny observatory. His results for the ratio of the total radiation of the full moon to that of the sun ranged from 1:70,000 to 1:110,000, which were in substantial agreement with those of Rosse, who found 1:82,000. When Langley published his work the law of radiation as a function of the temperature was not yet established. He therefore wrongly concluded that the highest temperature reached by the moon approximated to the freezing-point of water. Stefan's law of radiation, on the other hand, shows that the temperature must have been about the boiling-point in order that the observed amount of heat might be radiated. This is in fair agreement with the computed temperature due to the sun's radiation upon a perpendicular absorbing surface when no radiation is lost through conduction to the interior. The agreement thus brought about between the results deduced from the law of radiation and the most delicate observa-

tions of the quantity of heat radiated is of great interest, as showing that the theory of cosmical temperature now rests upon a sound basis. There is, however, still room for improved determinations of the moon's heat by the use of the bolometer in its latest form.

Possibility of Changes on the Moon.—No evidence of life on the moon has ever been brought out by the minutest telescopic scrutiny, nor does life seem possible in the absence of air and water. Some bright spots are visible by the earth-light when the moon is at or near its extremity of phases, and were supposed by Herschel to be volcanoes in eruption. But these are now known to be nothing more than spots of unusual whiteness, and if any active volcano exists it is yet to be discovered. Still, the question whether everything on the moon's surface is absolutely unchangeable is as yet an open one, with the general trend of opinion toward the affirmative, so far as any actual proof from observation is concerned. The spot which has most frequently exhibited changes in appearance is near the centre of the visible disk, marked on Beer and Mügler's map as Linne. This has been referred to by several investigators, but the results are not as accordant as one might have expected. The most reliable determinations were made by G. P. Bond at Harvard and F. Zöllner at Leipzig, in 1860 and 1884. The mean result of these two determinations is the ratio 804. We may therefore say that the intensity of sunlight is somewhat more than half a million times that of full moonlight. A remarkable feature of the reflecting power of the moon, which was made known by Zöllner's observations, is that the proportion of light reflected by a region on the moon is much greater when the light falls perpendicularly, which is the case near the time of full moon, and rapidly becomes less as the light is more oblique. This result was traced by Zöllner to the general irregularity of the lunar surface, and the inference was drawn that the average slope of the lunar elevation amounts to 47°.

Motion of the Moon.—The orbit of the moon around the earth, though not a fixed curve of any class, is elliptical in form, and may be represented by an ellipse which is constantly changing its form and position, and has the earth in one of its foci. The eccentricity of the ellipse is in the general average about 0.055, whence the moon is commonly more than 1½ further from the earth at apogee than at perigee. The line of apsides is in continual motion, generally direct, and performs a revolution in about 12 years. The inclination to the ecliptic is a little more than 5°, and the line of nodes performs a revolution in the retrograde direction in 18.6 years. The parallax of the moon is determined by observation from two widely separated points; the most accurate measures are those made at Greenwich and at the Cape of Good Hope. The distance of the moon can also be computed from the law of gravity, the problem being to determine the distance at which a body having the moon's mass would revolve around the earth in the observed period. The measures of parallax agree perfectly with the computed distance in showing a mean parallax of 57° 20', and a mean distance of 238,800 miles. The period of revolution, or the lunar month, depends upon the point to which the revolution is referred. Any one of five such directions may be chosen, that of the sun, the fixed stars, the equinox, the perigee, or the node. The terms synodical, sidereal, tropical, anomalistic, nodical, are applied respectively to these months, of which the lengths are as follows:

MOON 805

Other numerical particulars relating to the moon are:
- Mean distance from the earth (earth's radius as 1) = 60.2634
- Mean apparent diameter = 31.515
- Diameter in miles = 31,564
- Mean surface of square miles = 14,600,000
- Diameter (earth's equatorial diameter as 1) = 0.0742
- Surface (earth's as 1) = 0.0202
- Volume (earth's as 1) = 0.002
- Radius (lune's mass) = 1:131.53 = 0:947
- Density (earth's as 1) = 0:96
- Density (water's as 1, and earth's as supposed as 5) = 3:46
- Ratio of gravity to gravity at the earth's surface = 1:6
- Inclination of axis of rotation to ecliptic = $1^\circ 30' 11.3''$

The Lunar Theory.

The mathematical theory of the moon's motion does not yet form a well-defined body of reasoning and doctrine, like other branches of mathematical science. The first classes of researches, extending through twenty centuries or more, and not easily welded into a unified whole. Before Newton the problem was that of devising empirical curves to formally represent the observed inequalities in the motion of the moon around the earth. After the establishment of universal gravitation as the primary law of the celestial motions, the problem was reduced to that of integrating the differential equations of the moon's motion, and testing the completeness of the results by comparison with observations. Although the precision of the mathematical solution has been increased beyond all doubt, the problem of completely reconciling this solution with the observed motions of the moon is not yet completely solved. Under these circumstances the historical treatment is best adopted to give a clear idea of the progress and results of research in this field. Modern researches were so naturally from the results of the ancients that we shall begin with a brief mention of the work of the latter.

It is in the investigation of the moon's motion that the merits of the ancient astronomers are seen to the best advantage. In the hands of Hipparchus the theory was brought to a degree of precision which is really remarkable when we compare it either with other branches of physical science in the same or with the views of contemporary non-scientific writers. The discoveries of Hipparchus were:

1. The Eccentricity of the Moon's Orbit.—He found that the moon moved most rapidly near a certain point of its orbit, and most slowly near the opposite point. The law of this motion was such that the phenomena could be represented by supposing the motion to be actually circular and uniform, the apparent variations being explained by the hypothesis that the earth was not situated in the center of the orbit, but was placed a distance of one-twentieth of the radius of the orbit from the center.

2. The Numerical Determination of the Elements of the Moon's Motion.—In order, that the two capital discoveries just mentioned should have the highest scientific value, it was essential that the numerical values of these constants should be fixed with precision. This Hipparchus was enabled to do by lunar eclipses. Each eclipse gave a moment at which the longitude of the moon was 180° different from that of the sun, as determined by the calculation. Assuming the mean motion of the moon to be known and the perigee to be fixed, three eclipses, observed in different points of the orbit, would give as many true longitudes of the moon, which longitudes could be employed to determine three unknown quantities—the mean longitude at a given epoch, the eccentricity, and the position of the perigee. By taking three eclipses separated at short intervals, both the mean motion and the motion of the perigee would be known beforehand, from other data, with sufficient accuracy to reduce all the observations to the same epoch, and thus to leave only the three elements already mentioned unknown. The same thing is accomplished in our own days by observing the second and third longitudes at as remote an epoch as possible, the difference in the

longitude of the perigee at the two epochs gave the annual motion of that element, and the difference of mean longitudes gave the eccentricity.

The eccentricity determined in this way is more than a degree in error, owing to the effect of the evvection, which was unknown to Hipparchus. The result of the latter inequality is brought out when it is sought to determine the eccentricity from the observations near the time of the first and last quarter. It was thus found by Ptolemy that an additional inequality existed in the position of the moon, which is now known as the evvection. The relations of the quantities involved may be shown by the following geometrical formula. If we put g for the moon's anomaly or distance from the perigee, and D for its elongation from the sun, the inequalities in question may be written as:

$$6.29 \sin g + 1.27 \sin (2D-g) = 0$$

During a lunar eclipse we always have D = 180°, very nearly, and we accordingly have the eclipse, which is now known as the evvection. The equation of the centre derived from eclipses is thus

$$6.29 \sin g + 1.27 \sin (2D-g) = 0$$

Thus, in consequence of the evvection, the equation of the centre comes out $2^o 30'$ larger from observations at the moon's quarters than during eclipses.

The forward step was due to Tycho Brahe. He found, that although the two inequalities found by Hipparchus and Ptolemy correctly represented the moon's longitude near conjunction and opposition, and also at the quadratures, it left a large outstanding error at the solstices, that is when the moon was 45 or 135° on either side of the sun. This inequality, which really the magnitude of nearly 1', is known as the variation. Although Tycho Brahe was an original discoverer of this inequality, through it he became known as the father of practical observations. He made the discovery for Abu 'l-Wafa, an Arabian astronomer, and made it appear that the latter really detected inequalities in the moon's motion which we now regard as the variation. But he has not shown, on the part of the Arabian, any such deduction from the inequality as is necessary to make clear his claim to the discovery. We may conclude the ancient history of the lunar theory by saying that the only real progress from Hipparchus to Newton consisted in the more exact determination of the mean motions of the moon, its perigee and its line of nodes, and in the discovery of three inequalities, the representation of which required geometrical constructions increasing in complexity with every step.

The modern lunar theory began with Newton, and consists in determining the motion of the moon by means of the differential equations of the gravitational force. But the great founder of celestial mechanics employed a geometrical method, ill-adapted to lead to the desired result; and hence his efforts to construct a lunar theory are of more historical interest than of practical utility. His incomplete results, however, laid the foundations for the modern method of determining the lunation by both trigonometric and dynamical means. The analytic method adopted is expressed by Laplace and by Alberth and Sir John W. Lubbock, and afterwards by Delaunay. By this method the motion of the moon is divided into two sets of equations, one of which determines the elements of the orbit, and the other gives the positions of the moon at the time of the observations. This method has the advantage of leading to a more rapid and certain
determination of the numerical quantities required. It has the disadvantage of giving the solution of the problem only for a particular case, and of being inapplicable in researches in which the governing dynamical equations are not satisfied. It has been employed by Damoiseau, Hansen, and Airy.

The methods of the second general class are those most worthy of attention. We must now consider the lunar theory of C. E. Delaunay, developed in his Théorie du mouvement de la lune (2 vols., 1866, 1867), because it contains a germ which may yet develop into the great desideratum of a general method in celestial mechanics.

Among applications of the third or numerical method, the most successful yet completed is that of P. A. Hansen. His first work, Fundamenta nova, appeared in 1835, and contained an exposition of the principles of a general method for the numerical computation of the motions of all the planets. In the twenty years following he devoted a large part of his energies to the numerical computation of the lunar inequalities, the redetermination of the elements of the several motions of the moon, and the production of tables for computing the moon's position. In the latter branch of the work he received material aid from the British government, which published his tables on their completion in 1857. The computations of Hansen were published some seven years later by the Royal Saxon Society of Sciences.

It was found on comparing the results of Hansen and Delaunay that there were discrepancies which have sufficient magnitude to demand the attention of those interested in mathematical theory of the subject. It was therefore necessary that the numerical inequalities should be again determined by an entirely different method.

This has been done by Ernest W. Brown, whose work may be regarded not only as the last word on the subject, but as embodying a seemingly complete and satisfactory solution of a problem which has absorbed so much importance of the energies of mathematical astronomers since the time of Hipparcos. We shall try to convey an idea of this solution. We have just mentioned the four small inequalities, $r$, $x$, $y$, and $z$, and two of the products of which the moon's co-ordinates have to be expressed. Euler conceived the idea of starting with a preliminary solution of the problem in which the orbit of the moon should be supposed to lie in the plane of the ecliptic, and to have no eccentricity, while that of the sun was circular. This solution being reached, the additional terms were found, which were multiplied by the first power of the second inequalities to determine the motion. Then the terms of the second order were found, and so on to the higher. In a series of available papers published in 1877–1888 Hill improved Euler's method, and worked it out with much more rigour and fullness than Euler had been able to do. His most important contribution to the subject consisted in working out by extremely elegant mathematical processes the method of determining the motion of the node. John Couch Adams afterwards determined the motion of the node in a similar way. The numerical computations were worked out by Hill only for the first approximation. The subject was then taken up by Brown, who in a series of papers published in 1877 in the Transactions of the Royal Astronomical Society and the Transactions of the American Mathematical Society, followed Hill's method so as to form a practically complete solution of the entire problem. The principal feature of his work was that the question of the acceleration was regarded not as a part of the numerical form, so that the uncertainties arising from development in a series accruing to its powers is done away with.

The principal solution of the main mathematical problem thus reached is that of the motion of the three bodies only—the sun, earth, and moon. The mean motion of the moon round the earth is then invariable, the longitude containing no inequalities of longer period than that of the moon's node, 18 6 y. But Edmund Halley found, by a comparison of ancient eclipses with modern observations, that the mean motion had been accelerated. This was confirmed by Richard Dunthorne (1711–1773). Corresponding to this observed fact was the inference that the perturbations of the larger bodies might have some way of influence the moon's motion. Thus a new branch of the lunar theory was suggested—the determination by theory of the effect of those perturbations.

The first step in constructing this theory was taken by Laplace, who showed that the secular acceleration was produced by the secular diminution of the earth's orbit. He computed the amount as about 10° per century, which agreed with the results derived by Dunthorne from ancient eclipses. Laplace's immediate successors, among whom were Hansen, Platé and Pontcroft, found a larger value, Hansen increasing it to 12°, which he introduced into his tables. This value, however, was found to represent fairly well several ancient eclipses of the sun, notably the supposed one of Thales. But Adams in 1853 showed that the period involved was by no means the true period of the secular acceleration, and that a more correct period of computation must be about one-half. This diminution was soon fully confirmed by others, especially Delaunay, although for some time Poncelet, a French astronomer, and the late Mr. Brown, held that the result was not quite accurate. But the demonstration of Adam's result was soon made conclusive, and a value which may be regarded as definitive has been derived by Brown. With the latest accepted diminution of the eccentricity, the coefficient is 5°91.

The question of the order of the discrepancy between the smaller values by theory, and the supposed values of 12° derived from ancient eclipses. In 1856 William Perrot showed that the action of the sun on the earth and moon, and consequently on a retardation of the earth's rotation, a result, at first unnoticed, which independently reached a few years later by Delaunay. Although the amount of retardation does not admit of accurate computation, owing to the immense length of the period and the number of small factors which it involves, it is of great interest to observe that the action of the moon on which produces the effect. But any rough estimate that can be made shows that it might well be supposed that the retardation will produce the observed difference of 6° per century. It was therefore surprising when, in 1877, Simon Newcomb found, by a study of the lunar eclipses observed by him and those observed by the English astronomers, that the apparent acceleration was much more reliable than the vague accounts of ancient solar eclipses—that the actual apparent acceleration was only about 8° . This is only 2° larger than the theoretical value, and it seems difficult to suppose that the effect of the tidal retardation can be as small as this. It suggests that the retardation may be in great part compensated by some accelerating cause, the existence of which is not yet well established. The following is a summary of the present state of the question:

The theoretical value of the acceleration, assuming the day to be constant, is

$$\frac{5°91}{2}$$

Hansen's value in his Tables de la lune is

$$\frac{12°19}{2}$$

Brown's revised, but still theoretically erroneous, result is

$$\frac{12°56}{2}$$

The value which best represents the supposed eclipses of Thales, (2) at Larissa, (3) at Sticklestad is

$$\frac{2°67}{2}$$

The result from purely astronomical observation is

$$\frac{2°67}{2}$$

Inequalities of Long Period.—Combined with the question of secular acceleration is another which is still entirely unsettled—the question of secular inequalities of the mean motion of the moon round the earth. Laplace first showed that modern observations of the moon indicated that its mean motion was really less during the second half of the 18th century than during the first half, and this he attributed to the existence of an inequality having a period of more than a century.

The existence of one or more such inequalities has been fully confirmed by all the observations, both early and recent, that have become available since the time of Laplace. It is also found by computation from theory that the planets do produce several appreciable inequalities of long period, as well as a great number of shorter period, in the motion of the moon. But the former do not correspond to the observed inequalities, and the explanation of the outstanding differences may be regarded to-day as the most perplexing enigma in astronomy. The most plausible explanation is that the secular acceleration, observed deviation is only apparent, and arises from slow fluctuations in the earth's rotation, and therefore in our measure of time produced by the motion of great masses of polar ice and the variability of the earth's figure. But the great number of apparent deviations in this case a similar inequality should be found in the observed times of the transits of Mercury. But the latter do not certainly show any deviation in the mean motion, and seem to preclude a deviation so large as that derived from observations of the moon. This suggests that inequalities in the action of the planets may have been still overlooked, the subject being too intricate with which celestial mechanics has to deal, but this action has been recently worked up with such completeness of detail by Radau, Newcomb and Brown, that the possibility of any unknown term seems out of the question. The enigma therefore still defies solution.

MOONSEED—MOORE, A. J.

MOONSEED, in botany, a common name for Menispermum, a genus of climbing deciduous shrubs, containing one species in North America and another in Eastern Asia. The former, M. condensata, is a handsome plant, suited to damp and shady walls, with large reniform peltate leaves and yellowish flowers borne in profusion on long pendulous racemes.

MOONSTONE, a variety of felspar, showing in certain directions a bluish opalescence, whence its value as an ornamental stone. When cut with a convex surface, it displays a soft milky reflection, forming a luminous band, but not sharply defined as in a cat's-eye. The moonstone is a variety of orthoclase known as adularia (see ORTHOCLASIE), whence the peculiar sheen has been called "adularescence." The effect is probably caused by interference from twin lamellae, or by numerous enclosures of microscopic laminae, definitely oriented, and it has been suggested that these may often be flakes of kaolin due to incipient decomposition of the felspar. Practically all the moonstone occurs in the granite-country of Ceylon, principally from the Dumbera district of the Central Province. It occurs as pebbles and irregular masses in the gem-graves and clay-deposits, and is also obtained by quarrying an adularia leptynite, as described by Dr. A. K. Coomaraswamy. Very similar in some respects to moonstone is the chatoyant soda-felspar, which was recognized by T. H. Aveston, often from Gr. κεράσι, a dove, in allusion to the resemblance of its lustre to that of the bird's neck. The original peristerite was from Bathurst, near Perth, Lanark county, Ontario, but it occurs also at Macomb, St Lawrence county, New York.

MOONWORM, or MOON-FERN, in botany, the popular name of a small fern (Botrychium Lunaria), belonging to the order Ophioglossaceae (Ferns). It has a tuberous root-stock and a stout flabby glabrous frond 3 to 6 in. long, with a sterile and fertile portion; the former bears several pairs of close-set, semi-circular or moon-shaped pinnae, the latter is pinnately branched and covered, on the face opposed to the sterile portion, with small globose sporae-cases which burst transversely. It is a widely distributed plant in the north and south temperate and cold zones, and is found in pastures and grassy banks in Britain.

MOOR. (1) A heath, an enclosed stretch of waste or uncultivated land, covered with heather; also such a heath preserved for game-shooting, particularly for the shooting of grouse. The O. Eng. mör, bog, moor, is represented in other Teutonic languages; cf. Dan. mør, Ger. Moor, O. Du. moer, &c.; from an O. Du. adjectival form morasch comes Eng. morasch, a bog. Probably mere, marsh, are not to be connected with these words.

(2) The verb "to moor," to fasten a ship or boat to the shore, to another vessel, or to an anchor or buoy, by cables, &c., is probably from the root seen in mod. Du. meren, which also gives the English nautical term "marline," small strands of rope used for lashings or seizures, and "marline-spike," a small iron tool for separating the strands of rope, &c.

MOORCROFT, WILLIAM (c. 1770-1825), English traveller, was born in Lancashire, about 1770. He was educated as a surgeon in Liverpool; but on completing his course he resolved to devote himself to veterinary surgery, and, after studying the subject in France, began practice in London. In 1795 he published a pamphlet of directions for the medical treatment of horses; in 1797 a special reference to India, and in 1800 a Curiosity Account of the Methods of Shoewing Horses. Having been offered by the East India Company the inspectorship of their Bengal stud, Moorcroft left England for India in 1808. Under his care the stud rapidly improved; in order to perfect the breed he resolved to undertake a journey into Central Asia to obtain a stock of Turkoman horses. In company with Captain William Hearsey, and encumbered with a stock of merchandise for the purpose of establishing trade relations between India and Central Asia, Moorcroft left Josimath, well within the mountains, until the 6th of May, 1819. Reaching the valley of the Sutlej, they reached the summit of the frontier pass of Niti on the 1st of July. Descending by the towns of Darba and Gartok, Moorcroft struck the main upper branch of the Indus near its source, and on the 5th of August arrived at the sacred lake of Manasarowar. Returning by Bhutan, he was detained some time by the Ghurkas, and reached Calcutta in November. This journey only served to whet Moorcroft's appetite for more extensive travel, for which he prepared the way by sending out a young Hindu, who succeeded in making extensive explorations. In company with him and George Trebeck, Moorcroft set out on his second journey in October 1819. On the 14th of August the source of the Beas (Hyphasis) was discovered, and subsequently that of the Chenab. Leh, the capital of Ladakh, was reached on the 24th of September, and here several months were spent in exploring the surrounding country. A commercial treaty was concluded with the government of Ladakh, by which the whole of Central Asia was virtually opened to British trade. Kashmir was reached on the 3rd of November 1822, Jalalabad on the 4th of June 1824, Kabul on the 20th of June, and Bokhara on the 25th of February 1825. At Andkhuit, in Afghan Turkestam, Moorcroft was seized with fever, of which he died on the 27th of August 1825, Trebeck surviving him only a few days. But according to the Abbé Huc, Moorcroft reached Lhasa in 1826, and lived there twelve years, being assassinated on his way back to India in 1838. In 1847 Moorcroft's papers were obtained by the Asiatic Society, and published, under the editorship of H. H. Wilson, under the title of Travels in the Himalayan Provinces of Hindostan and the Punjab, in Ladakh and Kashmir, in Peshawar, Kabul, Kunduz and Bokhara, from 1819 to 1825.

See Graham Sandford, The Exploration of Tibet (1904).

MOORE, ALBERT JOSEPH (1841-1893), English decorative painter, was born at York on the 4th of September 1841. He was the youngest of the fourteen children of the artist, William Moore, of York who in the first half of the 19th century enjoyed a considerable reputation in the North of England as a painter of portraits and landscape. In his childhood Albert Moore showed
an extraordinary love of art, and as he was encouraged in his tastes by his father and brothers, two of whom afterwards became famous as artists—John Collingham Moore, and Henry Moore, R.A.—he was able to begin the active exercise of his profession at an unusually early age. His first exhibited works were two drawings which he sent to the Royal Academy in 1857. A year later he became a student in the Royal Academy schools; but after working in them for a few months he decided that he would be more profitably occupied in inde-

dependent practice. During the period that extended from 1858 to 1870, though he produced and exhibited many pictures and drawings, he gave up much of his time to decorative work of various kinds, and painted, in 1863, a series of wall decorations at Coome Abbey, the seat of the earl of Craven; in 1865 and 1866 some elaborate compositions: "The Last Supper" and "The Feeding of the Five Thousand" on the chancel walls of the church of St Alban's, Rochdale; and in 1866 "A Greek Play," an important panel in tempora for the prosenium of the Queen's Theatre in Long Acre. His first large canvas, "Elijah's Sacrifice," was completed during a stay of some five months in Rome at the beginning of 1865, and appeared at the Academy in 1865. A still larger picture, "The Shunamite relating the Kings of Solomon to her Maidens," was exhibited in 1866, and with it two smaller works, "Apricots" and "Pomegranates." In these Albert Moore asserted plainly the particular technical conviction which for the rest of his life governed the whole of his practice, and with them he first took his place definitely among the most original of British painters. Of his subsequent works the most notable are "The Quartette" (1869), "Sea Gulls" (1871), "Follow-my-Leader" (1873), "Shells" (1874), "Topaz" (1879), "Rose Leaves" (1880), "Yellow Marguerites" (1881), "Blossoms" (1881), "Dreamers" (1882), "Reading Aloud" (1884), "Silver" (1886), "Midsummer" (1887), "A River Side" (1888), "A Summer Night" (1890), "Lightning and Light" (1892), "An Iddy" (1893), and "The Loves of the Winds and the Seasons," a large picture which was finished only a few days before his death. He died on the 27th of September 1893, at his studio in Spencer Street, Westminster. Several of his pictures are now in public collections; among the chief are "Blossoms," in the National Gallery of British Art; "A Summer Night" in the Liverpool Corporation Gallery; "Dreamers" in the Birmingham Corporation Gallery; and a water-colour, "The Open Book," in the Victoria and Albert Museum, South Ken-

lington. In all his pictures, save two or three produced in his later boyhood, he avoided any approach to story-telling, and occupied himself exclusively with decorative arrangements of lines and colour masses. The spirit of his art is essentially classical: his own paintings were always approached by study of antique sculpture; but he was not in any sense an archaeological painter, nor did he attempt reconstructions of the life of past centuries. Artistically he lived in a world of his own creation, a place peopled with robust types of humanity of Greek mould, and gay with bright-coloured draperies and brilliant-hued flowers. As an executant he was careful and certain; he drew finely, and his colour-sense was remarkable for its refinement and subtle appreciation. Few men have equalled him as a painter of draperies, and still fewer have approached his ability in the application of decorative principles to pictorial art.

MOORE, EDWARD (1712-1757). English dramatist and miscellaneous writer, the son of a dissenting minister, was born at Abingdon, Berkshire, on the 22nd of March 1712. He was the author of the domestic tragedy of *The Gamester*, originally produced in 1753 with Garrick in the leading character of Beverley the gambler. As a poet he produced clever imitations of Gay and Gray, and with the assistance of George, 1st Lord Lyttelton, Lord Chesterfield and Horace Walpole, conducted *The World* (1753-1757), a weekly periodical on the model of the *Rambler*. Moore collected his poems under the title of *Poems, Fables and Plays* in 1756. He died in Lambeth on the 1st of March 1757. His *Dramatic Works* were published in 1788.

MOORE, GEORGE (1833-1902), Irish novelist and poet, was born in Ireland, son of George Henry Moore, M.P., a well-known orator and politician. He studied art in London and finished his education in Paris. He was a regular contributor to various London magazines when he published his first volume, in verse, *The Flowers of Passion* (1877). A second, *Pagan Poems*, appeared in 1881. As a novelist he followed the success of *Flirtation and Zola* and became prominent for deliberate realism. His powerful *Mummer's Wife* (1885) had decidedly repulsive elements. But Zolasism meanwhile was a thing to which the reading public was gradually becoming acclimatized. George Moore's *Esther Waters* (1894), a strong story with an anti-gambling motive, had a more general success, and was followed by *Evelyn Innes* (1898), a novel of musical life, and its sequel, *Sister Teresa* (1901). He interested himself in the Irish Gaelic revival, and was one of the founders of the Irish Literary Theatre. His play, *The Strike at Arlingford* (three acts, in prose, 1899) was written for the Independent Theatre, and his satirical comedy, *The Bending of the Bough* (1900), dealing with Irish local affairs, was played by the Irish Literary Theatre in Dublin. His *Diarmuid and Grania*, written with Mr. W. B. Yeats, was produced by Mr. F. R. Benson's company at the same theatre in 1901. *The Untitled Field* (1903) and *The Lake* (1905) are romantic pictures of Irish life. Moore had originally come to the front in London about 1888 as an art critic, and his published work in that line includes *Impressions and Opinions* (1891) and *Modern Paintings* (1893, 2nd ed., 1897). Among his other books are *A Drama in Muslin*, (1886), *A Mere Accident* (1887), *Parrot and His Island* (1888), *Mike Fletcher* (1887), *Spring Days* (1888), *Vain Fortune* (1890), *Celtobes* (1895), *Confessions of a Young Man* (1888), and *Memoirs of My Dead Life* (1906).

MOORE, GEORGE FOOT (1831- ), American Biblical scholar, was born in West Chester, Pennsylvania, on the 15th of October 1851, the son of William Eves Moore (1823-1899), a prominent Presbyterian minister, long the permanent clerk of the Presbyterian General Assembly. The son graduated at Yale in 1872 and at Union Theological Seminary in 1877, was ordained in 1878, and from 1878 to 1881 was pastor of the Putnam Presbyterian Church, Zanesville, Ohio. He was Hitchcock professor of the Hebrew language and literature in Andover Theological Seminary in 1882-1902, and was president of its faculty in 1899-1901; in 1902 he became professor of theology and in 1904 professor of the history of religion at Harvard University. His chief critical work dealt with the Hexateuch, and more particularly the Book of Judges (Commentary, 1895; text, translation and notes, 1898; text with critical notes, 1900).

MOORE, GEORGE (1831-1895), English painter, the ninth son of William Moore, of York, and brother of Albert Joseph Moore, was born in that city on the 7th of March 1851. His artistic education was chiefly supervised by his father, but he also attended the York School of Design, and worked for a short time in the Royal Academy Schools. He first exhibited at the Academy in 1853, and was a constant contributor to its exhibitions till his death. At the outset of his career he occupied himself mostly with landscapes and paintings of animals, executed with extraordinary detail in imitation of the prevailing taste of the Pre-Raphaelite Brotherhood; but in 1857, while on a West of England tour, he made his first attempts as a sea-painter. His success was immediate, and it had the effect of diverting him almost entirely from landscapes. Among his most important canvases must be reckoned *The Pilot Cutter* in 1856, *The Salmon Poachers* in 1859, *The Lifeboat* in 1876, *Highland Pastures* in 1878, *The Beached Margent of the Sea* in 1880, *The Newhaven Packet* (bought by the Birmingham Corporation), and *Catspaws off the Land* (bought by the Chantrey Fund trustees); in 1885, *Mount's Bay* (bought by the Manchester Corporation) in 1890, *During the Net-take* in 1888, *Machrihanish Bay, Cantyre* in 1894, *Hove-to for a Pilot* in 1895, and *Glen Orchy*, a landscape, in 1895. He was elected an associate
of the Royal Society of Painters in Water Colours in 1876, and a full member in 1880; an associate of the Royal Academy in 1885, and an academician in 1893; and at Paris, in 1887, where he exhibited "The Newhaven Packet" and "The Clearness after Rain," he received a grand prix and was made a knight of the Legion of Honour. He died in London on 11 December 1895. His works are marked by admirable appreciation of nature, and by a rare understanding of wave-form and colour and of the subtleties of atmospheric effect; and as a sea-painter he may fairly be regarded as almost without a rival.

MOORE, JOHN (1729-1802), Scottish physician and writer, was born at Stirling in 1729, the son of a clergyman. After taking his medical degree at Glasgow, he served with the army in Flanders, then proceeded to London to continue his studies, and eventually to Paris, where he was attached to the household of the British ambassador. His novel Zelucu (1750), a close analysis of the motives of a selfish profligate, produced a great impression at the time, and indirectly, through the poetry of Byron, has left an abiding mark on literature. Byron said that he intended Childre Harold to be "a poetical Zelucu," and the most striking features of the portrait were undoubtedly taken from that character. Moore's other works have a less marked individuality, but his sketches of society and manners in France, Germany, Switzerland, Italy and England furnish valuable materials for the social historian. In 1792 he accompanied Lord Cornwallis to Paris, and was present at the principal scenes of the Revolution. His Journal during a Residence in France (1793) is the careful record of an eye-witness, and is frequently referred to by Carlyle. He died in London on the 21st of January 1802, leaving five sons, the eldest of whom was General Sir John Moore. James Moore (1763-1834), who wrote Sir John's Life, was also the author of some important medical works, and Sir Graham Moore (1764-1843), saw much active naval service and became an admiral.

MOORE, Sir CHARLES (1764-1800), British general, the son of John Moore, was born at Glascow on the 13th of November 1761. From his early years he intended to become a soldier, learned the Prussian firing exercise, and was "always operating in the field and showing how Geneva could be taken." By the Duke of Hamilton's influence he obtained an ensigncy in the 51st foot (1776), learned his drill at Minorca, and in 1778 was appointed captain-lieutenant in a new regiment raised by Hamilton for service in the American War. Moore remained in America to the peace of 1783, after which the Hamilton regiment was disbanded. In 1784 he was returned by the Hamilton interest as member of parliament for the unioned boroughs of Lanark, Selkirk, Peebles and Linlithgow. In parliament, though he never spoke, he seems to have taken his duties very seriously, and to have preserved an independent position, in which he won the friendship of Pitt and the respect of Burke, and (more important still) the friendship of the duke of York. In 1787 he became major in the 60th (now King's Royal Rifles), but in the following year he was transferred to his old corps, the 51st. In 1792 Moore sailed with his corps to the Mediterranean. He was too late to assist at Toulon, but was engaged throughout the operations in Corsica, and won particular distinction at the taking of Calvi, where he was wounded. Soon after this he became adjutant-general to Sir Charles Stuart, with whom he formed a close friendship. After the expulsion of the French Moore became very intimate with many of the leading Corsican patriots, which intimacy was so obnoxious to Sir Gilbert Elliot (later Lord Minto) that Moore was eventually ordered to leave the island in forty-eight hours, though Elliot wrote in warm terms of his ability. Pitt and the duke of York thought still more highly of Colonel Moore, who was soon sent out to the West Indies in the local rank of brigadier-general. Here he became under the command of Sir Ralph Abercromby, whose most valued adviser and subordinate Moore soon became. In the Santa Lucia expedition he won further distinction by his conduct at the capture of the Vigne and Morne Fortuné, and when Sir Ralph left the island he appointed Moore governor and military commander. In 1798 he accompanied Abercromby to Ireland as a major-general, and during the rebellion was actively engaged in command of a corps in the south, defeating a large force of the Irish, and saving Wexford from destruction after the battle of Vinegar Hill (June 21). His services were in universal request, and Abercromby had him appointed to the command of a brigade destined for the expedition to Holland. At the action of Egmont, in 1799, on the 8th of September, his brigade lost very heavily, and he himself was wounded for the fourth time, on this occasion severely. On his return from Holland he was made colonel of the 2nd regiment, with which he was connected for the rest of his career, and which under his supervision became one of the finest regiments in Europe.

Throughout the Egyptian expedition he commanded the reserve. The 38th and 42nd regiments in this corps gained great distinction at the battle of Alexandria, where Moore himself was again wounded. He returned to duty, however, before the surrender of the French forces to General Hutchinson, and added so much to his reputation by his conduct in this brilliant campaign that after the short peace came to an end he was appointed to command the force assembled at Shorncliffe camp (1803) as a part of the army intended to meet the projected invasion of Napoleon. Here were trained some of the best regiments of the service, amongst others the 43rd, 52nd and 95th Rifles, the regiments which afterwards formed the famous "Light Division" and won in the Peninsula an unsurpassed record of brilliancy for the skilful performance of the duties of light troops, but also for invincible steadiness in the line of battle. These corps (now represented in the army by the 1st and 2nd battalions of the Oxfordshire Light Infantry and the Rifle Brigade) bore the impress of Moore's training for thirty years and more, and as early as 1804, on account of the "superior state" of the 52nd, the king granted the officers exceptional promotion (August 29, 1804). The system of light infantry tactics taught at Shorncliffe was not invented by Moore; but he had always advocated the creation of these troops, and he was the first to push the training of them at Shorncliffe. While at Shorncliffe he renewed his intimacy with Pitt, who was then residing at Walmer Castle, and his close friendship with Lady Hester Stanhope led to the erroneous belief that he was betrothed to her. On his return to office Pitt caused Moore to be made a Knight of the Bath, and about the same time came his promotion to the rank of lieutenant-general. Fox, when he succeeded to office, showed the same appreciation of Moore, and in 1806 sent him to the Mediterranean as second-in-command to his brother, General H. E. Fox. In the various minor expeditions of the time Moore had a share, at first as a subordinate, but soon, when Fox went home on account of ill-health, as commander-in-chief of the British army employed in the Mediterranean. About this time he formed an attachment for Caroline Fox (afterwards the wife of Sir William Napier), to whom, however, he did not offer marriage, fearing to "influence her," by his high position and intimacy with her father, "to an irretrievable error for her own future contentment" (Life of Sir C. Napier, I. 39). In 1808 Moore was ordered to the Baltic, to assist Gustavus IV., king of Sweden, against Russia, France and Denmark. The conduct of the king, who went so far as to place Sir John Moore under arrest when he refused to acquiesce in his plans, ruined any chance of successful co-operation, and the English general returned home, making his escape in disguise. He was at once ordered to proceed with his division to Portugal, where he was to be under the command of Sir Hew Dalrymple and Sir Harry Burrand. To Moore, as a general of European reputation, who had held a chief command, the appointment of two senior officers to be over him appeared as a bitter insult, though his resentment did not divert him from his duty. He repelled his reward (for when, in the excitement caused by the invention of Cintra, Dalrymple and Burrand were ordered home, Moore was left in command of the largest British army that had been employed since the commencement of the war. Wellesley, who returned home with the other generals, showed his appreciation of Moore, and in an interesting letter (Wellington Despatches, Oct. 8, 1808) expressed his desire to use his own
great political influence to effect a reconciliation between Moore and the ministers.

It was not long before the Spaniards summoned Sir John Moore’s army to assist them against the advance of Napoleon, and the troops were marched into Spain, Salamanca being their rendezvous. There Moore remained for a month, calling up Sir David Baird’s corps from Corunna to assist him. Soon, however, the overwhelming success of the emperor’s attack threatened to isolate Moore, and it was then that he formed the magnificent resolution of marching northwards against the French with 15,000 men. The bold and skilful operations which followed this step will be found outlined in the article PENINSULAR WAR. Moore’s advance paralysed the Emperor’s victorious armies. Napoleon himself turned against the British army, which was soon in grave danger, but Spain was saved. Under these circumstances took place the famous retreat on Corunna. The indiscretion of a large proportion of the troops made it painful and almost disastrous, but the reserve under Edward Paget, in which served Moore’s old Shropshire regiments, covered itself with glory in the ceaseless rearguard fighting which marked every step of the retreat. The march ended with the glorious battle of Corunna (Jan. 16, 1809), where, early in the day, Sir John Moore received his death wound. He would not suffer his sword to be unbuckled, though the hilt galled his wound, and so he was borne from the field. His last hours were cheered by the knowledge of victory, and his only care was to recommend his friends, and those who had distinguished themselves, to the notice of the government. He died with the name of Lady Hester Stanhope on his lips. By his own wish he was buried, before dawn on the 17th, in the ramparts of Corunna. Sir John Moore designed that a monument should be erected, with an inscription framed by himself, and the Spanish general La Romana afterwards carried out Soulé’s wishes. The temporary monument thus erected was made permanent in 1811 by Sir Howard Douglas, acting for the prince regent. The duke of York issued to the army on the 1st of February a noble order in which reference was made to the services of the general, and, above all, to the fact that “the life of Sir John Moore was spent among the troops.” A memorial was erected in St Paul’s Cathedral by order of parliament early in 1826, and in the native city of Glasgow erected in George Square a bronze statue by Flaxman. The poem by the Rev. Charles Wolfe, “The Burial of Sir John Moore,” became one of the most popular in the language. The best-known portrait of Sir John Moore is that by Sir Thomas Lawrence, P.R.A.

For many years controversy, largely political, raged over the events of the Corunna campaign, and only at a later period has any examination of Sir John Moore’s merits and services been made in a dispassionate spirit. Mistakes were doubtless made in the retreat, but it is sufficient to accept Napoleon’s view that they were probably inseparable from the difficulties with which Moore was surrounded. His greatest claim to renown is, however, independent of his conduct of armies in the field. He was the finest trainer of men that the British army has ever known. He had the true gift of the great man, judgment of character. While Wellington, whose work would have been vain but for Moore’s achievements, perpetually complained of his officers and formed no school, Moore’s name is associated with the career of all who made their mark. The history of the Light Division is sufficient in itself to indicate the respect of Moore’s training on the rank and file. Opposition to the majority, who regarded the lash and the gallows as the source of discipline, he sought always and by every means to develop the moral qualities no less than the physical. Of the senior officers Hope, Graham, Edward Paget, Hill and Craufurd all felt and submitted to his ascendency. The flower of the younger generation, Colborne, Hardinge and the Napiers, even though they gained their laurels under Wellington and in chief command, were ever proud to call themselves “Sir John Moore’s men.”

See, besides the works mentioned in the article PENINSULAR WAR, J. C. Moore, Life of Sir John Moore (1833); Sir J. F. Maurice, Sir John Moore’s Journal (1904); and the Records of the 52nd (Oxfordshire Light Infantry). A shorter memoir will be found in Twelve British Soldiers (London, 1899).

MOORE, THOMAS (1779–1852), Irish poet, was born in Dublin on the 28th of May 1779. His father was John Moore, a prosperous grocer and wine merchant, and his mother’s maiden name was Anastasia Codd. In 1793 Tom Moore’s name first appeared in print, as a contributor of some verses “To Zelia,” to a Dublin periodical, the Anthologia Hibernica. In the same year Roman Catholic students began to be admitted to Trinity College, Dublin, and in 1794 Moore’s name was entered on the books, curiously enough, as a Protestant. At Trinity he made friends with Robert Emmet, and was nearly dragged into the plots of the United Irishmen. The events of 1798 and the execution of Emmet in 1803 made a deep impression on him. The words of Emmet’s address to his judges, asking the charity of silence—“Let no man write my epitaph”—are enshrined by Moore in one of his lyrics, “Oh, breathe not his name!” (Irish Melodies, 1808).

The next song in the same collection—“When he who adores thee”—also owes its inspiration to Emmet’s fate, and the conscientious Orientalism of Lalla Rookh does not conceal the pre-occupation of the writer with the United Irishmen when he writes of “The Fire Worshippers,” and with Emmet and Sarah Curran when he describes the loves of Hafed and Hinda, especially in the well-known song, “She is far from the Land where her young Hero sleeps.” In 1798 Moore graduated, and in the next year left for England to keep his terms at the Middle Temple.

He rapidly became a social success in London. Joseph Addison of Creetagh, who proposed to the ordnance board, had been attracted to Moore in Dublin at first by his gifts as a singer. He now gave him an introduction to Francis Rawdon-Hastings, 2nd earl of Moira, who invited him to his country seat at Donington Park, Leicestershire. Here Moore became a frequent guest. He had brought with him from Ireland a translation of the Odes of Anacreon, and the prince of Wales consented to have the volume dedicated to him. It was issued in 1800 with notes and a list of distinguished subscribers. His social successes involved him in expenses far beyond his means. His publisher had advanced him money, and he resolved to pay his debt by the anonymous publication of his juvenile poems, The Poetical Works of the Late Thomas Little, Esq. (1801), a collection of love poems which Moore afterwards regretted. Through Lord Moira’s influence he was, in 1803, appointed registrar of the admiralty prize-court at Bermuda. He went there to take possession of the post, but soon tired of the monotonous life, and in 1804, after appointing a deputy, returned to England by way of the United States and Canada. In 1806 he published Epistles, Odes and other Poems, chiefly dealing with his impressions of travel. The volume contained the “Canadian Boat Song” (“Tainly as tolls the evening chime”), and some love poems of the same kind as those connected with the name of “Mr Little.” Jeffrey made an unjustifiable onslaught on this collection in the Edinburgh Review for July 1806. Moore was in his view “the most licentious of modern versifiers, and the most poetical of those who, in our time, have devoted their talents to the propagation of immorality,” and the book was a “public nuisance.” Moore challenged Jeffrey, and a duel was arranged at Chalk Farm. The police interrupted the proceedings. Jeffrey’s pistol was found to be unloaded, and the duelman afterward established a fast friendship between them.

The success of the satirical epistles in the 1806 volume encouraged Moore to produce further work of a similar kind, Corruption and Intolerance, Two Poems (1808), and The Sceptic: a Philosophical Satire (1809), but the heroic couplet and the manner of Pope did not suit his talents. At the end of 1806 he went to Dublin, and, with the exception of about six months in 1807 spent at Donington Park, the next three years were spent in Ireland. Here he met Miss Elizabeth Dyke, an actress, who became his wife in March 1811. They lived at first in London, but soon removed into the country, to Keggworth, near Lord Moira’s seat, and then to Mayfield Cottage, near
Ashbourne, Derbyshire. Moore had to spend much of his time in London, for the popularity of his songs led to an agreement with his publisher to increase the success of these by singing them himself at concerts. The inception of his Irish Melodies dates from 1807, and many of the best were written during the three years of his Irish visit. He had already published separate songs, some of them set to music of his own, when William Power suggested to him in 1807 the task of fitting words to a series of Irish airs supplied by Sir John Stevenson. He could not have found a task more exactly suited to his powers, and for a quarter of a century he enjoyed a regular income of £500 a year from Power for writing words to music. The two volumes of Irish Melodies appeared in 1807, and contained some of his best and most popular work. The best appeared between 1808 and 1834. In 1816 Stevenson and Moore published Sacred Songs, followed by a second number in 1824. In 1818 they began to adapt melodies from other nations. The first number of National Airs appeared in 1818, and was followed by others in 1820, 1822, 1826, and 1827.

After 1812 he broke ground in a new field—political squib-writing. His first buff was the prince regent, once his friend and patron, whose foibles, fatness, love for cutlets and curassao, forsook him by a payment through, which was settled with the lightest of clever hands. His earlier political poems appeared in the Morning Chronicle, but in 1813 he published a thin volume of Intercepted Letters: The Twopenny Post Bag. Other volumes of squibs, most of which passed through several editions, followed: The World at Westminster (1816), The Fudge Family in Paris (1818), The Journal of a Member of the Pococurante Society (1820), Fables for the Holy Alliance (1823), Odes on Cash, Corn, Catholics, and other Matters (1828), The Fudge Family in England (1832). The only failure among his satirical writings was Tom Crib's Memoirs of the Country (1839) for which he had made an elaborate study of thieves' argots.

In 1814 he contracted with the firm of Longmans to supply a metrical romance on an Eastern subject, which should contain as least as many lines as Scott's Rokeby, the publishers binding themselves to pay £300 guineas on delivery. Moore had begun Lalla Rookh two years before. He was a careful and laborious writer, and retired to a cottage in the neighbourhood of Donington Park, where with the help of Lord Moira's library he read himself slowly into familiarity with Eastern scenery and manners. He was already far advanced in his work when Byron hit The Giaour, and again in The Bride of Abydos largely forestalled him. The depression following on the peace of 1815 deferred the publication of Lalla Rookh until 1817. It was an immediate success. The Eastern local colouring which dazzled Moore's contemporaries has, however, faded, and the interest still existing in the poem is chiefly due to the underrun of the picturesque in which the cleverly worked into it. Immediately after the completion of Lalla Rookh, Moore removed with his family to Sloperton Cottage, Wiltshire, where he was close to Bowood, Lord Lansdowne's country seat. Moore's plans were interrupted by the embargo of some £5000 by the deputy he had left in Bermuda, for whose default he was fully liable. To avoid a debtors' prison Moore retired to the Continent. He visited Byron in Italy, and in October 1819 received from him the first part of the Memoirs. The continuation was sent to Moore in Paris the next year, with Byron's suggestion that the reversion of the MS. should be sold. Moore did not remain long in Italy, but made his home in Paris, where he was joined by his wife and children. He was not able to return to England until 1822, when the Bermudian affair was concluded and the long-anticipated Lalla Rookh of £5000 Moore had had many offers of help, but preferred to be indebted to his publishers only. During his exile he had written another Oriental poem, The Loves of the Angels (1822), which was hardly less popular than Lalla Rookh. He now became a contributor of satirical verse to The Times, the connexion lasting until 1827. He now wrote his Memoirs of the Life of Sheridan, first contemplated in 1814, which appeared, after some delay, in 1825. The Memoirs of Captain Rock (1824), in which he gives a humorous but convincing account of English misgovernment in Ireland, was the result of a tour with Lord Lansdowne in western Ireland. His prose tale, The Epicurean, appeared in 1827, and the Legendary Ballads in 1828. In 1831 he completed his Life and Death of Lord Edward Fitzgerald, probably his best piece of prose work.

The death of Byron in 1824 raised the question of the publication of his Memoirs. Moore had parted with them in 1821 to John Murray for £3000. After they had come into Murray's possession, Moore began to have doubts about the propriety of publishing them, and an arrangement was therefore made that the £3000 should be regarded as a loan, to be repaid during Byron's lifetime, and that the MS. should be retained as a security. When Byron died the debts were still unreclaimed, and the right of publication therefore rested with Murray. Moore now borrowed the money from Longmans and induced Murray to give up his claim. The money was paid, and, after a heated discussion with Byron's executors, the MS. was burnt. It was partly the pressure of the debt thus contracted, and partly the expressed wish of Byron, that induced Moore to undertake for Murray The Letters and Journals of Lord Byron, with Notices of his Life (1830). The difficult task was executed with great success, and each letter is marked by a characteristic touch, and it remains, with all its defects and omissions, a valuable record.

Moore's countrymen desired him to accept a seat in parliament for Limerick. The offer was accompanied by a scheme to present Moore with an estate in the county worth £300 a year. It was made through the poet Gerald Griffin, who has left on record an account of the interview. Moore declined the honour. In 1830 he allowed himself to be drawn into a project for writing a History of Ireland (4 vols., 1835, 1837, 1840 and 1846) for Lardner's Cyclopaedia. He hoped that by the history of Ireland he might arouse in his own countrymen an interest in their past, and open the eyes of Englishmen to the misgovernment of the country. He had neither the historical training nor the despatch in writing which enabled Scott to scribble off the companion volumes on Scotland, and the history sat like a nightmare on him, and was left unfinished on the melancholy collapse of his powers in 1845. He had, however, the temper of the student, and was always a voracious reader.

Moore's last years were harassed by pecuniary difficulties, all by the weakness and misconduct of his sons, the elder of whom retired from the English army to enter the foreign legion of France. After the death of his last child in 1845, Moore became a total wreck, but he lived until the 25th of February 1852. He left sufficient provision for his wife in the Diary which he kept chiefly on her behalf.

His other works are, A Letter to the Roman Catholics of Dublin (1810); A Melodrama upon National Music (1811); an operaetta, M.P. or The Blue Stocking (1811); A Set of Gleeys (1823); The Summer Fête (1831); Evenings in Greece (1826–1832); Travels of an Irish Gentleman in Search of a Religion; Alciphron, a Poem (1839).

See Memoirs, Journal and Correspondence of Thomas Moore (8 vols., 1853–1856), ed. by Lord John Russell, which contains an immense quantity of biographical material; The Poetical Works of Thomas Moore, Collected by Himself (10 vols., 1840–1842); also Notes from the Letters of Thomas Moore to his Music Publisher. James Power (1854); and Prose and Verse, Humorous, Satirical and Sentimental, by Thomas Moore, with suppressed passages from the Memoirs of Lord Byron... (1878), which includes Moore's contributions to the Edinburgh Review (1814–1834). Among modern editions of Moore's Poetical Works may be mentioned that by Charles Kent (the Centenary ed., 1879), and that by W. M. Rossetti (1882). The history of Moore are prefixed to these editions. There are many contemporary references to him, especially in the journals and letters of Byron. There is an excellent life, by Stephen Gwynn, Thomas Moore (1905), written for the "English Men of Letters Series." See also biographies by G. W. Wood, L. V. Lomas, and an essay on him as the poet "of Irish opposition and revolt" in Georg Brandes, Main Currents in Nineteenth Century Literature (vol. i., 1875; Eng. trans., 1905).

MOORHEAD, a city and the county-seat of Clay county, Minnesota, U.S.A., opposite Fargo, North Dakota, on the East Bank of the Red River and about 215 m. N.W. of Minneapolis. Pop. (1890), 2088; (1900), 3703; (1905), 4704; (1910),...
MOOR-HEN—MOORS

4840. Moorhen is served by the Great Northern and the Northern Pacific railways. The city is the seat of one of the state normal schools (1888) and of Concordia College (Norwegian Lutheran; 1891), which in 1907–1908 had 500 students. Moorhead, named in honour of James K. Moorhead (1806–1884), a Republican representative in Congress from Pennsylvania in 1859–1869, was settled in 1871, was incorporated as a village in 1875, and was chartered as a town by 1881. It is the site of the University of North Dakota, and was the site of the famous bonfire display in 1882, by the students of the university.

Of the larger species, P. coerules is the "Porphyrio" of the ancients, and inhabits certain localities on both sides of the Mediterranean, while the rest are widely dispersed within the tropics, and even beyond them, as in Australia and New Zealand. But this last country has produced a more exaggerated form, Notornis, which is an interesting and perhaps unique history. First described from a fossil skull by Sir R. Owen,3 and then thought to be extinct, an example was soon after taken alive, and the skin of which (with that of another procured like the first by Walter Mantell) may be seen in the British Museum. Other fossil remains were from time to time noted by Sir R. Owen; but it began to be feared that the bird had ceased to exist, until a third example was taken about the year 1879, the skin and most of the bones of which, after undergoing examination in New Zealand by Sir W. Buller and T. J. Parker,4 found their way to the museum of Dresden, where A. B. Meyer discovered the recent remains to be specifically distinct from the fossil, and while keeping for the latter the name N. mantelli gives the former that of N. hochstetteri. What seems to have been a third species of Notornis formerly inhabited Lord Howe's Island, but is now extinct. Whether the genus Aptornis, of which Owen described the remains from New Zealand, was most nearly allied to Notornis and Porphyrio cannot here be decided. T. J. Parker considers it a "development by degeneration of an oscidrome type." (See OCYDROME.)

MOORS (Lat. Mauri; Gr. Μαυροί, dark men), the name which, as at present used, is loosely applied to any native of Morocco, but in its stricter sense only to the townsmen of the Mohammedan faith. The Moorish name of the Moors is "Mauri," and it is applied to a number of tribes of the north-western African tribes, the northwestern districts of that continent came to be called by the Romans Mauretaniam. The term "Moors" has no real ethnological value. The tribes known to the Romans by that name were undoubtedly of Berber stock (see BERBERS). They first appear in history at the time of the Jugurthine War (110–106 B.C.), when Mauretaniam west of the Mulucha was under the government of a king called Bocchus, and appears to have constituted a regular and organized state.

It retained its independence till the time of Augustus, who in 25 B.C. bestowed the sovereignty of the previously existing kingdom upon Juba II., king of Numidia, at the same time uniting it with the western portion of Numidia, from the Mulucha to the Ampsag, which received the name of Mauretaniam Caesariensis, while the province of Bocchus and Andavia, or a smaller cognate species, G. haematopus, with red legs; tropical Africa has the smallest of all, G. angulata. One of the most remarkable varieties is the G. nestis of Tristan da Cunha,5 which has wholly lost the power of flight.6 Among other forms are the common Gallinula (Erythra) phoenicura, and Gallinica cristata of India, as well as the South American species classed in the genus Porphyrio, and the remarkable Australian genus Tribonyx contains three species,7 which seem to be more terrestrial than aquatic in their haunts and habits.

Allied to the genus Porphyrio, including the bird so named by classical writers, and perhaps a dozen other species often called sultanas and purple water-hens, for they all have a plumage of deep blue—some becoming violet, green, or black in parts, but preserving the white lower tail-coverts, so generally characteristic of the group; and their beauty is enhanced by their scarlet bill and legs. Two, P. affinis of the Ethiopian region and the South American P. para, are of small size.

1 Not to be confounded with "Moor-cock" or "Moor-fowl," names formerly in general use for the red grouse.

3 A somewhat intermediate form seems to be presented by the moor-hen of the island of St. Denis, to the north of Madagascar (Zoologist, 1867, p. 1036).

5 Notwithstanding the evidence, which presented some incongruities, offered by Mr Mackay (1865, 1867, p. 144).

8 Thus the leg-bones and what appeared to him the sternum were described, as figures mm., but it was afterwards proved that the pelvis and another femur (vii. pp. 360, 373, 374, xxii.) but the supposed sternum afterwards proved not to be that of Notornis, and Owen (Proc. 1882, p. 689) rectified the error, to which his attention had been drawn, and which he had already suspected (Trans. viii. 120).

the coast towns and the plains of Morocco, occupied largely by Arabs. The name Moor is however still applied to the populations speaking Arabic who inhabit the country extending from Morocco to the Senegal, and to the Niger as far east as Timbuktu, i.e., the western Sahara. In this vast region and in all the towns of Barbary many of the Andalusians settled.

The Moors are ethnically a very hybrid race with more Arab than Berber blood. A common mistake is to regard them as a black race, as indicated by the old English phrase "Black-a-Moor," i.e., black as a Moor. They are a white race, though often sunburnt and bronzed for generations, and both their children and those who have lived in the cities might pass anywhere as Europeans.

The typical Moors of Morocco are a handsome race, with skin the colour of coffee-and-milk, with black eyes and black silky hair, and the features of Europeans. They wear a full beard, and are characterized by a marked dignity of demeanour. There is a general tendency to obesity, which is much admired by the Moors in their women, young girls being stuffed like chickens, with paste-halls mixed with honey, or with spoonfuls of olive oil and sesame, to give them the necessary corpulence. The Moors are an intellectual people, courteous in manner and not altogether unlettered; but they are cruel, revengeful and bloodthirsty. Among the pirates who infested the Mediterranean none were worse than the Moors.

They are fanatical Mahomedans, regarding their practice of worship as so sacred that the mere approach of a Jew or a Christian is forbidden. The Moors are temperate in their diet and simple in their dress, though among the richer classes of the town, to save the cost of the longer silks, gold and precious gems, while the men indulge to excess their love of fine horses and splendid "arms." The national fault is gross sensuality. The position of women is little better than a landed slavery. They are uneducated, indolent and vicious. Such education as the children receive is of a superficial kind. Slavery flourishes, and slave auctions, conducted like those of cows and mules, take place on the afternoons of stated days, affording a lounge for the rich Moors, who discuss the "goods" offered and seek for bargains. This public sale of slaves was prohibited in the coast towns c. 1856, under pressure from European powers, but means are now used to evade the prohibition.

Of games the young Moors play a great number; the principal one is a kind of football, more like that of Siam and Burma than that of England; wrestling and fencing are popular, but the chief amusement of the adult Moors is the "powder-play" (la'ab el bôrâd), which consists of a type of military tournament, the horsemen going through lance and musket exercises or charging in review fashion, firing volleys as they gallop. Other recreations much in favour throughout Morocco are music, singing, jugglery, snake-charming and acrobatic performances. As professional story-tellers many Moors are remarkable, but the national music is monotonous and not very harmonious.

See Dr. Arthur Leared, Morocco and the Moors (1891); Budgett Meakin, The Moorish Empire (1899); and The Moors (1902); Frances Macnab, A Ride in Morocco (1902); and see under Morocco; Mauretania; Berbers, &c.

MOOSE, the North American Indian (Algonquian) name of the North American representative of the European elk (q.v.). The word is said to mean "cropper" or "trimmer," from the animal's habit of feeding on the branches of trees.

MOP, a bunch of cloth, rags or coarse yarn, fastened to a pole and serving as a broom or brush for swabbing up wet floors or other surfaces and for cleaning generally. The word is usually taken to be an adaptation of Lat. mappa, cloth, napkin, cf. "map." A particular application of the term in provincial English is to an annual hiring or statute-fair, a "mop-fair," at which domestic and agricultural servants out of places attended, carrying a broom, a mop or other implement indicative of their calling.

MOPlah (Malayalam mappl, a fanatical Mahomedan sect of the Malabar. "The Moplahs, who number upwards of a million, are believed to have descended from Arab immigrants who landed on the western coast of India in the 3rd century after the Hegira. They are remarkable for the fanaticism displayed in successive attacks upon the Hindus, and they have several times resisted British troops. A regiment of the Indian army was recruited among them, but the experiment proved a failure, and the Moplah Rifles were disbanded in April 1907.

MOPSUS, in Greek legend, the name of two seers. (1) Son of Ampyx (or Ampykos) and the nymph Chloris, a Lapith of Oechealia in Thessaly. He took part in the Calydonian boar hunt and accompanied the Argonauts as their prophet. He died from the bite of a serpent which sprang from the blood of the Gorgon Medusa. He is represented on the chest of Cypselus as boxing with Admetus. He was afterwards worshipped as a hero and an oracle was consecrated to him. (2) Son of Rhacias (or Apollo) and Manto, daughter of Teiresias. The rival seer Calchas is said to have died of chagrin because the predictions of Mopsus were fulfilled, while his own proved incorrect. Together with another seer, Amphialus, Mopsus founded Mallus in Cilicia after the return from Troy; and in a quarrel for its possession both lost their lives. According to Pausanias (vii. 3) Mopsus expelled the native inhabitants of Caria, and built the town of Colophon. Mopsus was worshipped as a god by the Cilicians, and had two famous oracles at Colophon and Mallus. His name survives in the town of Mopsuestia (Μοψουστία) and the spring of Mopsucrene. Mopsus appears to be the incarnation of Apollo of Chars.

MOQUEGUA, a maritime province of southern Peru, bounded N. by the departments of Arequipa and Puno, and S. by the republic of Chile. Area, 5550 sq. m.; pop. (1906 estimate), 31,020. The province extends from the Pacific coast eastward to the Cordillera Occidental, which forms the boundary line with Puno and the republic of Bolivia. Eastern Moquegua is volcanic, and is broken by the high range that forms the western rim of the Titicaca basin. Among the volcanoes in the province are Taitapacu, the last eruption of which occurred in 1802, Huaynaputina and Hachalahuaya, which were in violent eruption in 1866, Coropuna, Omate, Ubinas and Candarave—the last three still showing signs of activity. This region is also subject to severe earthquake shocks. On the lower slopes of the Cordillera there are fertile irrigated valleys which produce grapes and olives for commercial purposes, and a considerable variety of fruits, cereals and vegetables for local consumption. The best-known grape-producing districts are Moquegua (capital) and Locumba—the product being converted into wine and brandy for export. The capital is Moquegua (pop. about 9000 in 1906), in the upper valley of the Ilo River, 4500 ft. above sea-level, and 65 m. by rail from the small port of Ilo on the Pacific coast.

Moquegua was formerly one of the three provinces forming a department of the same name. The other two provinces (Tacna and Arica) were held for indemnity by Chile after the war of 1879-1883 with the understanding (treaty of Ancon, March 8, 1884) that at the expiration of ten years a plébiscito should be taken in the two provinces to determine whether they should remain with Chile, or return to Peru—the country to which they should be annexed to pay the other 10,000,000 pesos. Chile did not comply with this treaty agreement, and in 1910 still held both provinces.

MORA, José (1585-1725), Spanish sculptor, was a pupil of Alonso Cano. He died in Granada in 1725 and was buried in
the Albaicín church. His work can be usefully studied in the eight statues in the Capella del Cardenal in the Cordova Cathedral and in the figures of St Bruno and St Joseph in the Cartuja near Granada.

See B. Haendeke, Studien zur Geschichte der spanischen Plastik (Strasburg, 1900).

**MORCA**, or **Morra** (Ital. delay), a game, universally popular in Italy, in which one player endeavours to guess instantly the number of fingers held up by the other. Ancient Egyptian sculptors represent a game of this kind, and it was played by the Romans, who called it *micare digitis*, or finger-flashing. It is known to the Chinese and to certain tribes of the Pacific Islands. There are several methods of playing mora, but in the one most common in Italy the two players, placed face to face, throw out at the same instant one or more fingers of one hand, each crying out simultaneously a number guessed to be that of his adversary's exposed fingers. A correct guess counts one; if both guess correctly or wrongly there is no score. The game, which is generally five or nine points, is played for stakes, and with extraordinary swiftness.

**MORACEAE**, in botany, an order of dicotyledons, belonging to the series *Urticiflorae*, to which belongs also the nettle family (*Urticaceae*, q.v.). It contains about 60 genera with about 1000 species, mostly trees or shrubs, widely distributed in the warmer parts of the earth. The largest genus, *Ficus* (the fig, q.v.), contains 600 species spread through tropical and sub-tropical regions, and includes the common fig of the Mediterranean region (*Ficus carica*), the banyan (*F. bengalensis*), and the India-rubber plant (*F. elastica*); many of the species are epiphytic, sometimes clinging so tightly round the host-plant with their roots as to strangle it. *Morus* (mulberry, q.v.) contains ten species of trees or bushes in north temperate regions and in the mountains of the tropics. *Artocarpus*, including *A. incisa* (bread-fruit, q.v.), and *A. integrifolia* (jack-tree), has forty species, chiefly natives in the Indian Archipelago. The plants are rich in latex which may be very poisonous as in *Antiaris toxicaria*, the Upas-tree (q.v.) of Java, or sweet and nutritious as in *Brosimum galactodendron*, the cow-tree (q.v.) of Venezuela. The latex often yields caoutchouc as in species of *Ficus* (e.g. *F. elastica*), *Ceatropia* (q.v.), a tropical American genus with thirty to forty species, and others.

**End of Shoot showing Stipule, 5, of India-rubber Plant (Ficus elastica), 1 nat. size.**

The leaves, which are either or more or less divided, are stipulate, the stipules being small and lateral as in *Morus* and allied general or intrapetiolar, each pair uniting to form a cap round the younger leaves, as in *Ficus* and allied genera, and very well shown in *F. elastica*, the common India-rubber plant of greenhouses. The plants are monoecious or dioecious, and the small unisexual flowers are borne in cymose inflorescences which are condensed into apparent racemes, spikes, or heads. In the fig they coalesce to form a fleshy hollow axis on the inner face of which the flowers are situated, while in *Dorstenia* they form a flat, often lobed, expansion with the flowers sunk on the upper face. The flower resembles

**Mulberry (Morus nigra), Shoot bearing Leaves and Fruit, ½ nat. size.**

that of *Urticaceae*; there are generally four free or more or less united perianth leaves, with, in the male flower, a stamen opposite each perianth leaf; the filaments are incurved in the mulberry and allied genera and straight in the fig and its allies. *Artocarpus* has only one stamen. The female flower contains two carpels in the median plane, the posterior one of which is often more or less abortive. Each developed ovary chamber contains a solitary pendulous more or less curved ovule. The fruit is an achene or drupe, often surronded by the fleshy perianth and still further complicated by the union of fruits of different flowers as in mulberry, the development of a fleshy receptacle as in fig, or as in *Artocarpus* (bread-fruit), by the union of fruits, perianth and axis into a solid fleshy mass. The embryo is generally curved and surrounded by a fleshy endosperm.

From the evidence of leaf-fossils it is probable that the genus *Ficus* existed as far north as Greenland in the Cretaceous era and was generally distributed in North America and Europe in the Tertiary period up to Miocene times.

**MORADABAD**, a city and district of British India, in the Bareilly division of the United Provinces. The city is on the
right bank of the river Ramganga, 655 ft. above sea-level, and has a station on the Oudh & Rohilkhand railway, 868 miles from Calcutta. Pop. (1901), 75,128. It was founded in 1625 by Rustam Khan, who built the fort which overhangs the river bank, and the fine Jama Masjid or great mosque (1631). The town forms a large centre of trade in country produce. It has a special industry in ornamental brassware, sometimes plated with lac or tin, which is then engraved. Cotton weaving and printing is also carried on. The District of Moradabad lies east of the Ganges and west of the native state of Rampur. Area, 2,285 sq. m. It lies within the centrifugal Godown plain, and is demarcated into three subdivisions by the river Ramganga. It consists of a submontane country, with an elevation slightly greater than the plain below, and is traversed by numerous streams descending from the Himalayas. The central portion consists of a level central plain descending at each end into the valleys of the Ramganga and Sot. The western section has a gentle slope towards the Ganges, with a rapid dip into the lowlands a few miles from the bank of the great river. In addition to Moradabad the principal towns are Amroha (p.o.), Sultanpur, and Chaudansi (15,771). For the history of Moradabad see BAREKLY. It passed into the possession of the British in 1861. The population in 1901 was 1,191,993, showing an increase of 11.1% in the decade. Mahommadeans are more numerous than in any other district of the province, forming more than one-third of the total. The principal crops are wheat, rice, millet, pulse, sugar-cane and cotton. The main line of the Oudh & Rohilkhand railway traverses the district from south to north, with branches towards Aligarh and Rampur. A third branch from Moradabad city towards Delhi crosses the Ganges at Garhmukhteshwar by a bridge of green span on each end.  

MORAES, FRANCISCO DE (c. 1500–1572), Portuguese romance writer, was probably born at the close of the 15th century. We know very little of his life, except that he was treasurer of the household to King John III., and he is first found in Paris in the suite of the Portuguese ambassador, D. Francisco de Noronha, who had gone there in 1540. He was a commander of the Order of Christ, and was called O Palmeirim on account of his authorship of the famous romance of chivalry Palmeirim de Inglaterra; in 1572 he was assassinated at Evora. He appears to have written his romance in France (perhaps in Paris) in 1544, dedicating it to the Infanta D. Maria, daughter of King Manoel, but the first extant Portuguese edition only came out in 1567. A Spanish version was published as early as 1548, and on the strength of this many critics have contended that the book was originally written in that language and that Moraes only translated it into Portuguese. Both tradition and a critical examination of the Portuguese and Spanish texts, however, tell overwhelmingly in favour of the first being the original with Moraes as its author. The episode of the four French ladies shows an intimate acquaintance with the court of Francis I., where Moraes spent some years, and on one of these ladies named Torsi is the one he loved and to whom he addressed some verses entitled “Desculpa de huns amores.” The Palmeirim de Inglaterra belongs to another branch of the same cycle as the Amadis de Gaula; the two romances are the best representatives of their class, and for their merits were spared from the auto da fé to which Cervantes condemned other romances of chivalry in D. Quixote. It has a well-marked plot, clearly drawn characters, and an admirable style, and has been reckoned a Portuguese classic from the time of its issue.  

MORAINE, a term adopted from the French for the rocky material carried downwards on the outside of a glacier, and deposited at its sides and foot. The position of the moraine with regard to the glacier is indicated by the names applied to it. The lateral moraine is the fringe of rock fragments at the glacier side. The glacier is always slowly moving down the valley. There are always points in the valley where rock falls are more frequent than in other places. The glacier as it moves forward catches this material and carries it onward in a long heaped line distributing it evenly all down the valley sides. When two glacial valleys converge into one valley two lateral moraines unite at the point of junction and form a median moraine in the resulting glacier, which now has two lateral moraines and one median. All this material carried by the glacier is deposited where the glacier ends, and forms the terminal moraine, frequently in the form of a crescent dam across the valley. This material is carried farther downwards by stream action and distributed; otherwise the end of all glacier valleys would be blocked with débris against which the ice would be piled to a great height, and the glacier would finally become stationary. The material pushed forward beneath the glacier is sometimes called the ground moraine, the ground left beneath the ice of the old glacier, that carried to the edge and dropped the dump moraine, and that carried forward the push moraine. (See Glacier.)  

MORAN, EDWARD (1829–1901), American artist, was born at Bolton, Lancashire, England, on the 19th of August 1829. He emigrated with his family to America at the age of fifteen, and subsequently settled in Philadelphia, where after having followed his father’s trade of weaver, he became a pupil of James Hamilton and Paul Weber. In 1862 he became a pupil of the Royal Academy in London; he established a studio in New York in 1872, and for many years after 1877 lived in Paris. He was a painter of marine subjects and examples of his work are in many prominent collections. Among his canvases are thirteen historical paintings, intended to illustrate the marine history of America from the time of Leif Ericson to the return of Admiral Dewey’s fleet from the Philippines in 1899. He died in New York City on the 6th of June 1901. His sons (Edward) Percy Moran (b. 1862) and Léon Moran (b. 1864), and his brothers Peter Moran (b. 1842) and Thomas Moran (q.v.), also became prominent American artists.  

MORAN, THOMAS (1837– ), American artist, was born at Bolton, Lancashire, England, on the 12th of January 1837, and emigrated with his parents to America in 1844, the family settling in Philadelphia. After having been apprenticed for some years to a wood-engraver, he studied under his brother Edward and under James Hamilton, in Philadelphia, and later studied in London, Paris and Italy. In 1871 he accompanied Professor F. V. Hayden’s exploring expedition to the Yellowstone, and in 1873 he went down the Colorado with Major J. W. Powell’s famous exploring party; and on these two trips he made sketches for two large pictures, “The Grand Canon of the Yellow-stone” and “Chasm of the Colorado River,” both of which were bought by the United States government and are now in the Capitol at Washington. He became a member of the National Academy of Design in 1884 and of the American Water Color Society. His wife, Mary Nimmo Moran (1842–1899), who was born in Strathaven, Scotland, and emigrated to America in 1852, was also an artist, and was particularly prominent as an etcher.  

MORAR, a town of Central India, in the native state of Gwalior, 3 m. E. of Gwalior city. Pop. (1901), 19,779. It was formerly by a British military cantonment and residence of a political agent, but in 1886, when the fortress of Gwalior was restored to Sindhia, the troops at Morar were withdrawn to Jhansi, and the extensive barracks were likewise made over to Sindia. In the Mutiny of 1857 Morar was the scene of the most serious uprising in Central India. It is a centre for local trade, and has an important tanning industry.  

MORAT (Ger. Murten), a small town on the east shore of the Lake of Morat, in the Swiss canton of Fribourg, and by rail
14 m. N. of Fribourg or 18½ m. W. of Bern. In 1900 its population was 2,263, of whom 1,840 were German-speaking and 160 were Protestants. It is a most picturesque little town, overlooked by the 13th-century castle and the quadrangle of the Rathhaus, while it is still surrounded by its 15th-century walls that it made use of at intervals with watch towers. In 1264 it exchanged its position as a free imperial city (enjoyed since 1218) for the rule of the count of Savoy. In 1475 it was taken by the Swiss at the commencement of their war with Charles the Bold, duke of Burgundy, whose ally was the duchess of Savoy. But in 1476 it was besieged by Charles, though it held out till the Swiss army arrived in haste and utterly defeated (22nd June) the Burgundians. An obelisk a little way south-west of the town stands on the site of the bone-house (destroyed by the French in 1796), where the remains of many Swiss soldiers who had been massacred at Morat were collected and finally annexed to Switzerland in 1798 by Bern and Fribourg, being then annexed to Fribourg in 1814. The Lake of Morat has an area of 10½ sq. m., and is connected by that of Neuchâtel by way of the Broye canal. On its shores many lake dwellings have been found.

See F. L. Engelhard, Der Staat Murer Chronik (Bern, 1828); G. O. Henscheln, Die Urkunden der Belagerung u. Schlacht von Morat (Erlangen, 1870); H. Wattelet, Die Schwerdt vom Rathaus (Fribourg, 1894). (W. B. A. C.)

MORATA, OLYMPIA FULVIA (1526-1555), Italian classical scholar, was born at Ferrara. Her father, who had been tutor to the young princes of the ducal house of Este, was on intimate terms with the most learned men of Italy, and the daughter grew up in an atmosphere of classical learning. At the age of twelve she was able to converse fluently in Greek and Latin. About this time she was summoned to the palace as companion and instructress of the younger but equally gifted Anne, daughter of Renée, Duchess of Ferrara. Olympia's father having died a convert to Protestantism, she met with a cold reception at the palace, and withdrew to her mother's house. Olympia now embraced the doctrines of Luther and Calvin. About the end of 1550 she married a young student of medicine and philosophy, Andrew Grunthler of Schweinfurt in Bavaria. In 1554 she accompanied Grunthler to his native place, where he had been appointed physician to the garrison of Spanish troops. In 1555 the margrave Albert of Brandenburg on one of his plundering expeditions took possession of Schweinfurt, and was in turn besieged by the Protestants. At length Albert evacuated the place, and Olympia and her husband made their escape. They finally succeeded in reaching Heidelberg (1554), where a medical lectureship had been obtained for Grunthler through the influence of the Erbach family, by whom they had been hospitably entertained during their flight. Her mother died on the 29th of October in the following year.

BIBLIOGRAPHY.—The scanty remains of her works—letters, dialogues, sermons, lectures, &c.—were collected and published by Celio Secundo Curtone (1558). Monographs by Caroline Bowles, wife of Robert Southey the poet (1834). J. Bonnet (1850; Eng. trans., Edinburgh, 1854), and R. Turnbull (Boston, 1840); see also Caroline Garey, Daughters of Italy (1886).

MORATALLA, a town of eastern Spain, in the province of Murcia, 40 m. W.N.W. of the city of Murcia. Pop. (1900), 12,689. Moratalla is built on a mountainous peninsula, almost surrounded by the Grande and Benamor, small rivers which meet and flow eastward to join the Segura. The town is a labyrinth of narrow, crooked streets, and some of its houses are Moorish in character. Its chief buildings are the modern hospital and theatre, and the 17th-century church. It has manufactures of coarse cloth, spirits and soap. The nearest railway station is Calasparra, 6 m. east, on the Murcia-Albacete railway.

MORATÓN, LEANDRO ANTONIO ESPINOSA MELITÓN FERNANDEZ DE (1760-1828), Spanish dramatist and poet, the son of N. F. de Moratón, was born at Madrid on the 10th of March 1760. Though his poetical tastes were early developed, his father apprenticed him to a jeweller. At the age of eighteen Moratón won the second prize of the Academy for a heroic poem on the conquest of Granada, and two years afterwards he attracted more general attention with his Lección política, a satire upon the popular poets of the day. He was appointed secretary to Cabarrús on a special mission to France in 1787. On his return to Spain, Moratón was tonsured and presented to a sincere benefice in the diocese of Burgos, and in 1786 his first play, El Viejo y la niña, was produced at the Teatro del Príncipe. Owing to the opposition of the clerical party, it was speedily withdrawn. The prose comedy, El café ó la comedia nueva, given at the same theatre six years afterwards, at once became popular. On the fall of Florida Blanca, Moratón found another patron in Godoy, who provided him with a pension and the means for foreign travel; he accordingly visited England, where he began a prose translation of Hamlet, printed in 1798 but never performed. From England he passed to the Low Countries, Germany, Switzerland and the Italian peninsula. He returned to the Peninsula in 1796 was appointed official translator to the foreign office. In 1803 he produced El Borín en su propia forma; originaly written (1791) as a zarzuela, it was shamelessly plagiarized by Andrés de Mendoza, but the recast, a far more brilliant work, still keeps the stage. It was followed in 1804 by La Moguigata, written between 1797 and 1803. This piece was favourably received, and an attempt to suppress it on religious grounds failed. Moratón’s crowning triumph in original comedy was El St de los Niños (1806), which was performed night after night to crowded houses. A part of several Spanish petitions in a year, and was soon translated into a number of foreign languages. In 1808 Moratón was involved in the fall of Godoy, but in 1811 accepted the office of royal librarian under Joseph Bonaparte—a false step, which alienated from him all sympathy and compelled him to spend his last years in exile. In 1812 his Escuela de los maridos, a translation of Molière’s École des maris, was produced at Madrid, and in 1813 El Médico a Pales (a translation of Le Médecin malgré lui) at Barcelona. From 1814 to 1828 Moratón lived in Italy and France, compiling a work on the early Spanish drama (Origenes del teatro español). He died at Paris on the 21st of June 1828.

The most convenient edition of his works is that given in vol. ii. of the Biblioteca de autores españoles; this is supplemented by the Obras póstumas (3 vols., Madrid, 1867-1868).

MORATÓN, NICOLÁS FERNANDEZ DE (1737-1780), Spanish poet and dramatist, was born at Madrid in 1737. He was educated at the Jesuit College in Calatayud and afterwards studied law at the university of Valladolid. In 1772 he was called to the bar; four years afterwards he was nominated to the chair of poetry at the imperial college. He died on the 25th of May 1780, and is remembered as a partizan of the absolutist method. Moratón published in 1762 his Desengaño al teatro español, a severe criticism of the national drama, particularly of the auto sacramental; and his protests were partly responsible for the prohibition of autos three years afterwards (June 1765). In 1762 he also published a play entitled La Pelímeta. Neither the Pelímeta nor the Luceria (1763), an original tragedy still more strictly in accordance with French conventions, was represented on the stage, and two subsequent tragedies, Hormesuida (1770) and Guzmán el Bueno (1777), were played with no great success. In 1764 Moratón published a collection of pieces, chiefly lyrical, under the title of El Poeta, and in 1765 a short didactic poem on the chase (Diana ó arte de la caza). His “épic canto” on the destruction of his ships by Cortés (Las Naves de Cortés destruidas) failed to win a prize offered by the Academy in 1777, and was published posthumously (1785). But a better idea of Moratón’s talent is afforded by his analectic verses and by his Carta histórica sobre el origen y progresos de las fiestas de toros en España.

His works are included in the Biblioteca de autores españoles, vol. ii. (Madrid, 1860).

MORATORIUM (from Lat. moratii, to delay), a term used to express a legal authorization postponing for a specified time the payment of debts or obligations. The term is also sometimes used to mean the period over which the indulgence or period of grace stretches, the authorization itself being called a moratory law. A moratory law is usually passed in some special period of political or commercial stress; for instance, on several occasions during the Franco-German War the French government passed
MORAVIA

Moravian laws. Their international validity was discussed at length and upheld in Rouquette v. Overman, 1875, L. R. 10 Q. B. 525.

MORAVIA (Ger., Märzen; Czech, Morava), a margraviate and crownland of Austria, bounded E. by Hungary, S. by Lower Austria, W. by Bohemia and N. by Prussia and Silesia. Area, 8,833 sq. m. Physically Moravia may be described as a mountainous plateau sloping from north to south, just in the opposite direction of the adjoining Bohemia plateau, which descends from south to north, and bordered on three sides by mountain ranges. On the north are the Sudetes, namely the Altvater Gebirge, with the highest peaks the Großer Schneeberg (4664 ft.) and the Altvater (4687 ft.), which sink gradually towards the west, where the valley of the Oder forms a break between the German mountains and the Carpathians. The latter separate Moravia from Hungary. Parallel to the Carpathians are the Marsegebirge (1015 ft.) and its continuation, the Steinitzer Wald (1450 ft.). On the west are the so-called Bohemian-Moravian Mountains, forming the elevated east margin of Bohemia. The principal passes are those at Iglau and Zwittau to Bohemia and the Wlara Pass to Hungary. Almost the whole of Moravia belongs to the basin of the March or Morava, from which it derives its name and which rises within its territory in the Sudetes. It traverses the whole country in a course of 1460 m., and enters the Danube near Pressburg. Its principal tributaries are the Altvater, the Wiesenberg and the Linzer Thaya, which with the Altvater and the Brunn. These latter rivers are succeeded by the river Morava. These new colonists became the permanent inhabitants of this district, and in spite of the hostility of the Avars on the east founded the kingdom of Great Moravia, which was considerably more extensive than the province now bearing the name. Towards the end of the 6th century they aided Charlemagne in his wars against the Avars, and were rewarded by being received as part of it, corresponding to North Hungary, as a fief of the German emperor, whose supremacy they also acknowledged more or less for their other possessions. After the death of Charlemagne the Moravian princes took advantage of the dissensions of his successors to enlarge their territories and assert their independence, and Rastislau (c. 859) even formed an alliance with the Bulgarians and the Byzantine emperor. The chief result of the alliance with the latter was the conversion of the Moravians to Christianity by two Greek monks, Cyril and Methodius, despatched from Constantinople (863). Rastislau finally fell into the hands of Louis the German, who blinded him, and forced him to end his days as a monk; but his successor, Svatopluk (d. 894), was equally vigorous, and extended the kingdom of Great Moravia to the Oder on the west and the Gran on the east. At this period there seemed a strong probability of the junction of the north-western and south-eastern Slavs, and the formation of a great Slavonic power to east of the German empire. This prospect, however, was dissipated by the invasions of the Magyar hordes in the 10th century, the brunt of which was borne by Moravia. The invaders were encouraged by the German monarchs and aided by the discontents and mismanagement of the successors of Svatopluk, and in a short time completely subdued the eastern part of Great Moravia. The name of Moravia was henceforth confined to the district to which it now applies. For about a century the possession of this marchland was disputed by Hungary, Poland and Bohemia, but in 1029 it was finally incorporated with Bohemia, and so became an integral part of the German empire. Towards the close of the 12th century Moravia was raised to the dignity of a margraviate, but with the princes who sat on it should be held as a fief of the crown of Bohemia. It henceforth shared the fortunes of this country, and was usually assigned as an apagane to younger members of the Bohemian royal house. In 1410 Jobst, margrave of Moravia, was made emperor of Germany, but died a few months after his election. In 1426, on the death of Louis II. of Hungary Moravia came with the rest of
of that prince's possessions into the hands of the Austrian house. During the Thirty Years' War the depopulation of Moravia was so great that after the peace of Westphalia the states-general published an edict giving every man permission to take two wives, in order to "repeople the country." After the Seven Years' War Moravia was united in one province with the remnant of Silesia, but in 1849 it was made a separate and independent crownland. The most noticeable feature of recent Moravian history has been the active sympathy of its inhabitants with the anti-German movement while agitation of the Bohemian Czechs.

MORAVIAN BRETHREN, or Moravian Church, a Christian communion founded in the east of Bohemia. For some years after the death of John Huss (1415), the majority of his followers were split into two contending factions: the Hussite Wars began; and the net result of the conflict seemed to be that while the Utraquists, content with the grant of the cup to the laity, were recognized by the pope as the national Church of Bohemia (1433), the more radical Taborites were defeated at the battle of Lipan (1434) and ceased to exist. But with this result some of Huss's followers, who wished to preserve his spiritual teaching, were not content. They laid great stress on purity of morals; and convinced that the Utraquist Church was morally corrupt, they founded a number of Independent societies, first at Kremser and Meseritsch in Moravia, and then at Wilenow, Diwischau and Cheliec in Bohemia. At this crisis Peter of Cheliec, the leader of the advanced reforming party, in ethics he anticipated much of the teaching of Tolstoy; in doctrine he often appealed to the authority of Wycliffe; and in some of his views it is possible to trace the influence of the Waldenses. He interpreted the Sermon on the Mount literally, denounced war and oaths, opposed the union of Church and State, and declared that the duty of all true Christians was to break away from the national Church and return to the simple teaching of Christ and His apostles. His followers were known as the Brethren of Cheliec, and wore a distinctive dress. His most noted supporter was John Rockycana, archbishop-elect of Prague. He was pastor of the Thein Church (1444), preached Peter's doctrines, recommended his works to his hearers, and finally, when these hearers asked him to lead them, he laid their case before King George Podiebrad, and obtained permission for them to settle in the deserted village of Kunwald, in the barony of Senftenberg. It was here that the new community was founded (1457 or 1458). At their head was Gregory, the patriarch; a layman, said later to be Rockycana's nephew; in Michael Bradacius, the priest of Senftenberg, they found a spiritual teacher; and fresh recruits came streaming in, not only from the other little societies at Kremser, Meseritsch, Cheliec, Wilenow and Diwischau, but also from the Waldenses, the Adamites, the Utraquist Church at Königgratz, and the university of Prague. They called themselves Jednota Bratrská, i.e. the Church or Communion of Brethren; and this is really the correct translation of their later term, Unitas fratrum. At the Synod of Lhota (1457), they broke away entirely from the papacy, elected ministers of their own, and had Michael Bradacius consecrated a bishop by Stephan, a bishop of the Waldenses. At the synod of Reichena (1459), they rejected the authority of the pope; and Peter of Cheliec, and accepted the Bible as their only standard of faith and practice. In doctrine they were generally broad and radical. They taught the Apostles' Creed, rejected Purgatory, the worship of saints and the authority of the Catholic Church, practised infant baptism and confirmation, held a view on the Sacrament similar to that of Zwingli, and, differing somewhat from Luther in their doctrine of justification by faith, declared that true faith was "to know God, to love Him, to do His commandments, and to submit to His will." With the Brethren, bishops were the chief stewards of doctrine, but on conduct. For this purpose they instituted a severe system of discipline, divided their members into three classes—the Perfect, the Proficient, and the Beginners, and appointed over each congregation a body of lay elders. For the same purpose they made great use of the press. In 1501 Bishop Luke of Prague edited the first Protestant hymn-book; in 1502 he issued a catechism, which circulated in Switzerland and Germany and fired the catechetical zeal of Luther; in 1565 John Blaboslaw translated the New Testament into Bohemian; in 1579-1593 the Old Testament was added; and the whole, known as the Kralitza Bible, is used in Bohemia still. The constitutionRatio disciplinaris, of the Brethren, was approved by the Austrian bishops, and after the Thirty Years' War was introduced into Moravia.

The revival of the Moravian Brethren was German in origin. Of the "Hidden Seed" the greater number were Germans; they were probably descended from a colony of German Waldenses, who had come to Moravia in 1480 and joined the Church of the Brethren; and, therefore, when persecution broke out after they naturally fled to the nearest German refuge. With Christopher David, a carpenter, at their head, they crossed the border into Saxony, settled down near Count Zinzendorf's estate at Berthelsdorf, and, with his permission, built the town of Herrnhut (1722-1727). But under Zinzendorf the history of the Moravians took an entirely new turn. He was a fervent Lutheran of the Pietist type; he believed in Spencer's "ecclesia sola" conception; and now he tried to apply the conception to the Moravian refugees. For some years he had a measure of success. Instead of reviving Moravian orders at once, the settlers attended the Berthelsdorf parish church, regarded themselves as Lutherans, and agreed to a code of "statutes" drawn up by the count, which embodied the Augsburg Confession as their standard of faith, and, joining with some Lutheran settlers in a special Communion service in Berthelsdorf (Aug. 13, 1727), had such a powerful unifying experience that modern Moravians regard that day as the birthday of the renewed Moravian Church. From that period two conflicting ideals were at work among the Moravians. In form the Moravian Church was soon restored. Before long persecution broke out against Herrnhut; the count sent a band of emigrants to Georgia; and as these emigrants would require other ministers, he had David Nitschmann consecrated a bishop by Zabliansky (1735). In this way the Moravian orders were maintained; the "ecclesia sola" became an independent body, and the British parliament recognized the Brethren as "an ancient Protestant Episcopal Church" (1749, 22 Geo. II. cap. 120). And yet, on the other hand, Zinzendorf's conception continued long in force. It hampered the Brethren's progress in Germany, and explains the smallness of their numbers there. Instead of aiming at Church extension, they built settlements on the estates of friendly noblemen, erected Brethren's and Sisters' houses, and cultivated a quiet type of spiritual life. It is true that they evangelized all over Germany; but this part of their work was known as the Diaspora (1 Pet. i. 1); and the idea
underlying this word is that the Brethren minister to the "scattered" in other churches without drawing them into the Moravian Church. In Germany, therefore, the importance of the Moravians must be measured, not by their numbers, but by their influence upon other Christian bodies. It was from the Moravians that Schleiermacher learnt his religion, and they even made a passing impress on Goethe; but both these men were repelled by their doctrine of the substitutionary sufferings of Christ.

In reply to the very natural question why the Moravians began their work in England, the answer given by history is that John Wesley was strongly impressed by John and Charles Wesley in the year 1735, who had also written a tract on the Mahometan question. That on his return he met Prince Leopold, who was on his way to North Carolina; that through Boheler's influence both John and Charles Wesley were "converted" (1738). For a few years they took an active share in the Evangelical Revival (1738-1755); but Zinzendorf's "eclesiastical" policy prevented their growth, and not till 1853 did the English Moravians resolve to aim at "the extension of the Brethren's Church." In foreign missions the distinctive feature about the Moravians is, not that they were so early in the field (1732), but that they were the first Protestants to clearly and thoroughly to the conviction that the mission was the duty of the Church as such. Hitherto it had been a part of colonial policy. It was this that made their missions so influential.

Present Condition.—I. Enterprise: (1) Foreign missions in Labrador, Alaska, Canada, California, West Indies, Nicaragua, Demerara, Surinam, Cape Colony, Kaffiria, German East Africa, Nuseland, and Java. (2) In America; the province of Labrador, (1867). (3) Diaspora in Germany, Switzerland, France, Denmark, Norway, Russia, Poland. (4) Church extension in Germany, Great Britain, Canada, the United States, the Cape Colony, South Africa, New Zealand, Australia, and the Pacific Islands. (5) Church in Brazil, Surinam, the Amazon, the Himalaya, and the Philipine Islands. (6) The general extension of the Church is still in its infancy. The number of members elected by each province, certain ecclesiastical members, and representatives from the mission field. At present the Moravian Church is divided into four provinces, German, British, American North and American South (North Carolina). In provincial matters each province is independent, holds its own synods, makes its own laws, and elects its own governing board; but the General Synod meets, on the average, every ten years at Herrnhut, and its regulations are not binding in the province. The foreign missions are managed by a mission board, elected by the General Synod. There is also a standing court of appeal, known as Unity's Elders' Conference, and consisting of the mission board and four provincial boards. In Germany all its members are in the hands of the eyes of the law. In Germany the official title of the Church is Evangelische Brüder-Unität; in Austria, Evangelische Brüder-Kirche; in England and America Moravian Church.

II. Doctrine.—At the last General Synod (1909) they repeated their old fundamental principle that "the Holy Scriptures are our only rule of faith and practice"; but at the same time they declared that their interpretation of Scripture agreed substantially with the Nicene Creed, the Westminster and Augsburg Confessions, and the Thirty-nine Articles. Since 1879 their leading doctrines have been formulated as follows: (1) the total depravity of man; (2) the real Godhead and real humanity of Christ; (3) justification and redemption through the sacrifice of Christ; (4) work of the Holy Spirit; (5) good works as fruits of the Spirit; (6) fellowship of believers; (7) second coming of Christ; (8) resurrection of the dead to life or judgment.

IV. Ceremonies.—At morning worship the service consists of a litany, scripture lessons, sermon, singing, ex tempore prayer. At the evening service the Lord's Supper is celebrated once a month. Infant Baptism is practiced. There are three modes of admission to membership: in the case of the baptized, adult baptism (not immersion); in the case of the non-baptized, admission by reception. Members from other Churches are generally admitted by reception.

V. Church Policy.—It is now held by some Moravians that their Church is a via media between Anglicanism and Dissent. At last meeting of the Lambeth Conference (1907) some overtures, on certain conditions, were made for (a) joint consecration of bishops, (b) joint ordination of ministers, (c) interchange of pulpits. In reply Mr. Moray (1909), with the consent of his Provincial Synod, felt able to make a generous offer, but also that their wish (a) to preserve their independence as a "Protestant Episcopal Church"; (b) to co-operate freely; as heretofore with other Evangelical Churches. On this question negotiations are still in progress.
Bruce's claims by addressing him as king of Scotland. In the spring of 1326 he was again in France, when he concluded an offensive and defensive alliance between France and Scotland. The death of Bruce in 1329 made Moray regent of Scotland and guardian of the young king David II. In accordance with enactments made by the Scottish parliaments of 1315 and 1318. He died at Musselburgh on the 20th of July 1332, while preparing to resist an invasion by the English barons. Allegations of poisoning are made both by Barbour and Wyntoun, but without substantial grounds.

Moray married Isabel, daughter of Sir John Stewart of Bonkyl. His son Thomas, the 2nd earl, was killed at the battle of Dupplin in 1332; his second son John, the 3rd earl, was killed at Neville's Cross in 1346. The earldom then became extinct and the estates passed to their sister Agnes (c. 1312-1360), countess of Dunbar and March, known as 'Black Agnes,' and celebrated for her gallant defence of Dunbar Castle in 1337 and 1338. (See MARCH, EARLS OF.)

MORBIANJ, or Mayurbhanj, a native state of India, in the Orissa division of Bengal. Area 4243 sq. m.; pop. (1901), 610,383, showing an increase of 147.7% in the preceding decade; revenue, £64,000. It contains a large proportion of mountain and forest, where wild elephants are numerous, and also some of the richest iron ores in India. The capital is Bhubaneswar. (pop. 5613), which is connected by a narrow-gauge line with the Bengal-Nagpur railway.

MORBIAH, an administrative department of western France on the Atlantic seaboard, formed of part of Lower Brittany, and bounded S.E. by the department of Loire-Inférieure, E. by that of Ille-et-Vilaine, N. by Côtes-du-Nord, and W. by Finistère. Area, 2738 sq. m. Pop. (1906), 573,132. From the Montagnes Noires on the northern frontier the western portion of Morbihan slopes southward towards the Atlantic, being watered by the Ilé, the Blavet with its affluent the Scorff, and the Auray; the eastern portion, on the other hand, dips towards the south-east in the direction of the course of the Oust and its feeders, which fall into the Vilaine. Though the Montagnes Noires contain the highest point (974 ft.) in the department, the most striking orographic feature of Morbihan is the dreary, treeless, streamless tract of moorland and marsh known as the Landes of Lanvaux, which extends (W.N.W. to E.S.E.) with a width of from 1 to 3 miles for a distance of 31 miles between the valley of the Clafe and that of the Arz (affluents of the Oust). A striking contrast to this district is afforded by the various inlets of the sea, whose shores are clothed with vegetation of exceptional richness, large fig-trees, rose-laurels, and aloes growing as if in Africa. The coastal line is exceedingly irregular, both on the coast of the Vilaine, the peninsula of Ruis, the great gulf of Morbihan (Inner Sea), from which the department takes its name, and the mouth of the Auray, the long Quiberon peninsula attached to the mainland by the narrow isthmus of Fort Penthèvre, the deep-branched estuary of Estel, the mouths of the Blavet and the Scorff uniting to form the port of Lorient, and, finally, on the borders of Finistère the mouth of the Laita, follow each other in rapid succession. Off the coast lie the islands of Groix, Belle-Île (q.v.), Houat and Hoedic. Vessels drawing 13 ft. can ascend the Vilaine and the Blavet; the Blavet, having a shallow course through the department; and the Oust, as part of the canal from Nantes to Brest, forms a great waterway by Redon, Josselin, Rohan and Pontivy. The climate of Morbihan is characterized by great moisture and mildness. Unproductive heath occupies more than a quarter of the department, about a third of which is arable land. Rye, buckwheat and wheat, potatoes and mangels are the chief crops; hemp and flax are also grown. Horned cattle are the chief livestock and beekeeping is extensively practised. The sea-ware gathered along the coast helps greatly to improve the soil of the region bordering thereon. Outside of Lorient (q.v.), a centre for naval construction, there is little industrial activity in Morbihan. The catching and curing of sardines and the breeding of oysters (Auray, St. Armel, &c.) form the business of many of the inhabitants of the coast, who also fish for anchovies, lobsters, &c., for tinning.

The forges of Hennebont are of some importance for the production of sheet-lead.

The department is served by the Orleans railway. It is divided into four arrondissements—Vannes, Lorient, Ploermel and Pontivy—with 35 cantons and 256 communes. The capital Vannes is the seat of an bishops of Lorient, also well known for their megalithic remains; Elven, with two towers of the 15th century, remains of an old stronghold; Josselin which has the fine château of the Rohan family and a church containing the tombs of the (13th), Olivier de Clisson and his wife; Guern with a chapel of the 15th and 16th centuries and the Feuquié with a chapel of the 15th century; Quiberon, which is associated with the disaster of the French émigrés in 1795; Sarzeau, near which is the fortress of Suscinio (13th and 15th centuries); Ste Barbe with a chapel, dating from about the end of the 15th century, finely situated, overlooking the Ile; St Gildas-de-Rhuys, with a ruined Romanesque church and other remains of a Benedictine abbey of which Abelard was for a time abbot. The principal parades (religious festivals) of the department are those of Ste-Avoye, Auray and St Nicolas-des-Eaux.

MORCAR, EARL (fl. 1066), son of Earl Elfgar, brother of Edwin, earl of the Mercians. They assisted the Northumbrians to expel Tostig, of the house of Godwin, in 1065 and Morcar was chosen earl by the rebels. Harold, Tostig's brother, consented to this extension of the power of the Mercian house. In spite of this concession, and the help which he gave them against Tostig and Harold Hardrada, the two brothers left him to fight alone at Hastings. After trying to secure the crown for their own house, they submitted to William, but lost their earldoms. They attempted to raise the North in 1068, and failed ignominiously. They were pardoned, but Morcar afterwards joined Hereward in the Isle of Ely (1191), while Edwin perished in attempting to raise a Welsh rebellion. Morcar died in prison; at what date is unknown.

See E. A. Freeman, Norman Conquest and William Rufus, vol. i.

MORDECAI BEN HILLEL, a German rabbi, who died as a martyr at Nuremberg in 1298. His great legal (Halachic) work is usually cited as "the Mordecai," and its value consists in its thorough use of the medieval authorities. It acquired wide authority, and was one of the sources of the Code of Joseph Caro. Mordecai was also the author of Responsa.

MORDVINS, otherwise called MORDVA, MORDVS, or MORDVINS, a people numbering about one million, belonging to the Ural-Altaic family, who inhabit the middle Volga provinces of Russia and spread in small detached communities to the south and east of these. Their settlement in the basin of the Volga is of high antiquity. One of the two great branches into which they are divided, the Erzya, is perhaps the same as the Aroses mentioned by Strabo as dwelling between the Baltic Sea and the Ural Mountains. Strabo mentions also the Aroses as inhabitants of the country between the Don, the Caspian Sea and the Caucasus. The Russians made raids on the Mordvins in the 12th century, and after the fall of Kazan rapidly invaded and colonized their country.

The Mordvins are now found in the governments of Simbirsk, Penza, Samara and Nizhni-Novgorod, as well as Saratov and Tambov. But their villages are dispersed among those of the Russians, and they constitute only 10 to 12% of the population in the four first-named governments, and from 5 to 6% in the last two. They are unusually distributed over this area in ethnographical islands, and constitute as much as 23 to 44% of the population of several districts of the governments of Tambov, Simbirsk, Samara and Saratov, and only 2 or 3% in other districts of the same provinces. They are divided into two great
branches, the Erza (Erza, or Erza) and the Moksha, differing somewhat in their physical features and language. The southern branch, or the Moushya, have a darker skin and darker eyes and hair than the northern. A third branch, the Karatays, found in Kazan, appears to be mixed with Tartars. The language is a branch of the Western Finnish family, and most nearly allied to the Cheremissian, though presenting many peculiarities (see Finno-UgriC). The Mordvins have largely abandoned their own language for Russian; but they have maintained a good deal of their old national dress, especially the women, whose profusely embroidered skirts, original hair-dress large ear-rings which sometimes are merely hare-tails, and numerous necklaces covering also, especially the thing of all possible ornaments, easily distinguish them from Russian. They have dark hair, but blue eyes, generally small and rather narrow. Their cephalic index is very near to that of the Finns. They are brachycephalous or sub-brachycephalous, and a few are mesaticephalous. They are finely built, rather tall and strong, and broad-chested. Their chief occupation is agriculture; they work harder and (in the basin of the Moksha) are more prosperous than their Russian neighbours. Their capacities as carpenters were well known in Old Russia, and Ivan the Terrible used them to build bridges and clear forests during his advance on Kazan. They have no tendency to mercantile pursuits. They are good sailors, and also masters of apiculture, and the commonwealth of bees often appears in their poetry and religious beliefs. They have a considerable literature of popular songs and legends, some of them recounting the doings of a king Tushyian who lived in the time of Ivan the Terrible. Nearly all are Christians; they received baptism in the reign of Elizabeth, and the Nonconformists have made many proselytes among them. But they still preserve much of their own mythology, which they have adapted to the Christian religion. According to some authorities, they have preserved also, especially the thing of all possible kinds of Russian, the practice of kidnapping brides, with the usual battles between the party of the bridegroom and that of the family of the bride. The worship of trees, water (especially of the water-divinity which favours marriage), the sun or Shkay, who is the chief divinity, the moon, the thunder and the frost, and of the home-divinity Kardaz-serko still exists among them; and a small stone altar or flat stone covering a small pit to receive the blood of slaughtered animals can be found in many houses. Their burial customs seem founded on ancestor-worship. On the forty-fifth day after the death of akinsman the dead is not only supposed to return home but a member of his family represents him, and, coming from the grave, speaks in his name.

The language is treated of in Ahlquist's Versuch einer Moksha-mordvinischen Grammatik nebst Texten und Wörter-Verzeichiss (St Petersburg, 1861), and their history, customs and religion by Smirnov (trans. by Bower), Les Populations финноязычные de la Volga (in Pupulations de l'école des langues orientales, vivantes, 1898). Much valuable information respecting customs, religion, language and folk-lore will be found in papers by Paasonen, Heikilä, Ahlquist, Mainef and others printed in the Journal de la Société Finno-Ougrienne and the Finnisch-ugrische Forschungen.

MORE, HANNAH (1745-1833), English religious writer, was born at Stapleton, near Bristol, on the 2nd of February 1745. She may be said to have made three reputations in the course of her long life: first, as a clever verse-writer and witty talker in the circle of Johnson, Reynolds and Garrick; next, as a writer on moral and religious subjects on the Puritanic side; and lastly, as a practical philanthropist. She was the youngest but one of the five daughters of Jacob More, who, though a member of a Presbyterian family in Norfolk, had become a member of the English Church and a strong Tory. He taught a school at Stapleton in Gloucestershire. The elder sisters established a boarding-school at Bristol, and Hannah became one of their pupils when she was twelve years old. Her first literary efforts were pastoral plays, suitable for young ladies to act, the first being written in 1762 under the title of A Search after Happiness (2nd ed. 1773). Metastasio was one of her literary models; on his opera of Afitho regulo she based a drama, The Inflexible Captive, published in 1774. She gave up her share in the school in view of an engagement of marriage she had contracted with a Mr Turner. The wedding never took place, and, after much reluctance, Hannah More was induced to accept from Mr Turner an annuity which had been settled on her without her knowledge. This set her free for literary pursuits, and in 1772 or 1773 she went to London. Some verses on Garrick's Lear led to an acquaintance with the actor-playwright; Miss More was taken up by Elizabeth Montague; and her unaffected enthusiasm, simplicity, vivacity, and wit won the hearts of the whole Johnson set, the lexicographer himself included, although he is said to have told her that she should "consider what her flattery was worth before she chocked him with it." Garrick wrote the prologue and epilogue for his tragedy Percy, which was acted with great success at the Covent Garden Theatre. They had to be printed and were found in 1779 after Garrick's death, was less successful. The Garricks had induced her to live with them; and after Garrick's death she remained with his wife, first at Hampton Court, and then in the Adelphi. In 1781 she made the acquaintance of Horace Walpole, and corresponded with him from that time. At Bristol she discovered a poetess in Mrs Anne Yearsley (1755-1800), a milkwoman, and raised a considerable sum of money for her benefit. "Lactilla," as Mrs Yearsley was called, wished to use the capital, and made insinuations against Miss More, who desired her home with her. The trust was handed over to a Bristol merchant and eventually to the poetess.

Hannah More published Sacred Dramas in 1782, and it rapidly ran through nineteen editions. These and the poems Bas-Bleu and Florio (1786) mark her gradual transition to more serious views of life, which were fully expressed in prose in her Thoughts on the Importance of the Manners of the Great to General Society (1788), and An Estimate of the Religion of the Fashionable World (1790). She was intimate with Wilberforce and Zachary Macaulay, with whose evangelical views she was in entire sympathy. She published a poem on Slavery in 1788. In 1785 she bought a house, at Cowslip Green, near Wrington, near Bristol, where she settled down to country life with her sister Martha, and wrote many ethical books and tracts: Strictures on Female Education (1790), Hints towards forming the Character of a Young Princess (1803), Coeloes in Search of a Wife (only nominally a story, 1809), Practical Piety (1811), Christian Morals (1813), Character of St Paul (1815), Moral Sketches (1819). The tone is unbroken throughout; the language fresh and a little will-o'-wisp-like; the main object being to reform the minor self-indulgences and infirmities. She was a rapid writer, and her work is consequently discursive and formless; but there was an originality and force in her way of putting commonplace sober sense and piety that fully accounts for her extraordinary popularity. The most famous of her books was Coeloes in Search of a Wife, which had an enormous circulation among pious people. Sydney Smith attacked it with violence in the Edinburgh Review for its general priggishness. It is interesting to note that the model Stanley children have been said to be drawn from T. B. Macaulay and his sister. She also wrote many spirited rhymes and prose tales, the earliest of which was Village Politics (1792), by "Will Chip," to counteract the doctrines of Tom Paine and the influence of the French Revolution. The success of Village Politics induced her to begin the series of "Cheap Repository Tracts," which were for three years produced by Hannah and her sisters at the rate of three a month. Perhaps the most famous of these is The Shepherd of Salisbury Plain, describing a family of phenomenal frugality and contentment. This was translated into several languages. Two million copies of these rapid and telling sketches were circulated in one year, teaching the poor in rhetoric of most ingenious homeliness to rely upon the virtues of content, sobriety, humility, industry, reverence for the British Constitution, hatred of the French, trust in God and in the kindness of the gentry.

Perhaps the best proof of Hannah More's sterling worth was her indefatigable philanthropic work—her long-continued exertions to improve the condition of the children in the mining districts of the Mendip Hills near her home at Cowslip Green and Barley Wood. The More sisters met with a good deal of
opposition in their good works. The farmers thought that education, even to the limited extent of learning to read, would be fatal to agriculture, and the clergy, whose neglect she was making good, accused her of Methodist tendencies. In her old age, philanthropists from all parts made pilgrimages to the bright and amiable old lady, and she returned them all her favours till within two years of her death. The last five years of her life were spent, on the 7th of September 1833.

MORE, HENRY (1614-1687), English philosopher of the Cambridge Platonist school, was born at Grantham in 1614. Both his father and his mother, he tells us, were "earnest followers of Calvin," but he himself "could never swallow that hard doctrine." In 1631 he was admitted at Christ's College, Cambridge, about the time Milton was leaving it. He immersed himself "over head and ears in the study of philosophy," and fell for a time into a scepticism, from which he was delivered by a study of the "Platonic writers." He was fascinated especially by Neoplatonism, and this fascination never left him. The Theologia germanica also exerted a permanent influence over him. He took his bachelor's degree in 1635, his master's degree in 1639, and immediately afterwards was chosen fellow of his college. All other preceptmen he refused, with one exception. Fifteen years after the Restoration he accepted a prebend in Gloucester Cathedral, but only to resign it in favour of his friend Dr Edward Fowler, afterwards bishop of Gloucester. He would not accept the mastership of his college, to which, it is understood, he would have preferred in 1654, when Cudworth was appointed. He drew around him many young men of a refined and thoughtful turn of mind, but among all his pupils the most interesting was a young lady of noble family. This lady, probably a sister of Lord Finch, subsequently earl of Nottingham, a well-known statesman of the Restoration, afterwards became Lady Conway, and at her country seat at Ragley in Warwickshire More continued at intervals to spend "a considerable part of his time." She and her husband both appreciated him, and amidst the woods of this retreat he composed several of his books. The spiritual enthusiasm of Lady Conway was a considerable factor in some of More's speculations, none the less that she at length joined the Quakers. See also the friendship of Mary of Pury and Penn, but of Baron van Helmont and Valentine Greatrakes, mystical theaumaturgists of the 17th century. Ragley became a centre not only of devotion but of wonder-working spiritualism.¹ From this, his genius suffered, and the rationality which distinguishes his earlier is much less conspicuous in his later works. He was a voluminous writer both in verse and in prose, but his works, except the Divine Dialogues (1688), are now of little interest. This treatise, animated and sometimes brilliant, is valuable for modern readers in that it condenses his general view of philosophy and religion.

Henry More represents the mystical and theosophic side of the Cambridge movement. The Neoplatonic extravagances which lay hidden in the school from the first came in his writings to a head, and merged in pure phantasm. He can never be spoken of, however, save as a spiritual genius and a significant figure in British philosophy, less robust and in some respects less learned than Cudworth, but more interesting and fertile in thought, and more genial in character. From youth to age he describes himself as gifted with a buoyant temper. His own thoughts were to some extent a never ceasing source of pleasurable excitement. This mystical elevation was the chief feature of his character, a certain ¹The place and its religious marvels are glanced at in the romance of John Inglesant (ch. xvi.).

radiance of thought which carried him beyond the common life without raising him to any artificial height, for his humility and charity were not less conspicuous than his piety. The last ten years of his life he spent on Ouseley, near Huntingdon. He died October 1687, and was buried in the chapel of the college he loved.

Before his death More issued complete editions of his works, his Opera theologica in 1675, and his Opera philosophica in 1678. The chief authorities for his life are Ward's Life (1710); the prefaire-generallissima prefixed to his Opera omnia (1679); and also a personal account of the philosopher and source of his influence. Apology published in 1664. The collection of his Philosophical Poems (1647), in which he has "compared his chief speculations and experiences," should also be consulted. An elaborated analysis of his works and works of his school in Helmont's Rational Theology, vol. ii. (1874); see also R. Zimmermann. Henry More and die vierre Dimension des Raums (Vienna, 1881). (For his ethical theory, as contained in the Enchiridion Ethicum, see Ethics.)

MORE, SIR THOMAS (1478-1555), English lord chancellor, and author of Utopia, was born in Milk Street in the city of London, on the 7th of February 1478. He received the rudiments of education at St Anthony's School in Threadneedle Street, at that time under More's father, who intended his son to be the best in the city. He was early placed in the household of Cardinal Morton, archbishop of Canterbury. Admission to the cardinal's family was esteemed a high privilege, and was sought as a school of manners and as an introduction to the world by the sons of the best families in the kingdom. Young Thomas More obtained admission through the influence of his father, Sir Thomas, then a rising barrister and afterwards a justice of the court of king's bench. The usual prognostication of future distinction is attributed in the case of More to Cardinal Morton, "who would often tell the nobles sitting at table with him, that in the first place Thomas More was destined on him, whosoever lived to try it shall see this child prove a notable and rare man." At the proper age young More was sent to Oxford, where he is said vaguely to have had Colet, Grocyn and Linacre for his tutors. All More himself says is that he had Linacre for his master in Greek. Learning Greek was not the matter of course which it has since become. Greek was not as yet part of the arts curriculum, and to learn it voluntarily was still looked upon by the authorities. Those who did so were suspected of an inclination towards novel and dangerous modes of thinking, then rife on the Continent and slowly finding their way to England. After a term in his own profession, took the alarm; he removed him from the university without a degree, and entered him at New Inn to commence at once the study of the law. After completing a two-years' course in New Inn, an inn of chancery, More was admitted in February 1496 at Lincoln's Inn, an inn of court. At that time the Inns of Court and Chancery presented the discipline of a well-constituted university, and, through professors under the name of readers and exercises under the name of mootings, law was systematically taught "(Campbell). In his professional studies More early distinguished himself, so that he was appointed reader-in-law in Furnival's Inn; but he would not relinquish the studies which had attracted him in Oxford. We find him delivering a lecture to audiences of all the chief learned of the city of London." The subject he chose was a compromise between theology and the humanities, being St Augustine's De civitate. In this lecture More sought less to expound the theology of his author than to set forth the philosophical and historical contents of the treatise. The lecture-room was a church, St Lawrence Jewry, placed at his disposal by Grocyn, the rector.

Some were about this period of More's life two things happened which gave in opposite directions the determining impulse to his future career. More's was one of those highly susceptible natures which take more readily and more eagerly than common minds the impress of that which they encounter on their first contact with men. Two principal forms of thought and feeling were at this date in conflict, rather unconscious than declared, on English soil. Under the denomination of the "old learning," the sentiment of the middle ages and the idea of Church authority was

¹Life by B. R. ²Ibid. ³Roper, Life.
established and in full possession of the religious houses, the universities, and the learned professions. The foe that was advancing in the opposite direction, though without the conscience of a hostile purpose, was the new power of human reason animated with the revived sentiment of classicism. In More's mind both these hostile influences found a congenial home. Each had its turn of supremacy, and in his early years it seemed as if the humanistic influence would gain the final victory. About the age of twenty he was seized with a violent access of devotional rapture. He took a disgust to the world and its occupations, and experienced a longing to give himself over to an ascetic life. He took a lodging near the Charterhouse, and subjected himself to the discipline of a Carthusian monk. He wore a sharp shirt of hair next his skin, scourged himself every Friday and other fasting days, lay upon the bare ground with a log under his head, and abjured himself for two hours' sleep. This access of the ascetic malady lasted but a short time, and More recovered to all outward appearance his balance of mind. For the moment the balance of his faculties seemed to be restored by a revival of the antagonistic sentiment of humanism which he had imbibed from the Oxford circle of friends, and specially from Erasmus. The dates as regards More's early life are uncertain, and we can only say that it is possible that the acquaintance with Erasmus might have begun during Erasmus's first visit to England in 1499. Tradition has dramatized their first meeting into the story given by Cresacre More—say that the two happened to sit opposite each other at the lord mayor's table, that they went into an argument during dinner, and that, in mutual astonishment at each other's wit and readiness, Erasmus exclaimed, "Aut tu es Morus, aut nullus!" and the other replied, "Aut tu es Erasmus, aut diabolus!" Rejecting this legend, which bears the stamp of fiction upon its face, we have certain evidence of acquaintance between the two men in a letter of Erasmus, with the date "Oxford, 29th October 1499." If we must admit the correctness of the date of Ep. 14 in the collection of Erasmus's Epistolae, we should have to assume that their acquaintance had begun as early as 1497. It rapidly ripened into warm attachment. This contact with the prince of letters revived in More the spirit of the "new learning," and he returned with ardour to the study of Greek, which had been begun at Oxford. The humanistic influence was sufficiently strong to save him from wrecking his life in monkish mortification, and even to keep him for a time on the side of the party of progress. He acquired no inconsiderable facility in the Greek language, from which he made and published some translations. His Latin style, though wanting the inimitable ease of Erasmus and often offending against idiom, is yet in copiousness and propriety of diction above the ordinary Latin of the English scholars of his time.

More's attention to the new studies was always subordinate to his resolution to rise in his profession, in which he was stimulated by his father's example. As early as 1502 he was appointed under-sheriff of the city of London, an office then judicial and of considerable dignity. He first attracted public attention by his conduct in the parliament of 1504, by his daring opposition to the king's demand for money. Henry VII. was entitled, according to feudal laws, to a grant on occasion of his daughter's marriage. But the king of France had made him a generous present of 20,000 crowns, thereby he intended to give with his daughter. The members, unwilling as they were to vote the money, were afraid to offend the king, till the silence was broken by More, whose speech is said to have moved the house to reduce the subsidy of three fifteenths which the Government had demanded to £10,000. One of the chamberlains went and told his master that he had been thwarted by a beardless boy. Henry never forgave the audacity; but, for the moment, the only revenge he could take was upon More's father, whom upon some pretext he threw into the Tower, and he only released him upon payment of a fine of £100. Thomas More even found it advisable to withdraw from public life into obscurity. During this period of retirement the old dilemma recurred. One while he devoted himself to the sciences, "perfecting himself in music, arithmetic, geometry and astronomy, learning the French tongue, and recreating his tired spirits on the viol," or translating epigrams from the Greek anthology; another while resolving to take priest's orders.

From dreams of clerical celibacy he was roused by making acquaintance with the family of John Colt of New Hall, in Essex. The "honest and sweet conversation" of the three daughters of this family attracted him, and when he decided to prefer the second he married the eldest, Jane, in 1505, not liking to put the affront upon her of passing her over in favour of her younger sister. The death of the old king in 1509 restored him to the practice of his profession, and to that public career for which his abilities specially fitted him. From this time there was scarce a cause of importance in which he was not engaged. His professional income amounted to £400 a year, equal to £4000 in present money, and, "considering the relative profits of the law and the value of money, probably indicated as high a station as £110,000 at the present day" (Campbell). It was not long before he attracted the attention of the young king and of Wolsey. The spirit with which he pleaded before the Star Chamber in a case of The Crown v. The Pope recommended him to the royal favour, and marked him out for employment. More obtained in this case judgment against the Crown. Henry, who was present in person at the trial, had the good sense not to resent the defeat, but took the counsel to whose advocacy it was due into his service. In 1514 More was made member of the council, knighted, and sworn a member of the privy council. He was repeatedly employed on embassies to the Low Countries, and was for a long time stationed at Calais as agent in the shifty negotiations carried on by Wolsey with the court of France. In 1519 he was compelled to resign his post of under-sheriff to the city and his private practice at the bar. In 1521 he was appointed treasurer of the exchequer, and in the parliament of 1523 he was elected Speaker. The choice of this officer rested nominally with the house itself, but in practice was always dictated by the court. Sir Thomas More was pitched upon by the court on this occasion in order that his popularity with the Commons might be employed to carry the money grant for which Wolsey asked. To the great disappointment of the court More remained firm to the popular cause, and it was greatly owing to his influence that its demands were resisted. From this occurrence may be dated the jealousy which the cardinal began to exhibit towards More. Wolsey made an attempt to get him out of the way by sending him as ambassador to Spain. More defeated the design by a personal appeal to the king, alleging that the climate would be fatal to his health. In 1524 Henry VIII. had made a marriage with Anne Boleyn, who was already looking round for a more popular successor to Wolsey, made the gracious answer that he would employ More otherwise. In 1525 More was appointed chancellor of the duchy of Lancaster, and no pains were spared to attach him to the court. The king frequently sent for him into his closet, and discoursed with him on astronomy, geometry and points of divinity. This growing favour, by which many men would have been carried away, did not impose upon More. He discouraged the king's advances, showed reluctance to go to the palace, and seemed constrained when there. Then the king began to give himself to More's house at Chelsea, and would dine with him without previous notice. William Roper, husband of More's eldest daughter, mentions one of these visits, when the king after dinner walked in the garden by the space of an hour holding his arm round More's neck. Roper afterwards congratulated his father-in-law on the distinguished honour which had been shown him. "I thank our Lord," was the reply, "I find his grace my very good lord indeed; and I believe he doth as singularly favour me as any subject within this realm. Howbeit, son Roper, I tell thee, I have no cause for so much joy, for if my head would win him a castle in France it should not fail to go." As a last resource More tried the expedient of silence, disembiling his wit and affecting to be dull. This had the desired effect so far that he was less often sent for. But it did not alter the royal policy, and in 1529, when a successor had to be

2. Roper, Life.
found for Wolsey, More was raised to the chancellorship. The selection was justified by More's high reputation, but it was also significant of the modification which the policy of the court was then undergoing. It was a concession to the rising popular party, to which it was supposed that More's politics inclined him. The public favour with which his appointment had been received was justified by his conduct as judge in the court of chancery. Having heard causes in the forenoon between eight and eleven, after dinner he sat again to receive petitions. The manner the supplicant was the more abjectly he would speak to him and the more needlessly he would despatch his case. In this respect he formed a great contrast to his predecessor, whose aces he soon cleared off. One morning telling by the officer that there was not another case before the court, he ordered the fact to be entered on record, as it had never happened before. He not only refused all gifts—such as had been usual—himself, but took measures to prevent any of his connexions from interfering with the course of justice. One of his sons-in-law, Heron, having a suit in the chancellor's court, and refusing to agree to any reductio, the chancellor, being not the man was the most affectionate father to his children that ever was in the world," More thereupon made a decree against him. Unfortunately for Sir Thomas More, a lord chancellor is not merely a judge, but has high political functions to perform. In raising More to that eminent position, the king had not merely considered his professional distinction but had counted upon his avowed liberal and reforming tendencies. In the Utopia, which, though written earlier, More had allowed to be printed as late as 1516, he had spoken against the vices of power, and declared for indifference of religious creed with a breadth of philosophical view of which there is no other example in any Englishman of that age. At the same time, as he could not be suspected of any sympathy with Lutheran or Wickliffite heretics, he might fairly be regarded as qualified to lead the party which aimed at reform in State and Church within the limits of Catholic orthodoxy. But in the king's mind the public questions of reform were entirely sunk in the personal one of the divorce. The divorce was a point upon which Sir Thomas would not yield. And, as he saw that the marriage with Anne Boleyn was determined upon, he petitioned the king to be allowed to resign the Great Seal, alleging failing health. With much reluctance the royal permission was given and the resignation accepted, on the 10th of May 1532, with many gracious expressions of goodwill on the part of the king. The promise held out of future bounty was never fulfilled, and More left office, as he had entered it, a poor man. His necessitous condition was so notorious that the clergy in convocation voted him a present of £3000. This he peremptorily refused, either for himself or for his family, declaring that he "had rather see it all cast into the Thames." Yet the whole of his income after resigning office did not exceed £100 a year. Hitherto he had maintained a large establishment, not on the princely scale of Wolsey, but in the patriarchal fashion of having all his sons-in-law, with their families, under his roof. When he resigned the chancellorship he called his children and grandchildren together to explain his reduced circumstances. "If we wish to live together," said he, "you must be content to be contributory together. But my counsel is that we fail not to the lowest fare first: we will not, therefore, descend to Oxford fare, nor to the fare of New Inn, but we will begin with Lincoln's Inn diet, where many right worshipful men of great account and good years do live full well; which if we find ourselves the first year not able to maintain, then we will in the next year come down to Oxford fare, where many great learned and ancient fathers and doctors are continually conversant; while if our purses stretch not to maintain neither, then may we after, with bag and wallet, go a-begging together, hoping that for pity some good folks will give us their charity." More was now able, as he writes to Erasmus, to return to the life which had always been his ambition, when, free from business and public affairs, he might give himself up to his favourite studies and to the practices of his devotion. Of the Chelsea interior Erasmus has drawn a charming picture, which may vie with Holbein's celebrated canvas, "The Household of Sir Thomas More." "More has built, near London, upon the Thames, a modest yet commodious mansion. There he lives surrounded by his numerous families including his wife, his son, and his son's wife, his three daughters and their husbands, with eleven granddaughters. There is not any man living so affectionate to his children as he, and he loves them all with a peculiar fondness. A general run of the Parnell was, forward in proportion of his disposition that whatsoever happened that could not be helped, it was a cheerful and as well pleased as though the best thing possible had been done. In More's house you would see that Dr. Bunting's Academy was received again only. Here in the Academy the discussions turned upon geometry and the power of numbers, the house at Chelsea is a veritable school of Christian religion. In it is none, man woman, but readeth or studiueth the liberal arts, yet is their chief care of piety. There is never a seen idle; the head of the house governs it not by a lofty carriage and oft rebukes, but by gentleness and amiable manners. Every member is busy in his place, performing his duty with alacrity; nor is sober mirth wanting." But More was too conspicuous to be long allowed to enjoy the happiness of a retired life. A special invitation was sent him by the king to attend the coronation of Anne Boleyn, accompanied with the gracious offer of £20 to buy a new suit for the occasion! More refused to attend, and from that moment was marked out for vengeance. A first attempt made to bring him within the meshes of the law only recoiled with shame upon the head of the accusers. They were maladroit enough to attack him on his least vulnerable side, summoning him before the privy council to answer to a charge of receiving bribes in the administrative matters of justice. With the usual alacrity he went forward in compliance of a decree pronounced against him in favour of the contending party Vaughan, who he said had presented a gift cu to the chancellor. More stated that he had received a cup as a New Year's gift. Lord Wiltshire, the queen's father, exultingly cried out, "So, did I not tell you, my lords, that you would find this matter true?" "But, my lords," continued More, "having pledged Mrs Vaughan in the wine wherewith my butler had filled the cup, I restored the cup to her." Two other charges of a like nature were refuted as triumphantly. But the very futility of the accusations must have betrayed to More the bitter determination of his enemies to compass his destruction. Foiled in their first ill-directed attempt, they were compelled to have recourse to that tremendous engine of regal tyranny, the law of treason. A bill was brought into parliament to attain Elizabeth Barton, a nun, who was said to have held treasonable language. Barton turned out afterwards to have been an impostor, but she had duped More, who now lived in a superstitious atmosphere of convents and churches, and he had given his countenance to her supernatural pretensions. His name, with that of Fisher, was accordingly included in the bill as an accomplice of justice. When he came before the council it was at once apparent that the charge of treason could not be sustained, and the efforts of the court agents were directed to draw from More some approbation of the king's marriage. But to this neither calmer nor threats could move him. The preposterous charge was urged that it was by his advice that the king had submitted himself in his book against Luther to an assertion of the pope's authority, whereby the title of "Defender of the Faith" had been gained, but in reality a sword put into the pope's hand to fight against him. More was able to reply that he was willing of the king's part in a very thing that happened that upon some breach of amity between the Crown of England and the pope Henry's too pronounced assertion of the papal authority might be turned against himself, "therefore it were best that place be amended, and his authority more slenderly touched." "Nay," replied the king, "that it shall not; we are so much bound to the see of Rome that we cannot do too much honour unto it. Whatever impediment be to the contrary, we will set forth that authority to the utmost; for we have received from these see our crown imperial," "which," added More, "till his grace with his own mouth so told me Ep. 426, Appendix.
MORE, SIR THOMAS

I never heard before." Anything more defiant and exasperating than this could not well have been said. But it could not be laid hold of, and the charge of treason being too ridiculous to be proceeded with, More's name was struck out of the bill. When his daughter brought him the news, More calmly said, "I faith, Meg: quod differentur, non afferetur: that which is postponed is not dropped." At another time, having asked his daughter how the court went and how Queen Anne did, he received for answer, "Never better; there is nothing else but dancing and sporting." To this More answered, "Alas, Meg; it pitied me to hear utter such misery, poor soul; she shall shortly come: these dances of hers will prove such dances that she will spurn our heads off like footballs; but it will not be long ere her head will dance the like dance." 1 So the speech runs in the Life by More's great-grandson; but in the only trustworthy record, the life by his son-in-law Roper, More's reply ends with the words, "she will shortly come." In this, as in other instances, the later statement has the appearance of having been an imaginative extension of the earlier.

In 1534 the Act of Supremacy was passed and the oath ordained to this judicial murder was sent for to Lambeth, where he offered to swear to the succession, but not under the authority of the Supremacy as against his conscience. Thereupon he was given in charge to the abbot of Westminster, and, persisting in his refusal, was four days afterwards committed to the Tower. After a close and even cruel confinement (he was denied the use of pen and ink) of more than a year, he was brought to trial before a special commission and a packed jury. Even so More would have been acquitted, when at the last moment Rich, the solicitor-general, quitted the bar and presented himself as a witness for the Crown. Being sworn, he detailed a confidential conversation he had had with the prisoner in the Tower. He affirmed that, having himself admitted in the course of this conversation "that there were things which no parliament could do—e.g. no parliament could make a law that God should not be God," Sir Thomas had replied, "No more could the parliament make the king supreme head of the Church." By this act of perjury a verdict of "guilty" was procured from the jury. The execution of the sentence followed within the week, on the 7th of July 1535. The head was fixed upon London Bridge. The vengeance of Henry was not satisfied by the judicial murder of his friend and servant; he enforced the confiscation of what small property More had left, expelled Lady More from the house at Chelsea, and even set aside assignments which had been legally executed by More, who foresaw what would happen before the commission of the alleged treason. More's property was settled on Princess Elizabeth, afterwards queen, who kept possession of it till her death.

Sir Thomas More was twice married, but had children only by his first wife, who died about 1511. His only son, John, married an heiress, Ann Cresacre, and was the grandfather of Cresacre More, Sir Thomas More's biographer. His eldest daughter, Margaret (1503–1544), married to William Roper (1496–1578), an official of the court of king's bench and a member of parliament under Henry VIII, Edward VI, and Mary, is one of the foremost women in the annals of the country for her virtues, high intelligence and various accomplishments. She read Latin and Greek, was a proficient in music, and in the sciences so far as they were then accessible. Her devotion to her father is historical; she gave him not only the tender affection of a daughter but the high-minded sympathy of a soul great as his own.

He was only a lawyer, a wit, a scholar, and a man of wide general reading; he was also a man of cultivated taste, who delighted in music and painting. He was an intimate friend of Holbein, whose first introduction to England was as a visitor to More in his house at Chelsea, where the painter is said to have remained for three years, and where he probably first met Henry VIII. Holbein painted portraits of Sir Thomas and his family. More was beatiﬁed by Leo XIII. in 1886.

The Epistola ad Dorfium exhibits More emphatically on the side of the new learning. It contains a vindication of the study of Greek, and of the desirability of printing the text of the Greek Testament—views which at that date required an enlightened understanding to enter into, and which were condemned by the party to which More afterwards attached himself. On the other hand, he can at the most be doubtfully excused from the charge of having tortured men and children for heresy. It is admitted by himself that he inflicted punishment for religious opinion. Erasmus only ventures to say in his friend's defence "that while he was chancellor no man was put to death for these pestilent opinions, while so many suffered death in France and the Low Countries." His views and feelings were tracted under the combined inﬂuences of his professional practice and of public employment. In the Utopia, published in Latin in 1516 (1st English translation, 1551), he not only denounced the ordinary vices of power, but evinced an enlightenment of sentiment which went far beyond the most statesmanlike ideas to be found among his contemporaries, pronouncing not merely for toleration, but rising even to the philosophical conception of the indifference of religious creed. It was to this superiority of view, and not merely to the satire on the abuses of the Church and the civilization of the Low Countries, that the Utopia was due for its popularity in the 16th century. For as a romance the Utopia has little interest either of incident or of character. It does not, as has been said, anticipate the economical doctrines of Adam Smith, and much of it is fanciful without being either witty or ingenious. The idea of putting forward political and philosophical principles under the fiction of an ideal state was doubtless taken from Plato's Republic. The Utopia in turn suggested the literary form adopted by Bacon, Hobbes, Filmer, and other later writers; and the name of the book has passed into a language as signifying optimistic but impracticable ideals of reform.

For a bibliography of More's numerous works see the article in the Diet. Nat. Bio., and the Catalogue of the Alfred Cock collection of books and portraits of or relating to Sir Thomas More which is preserved in the Guildhall Library, London. The more important of his works and their editions are here given. E. Lucas, dogmat. .. complutusa ob Erasmo Roterodamo et Thoma Mor... traducta (Paris, 1506 and 1514; Venice, Aldus, 1516, &c.) was accomplished by Erasmus and More in 1505. The Life of John Picus, earle of Mirandula .. printed by Wynkyn de Worde in 1510, translated by More from the Venice ed. of 1498, was edited by J. M. Rigg for the Tudor Library in 1890. Historiae of the pitiful and unfortunate life of Edward the Fifth and the then Duke of York. .. Richard the Third was written by More in 1513, and first printed in a corrupt version in Grafton's continuation of Harding in 1543; it is included by Rastell in his 1557 edition of R. R. History, but was not published before 1558, when it was by Cardinal Morton; as the History of King Richard III. it was edited by J. R. Lumbly for the Pitt Press in 1883. The Libellus vere aureus .. better known as Utopia, was printed at Louvain 1516, and the English version of 1518, and many subsequent editions, many of them of great bibliographical value, the finest being the Basel edition of 1518. It was translated into the chief languages of Europe, and into English by Ralph Robinson as A fruitful and Pleasant Worke of the best State of a Purblyke Weale, and of the new Yle called Utopia (Abraham Nell, 1551); modern editions are by J. Dibdin (2 vols., 1808), Professor A. Culme Sprague (1812), by R. Lumbly for the Pitt Press (1879), by William Morris at the Kelmscott Press (1893). By J. Chrton Collins for the Clarendon Press (1904), by R. Steele for the King's Classics (1908), &c. Other translations of Utopia are by H. Grindal (1564) and J. Burinett (1664), and by A. Caunce (More, 1823). The Apology of Sir Thomas More, kn. .. written in 1528 and printed by John Rastell in 1539; Sir Thomas More's Answer to the yyrte parte of the Poysons'd book. The Souper of the Lorde (William Rastell, 1532) with a "Second Parte" in 1533. The Apologie of Sir Thomas More, written in 1533, is a defence of his own polemical style in the controversy with Erasmus, and against the plea against Tribulation, printed by Rastell in 1533, was destined primarily for More's family.

More's English works were collected by Rastell and published under the title The Works of Sir Thomas More Knight by Cawood, Wyly and Totell in 1557; his Latin works Thomas Mor... Lucubrationes were partially collected at Basel 1563 and in 1566 (occupying 6 large folio volumes); his English works were published at Antwerp, and a Latin translation was published at Leipzig in 1680. Modern selections were edited by W. J. Walter (Baltimore, 1841), by T. E. Bridgett (Wisdom and Wit of Blessed Thomas More, London, 1891). His
correspondence with Erasmus is partly included in the editions of Moreas. In Kénner's Letters and Papers of Henry VIII., the letters written to his family in his last days being found in vol. viii. The Mirror of Virtue: With a Life of Sir Thomas More was written by his son-in-law William Roper after the end of Mary's reign. It was preserved in MS. during the reign of Elizabeth, and handed down in copies, many of which were cut or mutilated, till given as an annuity till 1588; (1886), 1599, (1498) when he translates it. It was also written in Moreas's reign. It is chiefly compiled from Roper and Stapleton. The preface is signed Ro. Ba. (Robert Barnstaple). William Rastell's Life of More, of which the 1st. 2d. & 3d. (1586-1588) were printed at Paris without date, but according to the editor, J. Hunter in 1631. The Life of Sir Thomas More, Lord High Chancellor of England, and with new titles and additions by A. B. Roper, and subsequent biographers as an independent authority. But it is almost entirely borrowed from Roper and Stapleton. The additions made have little importance, and the whole paraphrase of Moreas is ciphers and simple statements. At other times they are decorative miracles. The whole is couched in that strain of devotional exaggeration in which the lives of the saints are usually composed. The author seems to imply that he had received supernatural communications from the spirit of his ancestor. Already, only eighty years after More's execution, hagiography had taken possession of the facts and was transmitting them into an edifying legend. Creasy's Life of More, a revision of which is not otherwise vouched. It has been remarked by Hunter that More's life and works have been all along manipulated for political purposes, and in later times (1850) in the Pope's interest. But More's own Catholic reaction, Roper and Stapleton wrote lives of him; Ellis Heywood dedicated his II Moro (Florence, 1556) a fanciful account of More's life at Chelsea, to Cardinal Pole, and Tottell republished the fable of his English works. Stapleton prepared his Tres Thomae in 1588, when the recovery of England to the see of Rome was looked for by the Spanish Invasion. In 1599, there was a prospect of a disputed succession, the anonymous Life by Ro. Ba was composed; and soon after Charles had allied himself with a Catholic, the Life by Cresacre More famed from the press. Hunter might have added that Stapleton was being reprinted at Grazt at the time when this was written and the later lives by G. T. Rudhart Thomas Moreus, aus den Quellen bearbeitet (Nuremberg, 1859), by J. H. Bridgwood, Life and Writings of Sir Thomas More (1883); W. H. Holland, Life and Writings of Sir Thomas More (1861). Other lives are by J. Hoddesdon (London, 1652, 1662); by Sir A. Cayley (London, 1808); by Sir J. Mackintosh, London (1862), and in Madame de Staël's (London, 1843); by Lord Campbell in Lives of the Chancellors (vol. 1, 1848–1850); by D. Nisard in Renaissance et Réforme (Paris, 1855); by Baumberg (Freiburg, 1799); by F. Seebold in the Oxford Reformers of Life (London, 1867). A biographical study on More's Latin poems is Philomorus, by J. H. Marsden (2nd ed., London, 1878). See also John Bruce, "Inedited documents rel. to the imprisonment and confinement of Sir Thomas More at Oxford," in the Transactions of the Worcestershire Archaeological and Historical Society, Sir Thomas More, or Colloquies on the Progress and Prospects of Society (London, 1829); Anne Manning, The Household of Sir Thomas More (1853, reprinted in King's Novels, 1906); S. Lee, Great Englishmen of the Sixteenth Century (1904). The tragedy of Sir Thomas More, edited by A. Dyce for the Shakespeare Society in 1844, and connected with some commentators with Shakespeare, was written about 1590, and therefore gives a nearly contemporary view of the playwright. James Kirk also wrote a career the subject of a play by J. F. Moréas, Jean (1836–1910), French poet, born at Athens on the 13th of April 1836, was the grandson of Papadimontepoulos, one of the heroes of Missolonghi. He was one of the leaders of the symbolist movement in French poetry, advocating a relaxation of the stringent rules governing French verse; but his early volumes of poems, Les Syriehes (1854), Les Cantillies (1850), and Le Pèlerin passionné (1850) won recognition beyond the limits of this school. In the XIXe siècle (August 11, 1853) he formulated the principles of the symbolists, defending them from the appellation of "decadent," and in the literary supplement of the Figaro (Sep 18, 1856) published a manifesto of the "Jean and Iason" of the Young School as the natural development of the prosody of Baudelaire, Mallarmé and Verlaine. Le Pèlerin passionné was sympathetically reviewed by Anatole France. As time went on he repudiated the label claimed by the symbolists, and became the leader of an offshoot from the main body known as the "école romantique," the chief members of which are Raymond de la Tailhède, Maurice du Plessis, Ernest Raynaud, and the critic Charles Maurras. Moréas and his new followers returned to the traditional severity of French versification, and to the classical and antique tradition. His set of Roman Poets, (Paris, 1882), and Examples (6 vols., complete ed. 1903), Histoire de Jean de Paris, roi de France (1902), Voyage en Grèce en 1897 (1902), Contes de la vieille France (1883), and a classic drama in verse, Iphigénie à Aulis (1904), in close imitation of Euripides, which was re-presented on the 24th of August 1903 in the ancient theatre of Orange, and subsequently at the Odéon in Paris. He died on the 31st of March 1910. See Anatole France, La Vie littéraire (4th ser., 1892); A. van Bever and F. Leautaud, Poètes d’aujourd’hui, 1850–1900 (11th ed., 1916); F. Bouilhet, "Sébastien Molard," and J. de Gourmont, Jean Moréas, biographie critique (1905). Moréas, Gustave (1826–1898), French painter, was born in Paris on the 6th of April 1826. His father was an architect, who, discerning the lad’s promise, sent him to study under Picot, a second-rate artist but clever teacher. The only influence which really affected Moreau’s development was that of the painter Chassériau (1819–1857), with whom he was intimate when they both lived in the Rue Frochot, and of whom we find reminiscences even in his later works. Moreau’s first picture, "Le Pélican" (1852), now in the cathedral of Angoulême. In the Salon of 1853 he showed a "Scene of the Barque of Psyche" (1863); and another (now in the Dijon Museum) and the "Death of Darius" (in the Moreau Gallery, Paris), both conspicuously under the influence of Chassériau. To the Great Exhibition of 1851 he sent the "Athenians with the Minotaur" (in the Museum at Bourg-en-Bresse) and "Moses putting off his Sandals within Sight of the Promised Land." "Oedipus and the Sphinx," began in 1862, and exhibited at the Salon of 1864, marked the beginning of his best period, during which he chose subjects from history, religion, legend and fancy. In 1865 he exhibited "Prometheus" in the "Sévres" (now at the Luxembourg) and "Médée" in 1866, "The Head of Orpheus" (in the Luxembourg Gallery); "Hesiod and the Muse," a painting; "The Peri," a painting; "Prometheus" (in the Moreau Gallery); "Jupiter and Europa," a "Pélican," and "The Saint and the Poet," in 1869. After working in obscurity for seven years, he reappeared at the Salon in 1876 with "Hercules and the Hydra," "Saint Sebastian," "Salome Dancing" (presented to the Luxembourg by M. Hayem); and in 1878 with "The Sphinx’s Riddle solved." Jacob, and "Moses on the Nile." Moreau exhibited for the last time at the Salon of 1888, when he contributed "Hetia" and "Galatea," to the Great Exhibition of 1888. He again sent the "Galatea" and "The Young Man and Death." He took prize medals at the Salon in 1864, 1865, 1869 and 1878. He was made knight of the Legion of Honour in 1875 and officer in 1883. He succeeded Delaunay as professor at the École des Beaux Arts, and his teaching was highly popular. When he died, on the 18th of April 1888, he bequeathed to the state his house, containing about 8000 pictures, water-colours, cartoons and drawings, which form the Moreau Gallery, one of the best organized collections in Paris, arranged by M. Rupp, his executor, and, together with Delaunay and Fromentin, one of his closest friends. See Ary Renan, Moreau (Paris, 1900): Paul Plat, Le Musée Gustave Moreau (Paris, 1900). Moréas, Hélie (1810–1858), French lyric poet, was born in Paris on the 9th of April 1810. In his early youth his parents, who were poor, migrated to Provins, where the
mother went into service and the father took the post of usher in a public school. He went to Paris before 1830, and lived a Bohemian life. He was habitually houseless, and exposed himself to the dangers of a cholera hospital in the great epidemic of 1832 simply to obtain shelter and food. Then he revisited Provins and published a kind of satirical serial called Diogène. Some years of this life entirely ruined his health, and it was only just before his death that he succeeded in getting his collected poems published, selling the copyright for £4 sterling and 80 copies of the book. This volume, Mysolis, was received not unfavourably, but the author's death on the 20th of December 1838, in a refuge of the destitute, created an interest in him. In 1804 he left a girl to his widow, and he has a strong note of imitation, especially in his earlier songs, distinguished from those of his model, Béranger, chiefly by their elegiac note. Some of his poems, such as the elegy La Voulte (1837) and the charming romance La Fermière (1835), have great sweetness and show incontestable poetic power. Moreau wrote some charming prose stories: Le Gui de chêne, La Souris blanche, &c.

MOREAU, JEAN VICTOR MARIE (1765-1813), French general, was born at Morlaix in Brittany on the 14th of February 1765. As a boy he was an usher at the Lycée of Morlaix, and 4 years at the Collège of Nantes. He succeeded in getting him to enter the army, as he attempted to do, insisted on his studying law at the university of Rennes. Young Moreau showed no inclination for law, but revelled in the freedom of a student's life. Instead of taking his degree he continued to live with the students as their hero and leader, formed them into a sort of army, which he commanded as their provost, and when 1789 came he commanded the students in the daily affrays which took place at Rennes between the young noblesse and the populace. In 1790 he was elected a lieut.-colonel of the volunteers of Ille-et-Vilaine. With them he served under Dumouriez, and in 1793 the good order of his battalion, and his own martial character and republican principles secured his promotion as general of brigade. Carnot, who had an eye for the true qualities of a general, promoted him to be general of division early in 1794, and gave him command of the right wing of the army under Pichegru, in Flanders. The battle of Tourcoing established his military fame, and in 1795 he was given the command of the Army of the Rhine-and-Moselle, with which he crossed the Rhine and advanced into Germany. He was at this time he found out the traitorous corre-

sepondence between his own comrade and commander Pichegru and the émigré prince de Condé. He had already appeared as Pichegru's defender against imputations of disloyalty, and now he foolishly concealed his discovery, with the result that he has ever since been suspected of at least partial complicity. Too late to clear himself, he sent the correspondence to Paris and issued a proclamation to the army denouncing Pichegru as a traitor. He was dismissed, and it was only when in 1799 the absence of Bonaparte and the victorious advance of Suvorov made it necessary to have some troops and experienced general in the army to keep the troops employed. He commanded the Army of Italy, with little success, for a short time before being appointed to the Army of the Rhine, and remained with Joubert, his successor in Italy, till Novi had been fought and lost. Joubert fell in the battle, and Moreau then conducted the retreat of the army to Genoa, where he handed over the command to Championnet. When Bonaparte returned from Egypt he found Moreau at Paris, greatly dissatisfied with the Directory both as a general and as a republican, and obtained his assistance in the coup d'état of 18 Brumaire, when Moreau commanded the force which confined two of the directors in the Luxembourg. In March, the First Consul again gave him command of the Army of the Rhine, with which he crossed the Rhine from the Rhine to the Isar. On his return to Paris he married Mlle Hullet, a Creole of Josephine's circle, an ambitious woman who gained a complete ascendency over him, and after spending a few glorious weeks with the army in Germany and winning the celebrated victory of Hohenlinden (Dec. 3, 1800) he settled down to enjoy the fortune he had acquired during his campaigns. His wife collected around her all who were discontented with the agrandissement of Napoleon. This "club Moreau" worked for the deposed the Royalists, but Moreau, though not unwilling to become a milice, fearing that the republic, would be no party to an intrigue for the restoration of Louis XVIII. All this was well known to Napoleon, who seized the conspirators. Moreau's condemnation was procured only by great pressure being brought to bear by Bonaparte on the judges; and after it was pronounced the First Consul treated him with a pretext of leniency, commuting a sentence of imprisonment to one of banishment. Moreau passed through Spain and embarked for America, where he lived in quiet and obscurity till his death at New Orleans in 1813. The destruction of the grande armée in Russia. Then, probably at the instigation of his wife, he committed the last and least excusable of the series of well-meant political errors that marked his career. Negotiations were set on foot with an old friend in the circle of republican intrigurers, Bernadotte, who, being now crown prince of Sweden and at the head of an army opposing Napoleon, introduced Moreau to the tsar Alexander. In the hope of returning to France to re-establish the régime of popular government, Moreau gave advice to the allied sovereigns as to the conduct of the war, but fortunately for his fame as a patriot he did not live to invade France. He was mortally wounded while talking to the tsar at the battle of Dresden on the 27th of August 1813, and died on the 2nd of September. He was buried at St Petersburg. His wife received a pension from the tsar, and was given the rank of maréchale by Louis XVIII., but his countrymen spoke of his "déflection" and compared him to Dumouriez and Pichegru.

Moreau's fame as a general stands very high, though he was far from possessing Napoleon's transcendent gifts. His com-

bining talents were skilfully elaborated, and his temper always unfruiled when most closely pressed. Moreau was a sincere republican, though his own father was guillotined in the Terror. He was fortunate in the moment of his death, though he would have been more so had he died in America. He seems by his final words, "Soyez tranquilles, messieurs; c'est mon sort," not to have regretted being removed from his equivocal position as a general in arms against his country.

The literature on Moreau is copious, the best book being C. Jochmus, General Moreau—Abriss einer Geschichte seines Lebens und seiner Feldzüge (Berlin, 1814). A more ordinary work is A. de Beauchamp, Vie politique, militaire, et privée du Général Moreau, traduit par Phillipert (London, 1814); and there is a curious tract on his death in Russian, translated into English under the title, Some Details Concerning General Moreau and his Last Moments, by Paul Svinin (London, 1814).

MOREAU DE SAINT MÉRY, MÉDÉRIC LOUIS ÉLIS (1750-1819), French politician, was born at Fort de France, in the island of Martinique, on the 28th of January 1750. He came to Paris at the age of nineteen, and became an avocat at the parlement of Paris. He subsequently returned to Martinique to practise law, and in 1780 was appointed member of the colonial council of San Domingo. Returning to Paris in 1784, he received a commission to study the legislation of the French colonies, and published Lois et constitutions des colonies françaises de l'Amérique sous le Vent de 1550 à 1785. In 1786 he was president of the assembly of the electors of Paris, played an active part in the early days of the Revolution, and was designated by Martigné to Martinique deputy to the Constituent Assembly. His moderate ideas were the occasion of his arrest after the 10th of August 1792, but he contrived to escape to the United States, opened

A fine promenade extends along the shore; there are a quay and a pier, a winter garden, and all the appointments of a seaside resort. The Midland railway is the harbour authority. The town was incorporated in 1902, and the corporation consists of a mayor, 6 aldermen and 16 councillors. The former alternative name was Poulton-le-Sands. Area, 1801 acres.

MOREL, the surname of several French classical scholars and printers in the 16th and 17th centuries, known for their editions of classical authors and the Fathers. (1) GUILLAUME MOREL (1505-1564) was born at Tilleul in Normandy. After acting as proof-reader in a Paris firm, he set up for himself, and subsequently succeeded Turnebus as king's printer in 1555. His most important work was *Thesaurus vocum omnium latinorum*, containing a number of quotations from Greek authors, taken from hitherto unpublished MSS, in the Paris library. (2) FÉDÉRIC (as he always called himself, not Frédéric) MOREL, surnamed the Elder (1525-1589), was born in Champagne. His father was a printer, and was not the contemporaneous Guillaume Morel. About 1550 he married the daughter of the famous printer, Michel de Vascosan, in 1557 set up in business in the rue Saint Jean de Beauvais, and in 1571 was appointed printer to the king. His chief publications were the *Declarations de Quintilian and L'Architecture de Philibert Deleorne*. (3) FÉDÉRIC MOREL, son of the preceding, surnamed the Younger (1555-1630), was one of the greatest Greek scholars of his time. In addition to the management of his father's business, to which he succeeded, he held the professorship of eloquence at the Collège de France. The number of his translations and commen-
taries on the Fathers and classical authors (Aristotle, Dio Chrysostom, Strabo) was very large; special mention may be made of his revised edition of Amyot's translation of *Plutarch* and his Latin translations of some of the dissertations of Maximus of Tyre, of Libanius, Hierocles and Theodoret. His commentaries on the Psalms is still considered valuable. (4) CLAUDE MOREL (1574-1676), brother of the preceding, also published editions of many of the Fathers and other authors, with learned prefaces and notes. (5) CHARLES MOREL (1602-1640) was printer and secretary to the king. He followed the example of the other members of his family, and issued the works of Clement of Alexandria, Gregory of Nazianzus, Cyril, Syntaxis and Chrysostom, and the Concilia generalia et provincialia of the German theologian Severin Bini. (6) GILLES MOREL, brother of the preceding (the dates of his birth and death are unknown), was the last representative of this learned family. The number of his publications was small, but some of them were of great importance, the chief being the *Grande bibliothèque des philologes*, in 17 folio vols. (1645).

See M. Mairain, *Historia typographiae aequo parisiensium* (1717), for all the above; Fédéric Morel the elder is the subject of a monograph by J. Dumoulin (Paris, 1901).

MORELIA (formerly Valladolid), a city of Mexico and capital of the state of Michoacán, 125 m. direct and 234 m. by rail W. by N. of the city of Mexico, near the southern margin of the great Mexican plateau, 6398 ft. above sea-level, in lat. 19° 42′ N. long., 106° 54′ W. Pop. (1900), 37,278, partly Indians and mestizos. Morelia is served by a branch of the Mexican National railway; its station is outside the city, with which it is connected by a small tramway line. The city is built on a rocky hill rising from the Guayangareo valley, which gives to it a strikingly picturesque appearance. It has the usual rectangular plan, with several pretty squares and straight, clean, well-paved streets. Facing the plaza mayor, now called the Plaza de los Martíres because of the execution there of the patriot Matamoros in 1814, is the cathedral, one of the finest specimens of the old Spanish renaissance church architecture in Mexico. Among its interior adornments is an ostry font, some fine wood carving in the choir, and the silver doors to the shrines of its chapels. Opposite the cathedral is the government palace, which also contains the public library. The municipal government is housed in an ancient tobacco factory converted to public uses, and a fine old Capuchin convent now serves as a public hospital. The Paseo, or public park, is distinguished for its fine trees and flowers. The Morelianos are noted for their love of music, and musical competitions are held each year, the best band being sent to the city of Mexico to compete with similar organizations from other states. The public water-supply is brought into the city over a fine old aqueduct (3 m. in length, carried on arches), which was built in 1785 by the bishop of the diocese as a famine relief work. In common with the other Mexican colonial cities, it is a strong center of liberal and conservatism. A large number of private schools are maintained through Church influence in opposition to the public schools. Conspicuous among these is a large girls' school. Another institution is the college of San Nicolás de Hidalgo, which was founded at Patzcuaro in 1540 by Bishop Quiroga (who had been sent into Michoacán to redress the wrongs committed by Nuño de Guzman), was removed to Valladolid (Morelia) a few years later to be combined with a local college, and was rebuilt in 1882. It is the oldest existing existing among the Mexican educational institutions. It was founded in 1828, in honour of the revolutionary leader José María Morelos y Pavón, and in 1865 it was made the see of an archbishop.

Morelia, first known as Valladolid, was founded in 1541 by Viceroy Mendoza. In 1582 Valladolid replaced Pátzcuaro as the capital of Michoacán. It was the birthplace of both Morelos and Iturbide, and was captured by Hidalgo at the beginning of the revolutionary outbreak of 1810-11, and by Iturbide in 1821 when on his march to Mexico City, where he was the emperor for a short time; in 1816 Hidalgo returned, and Morelos was a student. The city's manufactures include cotton, woolen and silk textiles, cigars and cigarettes, and *dulces*, or sweetmeats, Morelia being noted throughout Mexico for the latter, particularly for a variety called *Guabate*. Morelia, son of the preceding, was born on the 8th of June at Little Baddow, Essex, where his father was minister of the Congregational church (1799-1852). He proceeded to Homerton College in 1833, where he studied theology under Dr Pye Smith. He then entered Glasgow University, where he took his M.A. degree in 1841. Subsequently he studied philosophy and theology under Fichte at Bonn, and returned to England to undertake the pastorate of the Congregational church at Gosport. After three years' work, he decided to give up the ministry in favour of philosophical work. As early as 1846 he made his name by his *Historical and Critical View of the Speculative Philosophy of Europe in the Nineteenth Century*, which brought him to the notice of Lord Lansdowne, who made him an inspector of schools. From 1848 till 1876 he was active in this capacity. As a result of his experience he published numerous educational works, e.g. *The Analysis of Sentences* (1852), *The Essentials of English Grammar and Analysis* (1853), *Handbook of Logic* (1856), *Grammar of the English Language* (1857). He also published four lectures on *The Philosophical Tendencies of the Age* (1848), *The Philosophy of Religion* (1849), *Fichte's Contributions to Moral Philosophy* (1860), *Philosophical Fragments* (1878), *An Introduction to Mental Philosophy on the Inductive Method* (1884). He died on the 1st of April 1891.
MOREL-LADEUIL, LÉONARD (1829-1888). French goldsmith and sculptor, was born at Clermont-Ferrand. He was apprenticed first to Morel, a manufacturer of bronzes, under whom he became one of the most expert chasers, or ciseleurs, in France, and then to Antoine Vechte, to acquire the art of repoussé (q.v.)—the art in which he was to excel. He studied further under J. J. Feuchère and then attracted the notice of the comte d'Orsay and the duc de Morny, through whose recommendation the French government, desirous of popularizing the idea of the new Imperialism, commissioned him to produce the "Empire Shield." Napoleon III. notified his warm approval, but the trade, another than what a pupil should obtain commissions direct, resented the innovation and thenceforward boycotted the young artist, whose beautiful and poetic vase, "Dance of the Willis" (the spirits dancing round the vase, above the lake represented on a dish below) none would take. He was encouraged nevertheless by a foreign dealer in Paris, Marchi, who employed him on statuettes, mainly religious in character, until 1859, when Messrs Elkington, in view of the great exhibition of 1862, engaged him to work in Birmingham for three years in repoussé, assuring him a free hand. Following his silver "Night," came "Day," and then the "Inventions" vase, which placed him at once at the top of his profession. This was followed by the beautiful plateau called "Dreams," which was subscribed for (£1500) by Birmingham as the town wedding-gift to the prince and princess of Wales. Morel-Ladeuil's contract was then renewed for five years, but as a matter of fact he remained with the firm for twenty-three years at their London house, the first result being his masterpiece the "Milton Shield: Paradise Lost" (in repoussé steel and silver), which was the sensation of the Paris Exhibition. It was bought by the English government for £5000, and thousands of copies made by "galvanoplastie" or electrolyte were sold and spread all over the world. Then after "The Months" came another masterpiece, the "Helicon Vase," in steel, silver, and gold, priced at £6000, which in course of time was presented by the ladies and gentlemen of the royal house to Queen Victoria on her first jubilee. For the Philadelphia Exhibition (1876) Morel-Ladeuil produced "A Pompeian Lady at her Toilet," following it in 1878 with the "Bunyan Shield," a companion to the Milton. After putting forth his reliefs "The Merry Wives of Windsor," "The Merchant of Venice," and "Much Ado about Nothing," in view of his failing health he retired to Boulogne, where he died of angina pectoris on the 15th of March 1888, and was buried with much ceremony at Clermont-Ferrand. His total work, apart from the productions of his youth, numbers 35 pieces, which richly reveal his elegant and refined fancy and grace, his feeling for correct and dainty ornament, and his love of pure art marked by an elevated if rather sentimental taste and a noble style.

MORELLET, ANDRÉ (1727-1819). French economist and miscellaneous writer, was born at Lyons on the 7th of March 1727. He was one of the last survivors of the philosophes, and in this character he figures in many memoirs, such as Mme de Rémusat's. He was educated by the Jesuits in his native town, and at the Sorbonne; he then took holy orders, but his designation of abbé was the chief thing clerical about him. He had a ready and biting wit, and Voltaire called him l"Abbe Morellet was his chief stereotype, and the most notable parts of it were a smart pamphlet in answer to Charles Palissot's scurrilous play Les Philosophes (which procured him a short sojourn in the Bastille for an alleged libel on Palissot's patroness, the princess de Robec), and a reply to Galiani's Commerce des bîls (1770). Later, he made himself useful in quasi-diplomatic communications with English statesmen, and was pensioned, being, moreover, elected a member of the Academy in 1785. A year before his death in Paris on the 12th of January 1819 he brought out four volumes of Mélanges de littérature et de philosophie du XVIIIe siècle, composed chiefly of selections from his former publications, and after his death appeared his various Mémoires sur la XVIIIe siècle et la Révolution (2 vols., 1837).

A bibliography of his numerous works is given in Quérard's La France littéraire, vol. vi.; see also Sainte-Beuve, Causeries du lundi, vol. i.

MORELLI, GIOVANNI (1816-1891). Italian patriot and art critic, was born at Verona on the 16th of February 1816. He was educated first at Bergamo, the home of his mother, who had removed thither on the death of her husband; and then at Aarau in Switzerland. At the age of eighteen he commenced his university career at Munich, being debarred as a Protestant from entering any Italian college, and became the pupil of Ignazius Dillinger, the celebrated professor of anatomy and physiology. Natural philosophy and medicine were the studies to which he specially devoted himself, but he was also keenly interested in all scientific and literary pursuits. At Munich, and later at Erlangen, Berlin and Paris, his brilliant gifts and independence of thought and judgment attracted the attention of the most distinguished men of the day. In Paris he became intimate with Otto Münch, and his intercourse with that eminent critic was not without its effect in determining the direction of his future studies; and, during a longer stay spent in Switzerland, he formed a friendship with Louis Agassiz, whose teaching made a deep and lasting impression upon him. On his return to Italy in 1840 he became associated in Florence with that band of patriots who were strenuously labouring for the deliverance of their country from the oppressive Austrian rule. He took an active part in the war of 1848, and was subsequently chosen by the provisional Lombard government to plead the cause of Italian unity before the German parlia-

ment assembled at Frankfort. In 1860, in recognition of the great services rendered to his country by Morelli, Victor Emmanuel named him a citizen of the Sardinian kingdom, and in the following year he was elected deputy for Bergamo to the first free Italian parliament. He was a staunch supporter of Cavour, and, though never a leading politician, exercised a considerable influence over the most prominent statesmen of the Right, who valued his sound judgment, integrity, moderation and foresight. One of his first acts after his election was to draw the attention of parliament to the urgent need of reform in the administration of matters relating to the fine arts. In consequence of his representations, a commission was appointed with the object of bringing under government control all works of art which could be considered public property. The commission, of which Morelli was named president, began its work in Umbria and the Marches, and he appointed as his secretary G. B. Cavalcaselle, who was then engaged in collecting materials for a work on Italian art. According to one who knew Morelli well, much that Cavalcaselle then learned from his chief was embodied in the well-known History of Painting, which was published in 1864 in conjunction with Sir Joseph Crowe.

The immediate result of Morelli's first labours in the Marches was the passing of the law, which bears his name, strictly prohibiting the sale of works of art from public and religious institutions. In 1875 he was named a senator of the kingdom of Italy, having voluntarily resigned his seat in the Lower House owing to the increasingly democratic tendencies of the Chamber. In Rome, the seat of the government since 1870, he spent several months of each year; but his settled home was Milan, whither he had removed from Bergamo in 1874. Here he published some of his researches into the history of Italian art. In order to be free to speak his mind unreservedly, he determined to adopt a pseudonym and to write in German. His first contributions, a series of articles on the Borghese Gallery, were published in Lützow's Zeitschrift für bildende Kunst between the years 1874 and 1876. Posing as an art-loving Russian, who puts forth his opinions with the utmost difidence, he adopted the pseudonym of Ivan Lermolle—an anagram of his own name with a Russian termination—and described his essays as Ebn kritischer Versuch, translated from the Russian by Johannes Schwarze, this time a Germanized form of Morelli.
MORELOS

The originality of the method recommended by the author for studying art, the general soundness of his critical opinions, and the many new (and apparently correct) attributions suggested for pictures in the Borghese Gallery and elsewhere, attracted the attention of all students of art, and he was soon regarded by students of the individual pictures and forms as, in his estimation, of the highest importance, for they were not mere incidents, but the outward and visible seal of an artist's character stamped upon his work, and obvious to all who had eyes to see. By diligent observation of the forms the rudiments of the language of art might be mastered, and the first step taken towards initiating a methodized system of study. The education of a critic consists chiefly in learning to compare, and Morelli soon recognized the value of systematic comparison in the study of art. By the combined methods of critical analysis and comparative observation, he found the clue he had so long been seeking. Studying one day in the Ufizzi, it suddenly struck him that in a picture by Botticelli containing several figures the drawing of the hands was remarkably similar in all; that the same characteristic but plebeian type, with bony fingers, broad square nails, and dark outlines, was repeated in every figure. Turning to the ears, he observed that they also were drawn in an individual manner, and that in the numerous figures in which the ear was visible the same typical form occurred. Having noted these fundamental forms, he proceeded to an examination of the master's life-like portraits, and found that the same forms were exactly repeated, together with other individual traits which seemed distinctive of the master: the characteristic type of head and expression, the drawing of the nostrils, the vitality of movement, the disposition of drapery, harmony of colour (where it had not been tampered with by the restorer), and quality of landscape. In all Botticelli's true works the presence of these and other characteristics proclaimed their genuineness.

In paintings where the forms and types were those of the painter, but where vitality, movement, and all deeper qualities were absent, Morelli recognized works executed from the master's life-like portraits, whether original or copies. He concluded that these were responses to the test, and where only a general family likeness connected them with Botticelli, he discerned the productions of pupils and imitators. After applying his method to the works of Botticelli, he proceeded to examine those of other Florentine masters, and afterwards of painters of other Italian schools, everywhere meeting with results to him not less convincing. If the drawing of the hand and ear were not always conspicuous, there were other peculiarities of this language of form to aid in the identification of a master: the treatment of the hair, and especially the spurs; the expression of the eyes; the method of the eyelid and upper lip; the form of the feet; the nose, and the like. In short, all apparently insignificant details were of importance in his plan of study, for to him they were like the signature of the master. (C. J. F. *)

MORELOS, an inland state of Mexico on the southern slope of the great Mexican plateau, lying S. of the Federal District, with the states of Puebla on the E. and S.E., Guerrero on the S., and Mexico on the W., N. and N.E. Pop. (1900), 161,697, including a large percentage of Indians and mixed bloods. Area, 2,773 sq. m., from 2,000 ft. to 11,000 ft. in elevation and ranges extending southward from the Sierra de Ajusco, forming numerous valleys opening southward. It is drained by the Aracuas river, a northern tributary of the Mescalas, or Balsas. There is a wide variation of climate for so small a territory, the higher elevations of the Sierra de Ajusco being cold and humid (the Mexican Central crosses the range at an elevation of 9,974 ft.); the lower spurs mild, temperate and healthy, the lower valleys subtropical, hot and unhealthy. The rainfall is least in the lower regions and irrigation is generally employed. Notwithstanding its mountainous character, Morelos is one of the most flourishing agricultural states of Mexico, producing sugar, rice, Indian corn, coffee, wheat, fruit and vegetables. Although the state is supposed to have several of the minerals found in this part of Mexico (silver, cinnamon, iron, lead, gold, petroleum and coal), its mining industries continue undeveloped.
and neglected. San Antonio, a suburb of Cuernavaca, is noted for its pottery, which is highly attractive in form and colour, and finds a ready market among the visitors to that city. Morelos is traversed by two railway lines—the Interoceánica from N.E. to S.W., and the Mexican Central almost N. and S., the latter affording direct communication between the national and state capitals.

The capital of the Cuernavaca (pop. 9584 in 1900), 47 m. S. of the city of Mexico on the Mexican Central railway, is one of the most picturesque towns in Mexico. It dates from the time of Cortés, who built for himself a residence there, and had the town included in the royal grant to himself in 1529. Maximilian had a villa there, and many of the public men of Mexico, natives of the lowlands, have made their homes there rather than in the national capital. The palace of Cortés is now occupied by the state legislature and by various public offices, and Maximilian’s villa by a school.

After the capital the largest city in the state is Cuautla Morelos, or Ciudad Morelos (pop. 6269 in 1900), 27 m. east by south of Cuernavaca, on the Interoceánica railway, and in a rich sugar-producing district. Some of the largest and most modern sugar-mills of Mexico are in the Cuautla district. There are hot sulphur springs here.

The town is celebrated in Mexican history for the intrepid defence of the place by José María Morelos (1765-1815), the patriot leader, against a greatly superior royalist force, from the 19th of February to the 2nd of May 1812, when he cut his way through the attacking army and escaped. Other important towns are Yatepec (1900), 16 m. east of Cuernavaca, on the Interoceánica line; Tecomela, 13 m. south-west of the capital, a characteristic Indian town near the pyramid of Xochicalco, and Jojutla, 21 m. south of the capital, on the Interoceánica railway near the southern boundary of the state. An interesting local phenomenon is that of Lake Tequesquitlan, which was formed by the subsidence of a large area of ground about the middle of the 17th century, carrying with it an old town of the same name. The hollow filled with water, and the spire of the old church is still to be seen in the middle of the lake.

Moresnet, a small neutral state lying on the borders of Prussia and Belgium, 4 m. S.W. of Aix-la-Chapelle, and embracing an area of nearly 1,400 acres. Its only village is that of Neutral Moresnet, also called Kelmis or Kalmis, with 2800 inhabitants. Just over the Prussian frontier is Prussian Moresnet, with 650 inhabitants, and in Belgium is Belgian Moresnet, with about 1200. Moresnet, strictly Montzen-Moresnet, is, as its name implies, a mountain, under which is the extremely valuable zinc mine owned by the Vieille Montagne Company, which is a Belgian undertaking. The production of zinc is divided between the two states, but a tendency has been observed to convert it gradually into a German possession. The state of Moresnet owes its origin to the general European settlement of 1815. No agreement could be reached about the ownership of this small district, and it was made a neutral state under the joint government of Prussia and Belgium. This arrangement lasted until 1841, when Moresnet was given an administration of its own, this being composed of a burgomaster and a council of ten members. The inhabitants decide individually whether they will perform military service for Prussia or for Belgium, and also whether they will accept the jurisdiction of the Prussian or of the Belgian courts.

See Hoch, Un Territoire oublié au centre de l’Europe (Bern, 1881); Schröder, Das grenzstreitige Gebiet von Moresnet (Aix-la-Chapelle, 1902); and Spandau, Zur Geschichte von Neutral-Moresnet (Aix-la-Chapelle, 1903).

Moreton Bay Chestnut, a tall tree known botanically as Castanospermum australe (natural order Leguminoseae), native of Queensland and New South Wales. The pods are almost cylindrical, about 9 in. long and 2 in. broad, and are divided into three to five cells, each of which contains a large chestnut-like seed. The seeds are roasted and eaten by the natives; the timber, which somewhat resembles walnut, is soft, fine-grained, and takes a good polish, but is not durable.

Moreto y Cavana, Agustin (1618-1661), Spanish dramatist and playwright, was baptized at Madrid on the 9th of April 1618. He graduated at Alcalá in December 1639, and resided in Madrid till 1654, when he removed to Toledo, took orders, and became chaplain to the priorate of El altar de San Miguel. He died at Toledo on the 1st of October 1669, while engaged on Santa Rosa, a play which was completed by Pedro Francisco Lanini. The first volume of his dramas was published in 1654; the second and third volumes appeared in 1676. The most celebrated of his pieces is El Desden con el Desdén, imitated by Molière in La Princesse d’Élide, by Gozzi in La Principessa filosofa, and by Schryvogel in Donna Diana. It is characteristic that four episodes in El Desden con el Desdén are taken from four separate plays of Lope de Vega’s (La Vengadora de las mujeres, Las Milagros del desprecio, De Corte à censorio, and La Hermosa fco.). Moreto borrows from Castro, Tisro de Molina and others to an extent which is indicated at length in Fitzmaurice-Kelley’s Littérature espagnole (Paris, 1894), but his adaptation shows great dexterity and charm.

Moreto, IL ("The Blackamoor," a term which has not been particularly accounted for), the name currently bestowed upon Alessandro Bonvicino (1498-1554), a celebrated painter of Brescia, Venetian school. He was born at Rovato, in the Brescian territory, in 1498, and studied, first under Fioravante Ferramola of Brescia, afterwards, still youthful, with Titian in Venice. His own style, to which he added the most exploit in portrait-painting, was naturally modelled on that of Titian. Afterwards he conceived a great enthusiasm for Raphael (though he does not appear to have ever gone to Rome), and his style became partially Raphaelesque. It was, however, novel in its combination of diverse elements, and highly attractive—with fine pencilling, a rich yet not lavish use of perspective and decorative effects, and an elegant opposition of light and shade. The human figure is somewhat slender in Bonvicino’s paintings, the expression earnestly religious, the flesh-tints varied, more so than was common in the Venetian school. The backgrounds are generally luminous, and the draperies well modified in red and yellow tints with little intermixture of blue. The depth of Bonvicino’s talent, however, was hardly in proportion to its vigour and vivacity; and he excelled more in sedate altarpieces than in subjects of action, and more in oil-painting than in fresco, although some fine series of his frescoes remain, especially that in the villa Martignano at Novarino, near Brescia. Among his celebrated works in the city are—in the church of S. Clemente, the "Virgin Madlys," and the "Assumption of the Madonna," (this latter being considered his masterpiece); in S. Nazaro e Celso, the "Coronation of the Madonna," in S. Maria della Grazie, "St Joseph," in S. Maria de’ Miracoli, "St Nicholas of Bari." In the Vienna Gallery is a "St Justina" (once ascribed to Pordenone); in the Städel Institute, Frankfort, the "Madonna enthroned between Sts Anthony and Sebastian;" in the Berlin Museum, a colossal "Adoration of the Shepherds," and a large votive picture (one of the master’s best) of the "Madonna and Child," with infant angels and other figures above the clouds, and below, amid a rich landscape, two priests; in the National Gallery, London, two scenes between Christ and other saints and two impressive portraits. II Moreto is stated to have been a man of child-like personal piety, preparing himself by prayer and fasting for any great act of sacred art, such as the painting of the Virgin-mother. His dated works extend from 1534 to 1554, and he was the master of the pre-eminent portrait-painter Moroni. He died on the 22d of December 1554.

Morgagni, Giovanni Battista (1682-1771), Italian anatomist, was born on the 25th of February 1682 at Forlì. His parents were in comfortable circumstances, but not of the nobility; it appears from his letters to G. M. Lancisi that Morgagni was ambitious of gaining admission into that rank, and it may have been this ambition that led him to abandon the study of law for that of medicine. He was graduated at Forlì in 1785, and the town library preserves fourteen manuscript volumes of his writings.
be inferred that he succeeded from the fact that he is described on a memorial tablet at Padua as "nobilis fortenarius." At the age of seventeen he went to Bologna to study philosophy and medicine, and he graduated with much <i>telat</i> as doctor in both faculties three years later (1701). He acted as prosector to A. M. Valsalva (one of the distinguished pupils of Malpighi), who held the office of "demonstrator anatomicus" in the Bologna school, and whom he assisted more particularly in preparing his celebrated work on the <i>Anatomy and Diseases of the Ear</i>, published in 1704. Many years after (1730) Morgagni edited a collected edition of Valsalva's writings, with important additions to the treatise on the ear, and with a memoir of the author. When Valsalva was transferred to Parma Morgagni succeeded to his anatomical demonstratorship. At this period he enjoyed a high repute in Bologna; he was made president of the Academy Inquiritorum when in his twenty-fourth year, and he is said to have signalized his tenure of the presidential chair by discouraging abstract speculations, and by setting the fashion towards exact anatomical observation and reasoning.

He published the substance of his communications to the Academy in 1706 under the title of <i>Adversaria anatomica</i>, the first of a series by which he became known throughout Europe as an accurate anatomist; the book included "Observations on the Larynx, the Lachrymal Apparatus, and the Pelvic Organs in the Female." After a time he gave up his post at Bologna, and occupied himself for the next two or three years at Padua, where he had a friend in Domenico Guglielmini (1655-1710), professor of medicine, but better known as a writer on physics and mathematics, whose works he afterwards edited (1719) with a biography. Guglielmini desired to see him settled as a teacher at Padua, and the unexpected death of Guglielmini himself made the project feasible, Antonio Vallisneri (1661-1730) being transferred to the vacant chair, and Morgagni succeeding to the chair of theoretical medicine. He came to Padua in the spring of 1712, being then in his thirty-first year, and he taught medicine there with the most brilliant success until his death on the 6th of December 1771.

When he had been three years in Padua an opportunity occurred for his promotion (by the Venetian senate) to the chair of anatomy, in which he became the successor of an illustrious line of scholars, including A. Vesalius, G. Fallopius, H. Fabricius, Gasserius, and A. Spigelius, and in which he enjoyed a stipend that was increased from time to time by vote of the senate until it reached twelve hundred gold ducats. Shortly after coming to Padua he married a lady of Forlì, of noble parentage, who bore him three sons and twelve daughters. Morgagni enjoyed an unequalled popularity among all classes. He was of tall and dignified figure, with blonde hair and blue eyes, and with a frank and happy expression; his manners were polished, and he was noted for the elegance of his Latin style. He lived in harmony with his colleagues, who are said not even to have envied him his unprecedentedly large stipend; his house and lecture-theatre were frequented "tangue officina sapientiae" by students of all ages, attracted from all parts of Europe; he enjoyed the friendship and favour of distinguished Venetian senators and of cardinals; and successive popes conferred honours upon him. Before he had been long in Padua the students of the German nation, of all the faculties there, elected him their patron, and he advised and assisted them in the purchase of a house to be a German library and club for all time. He was elected into the imperial Caesareo-Leopoldina Academy in 1708 (originally located at Schweinfurth), and to a higher grade in 1732, into the Royal Society in 1724, into the Paris Academy of Sciences in 1731, the St. Petersburg Academy in 1735, and the Berlin Academy in 1754. Among his more celebrated pupils were Antonio Scarpa (who died in 1832, connecting the school of Morgagni with the modern era), Domenico Cotugno (1736-1822), and L. M. A. Caldani (1725-1813), the author of the magnificent atlas of anatomical plates published in 2 vols. at Venice in 1801-1814.

In his earlier years at Padua Morgagni brought out (1717-1719) five more series of the <i>Adversaria anatomica</i>, by which his reputation was first made; but for more than twenty years after the last of these his strictly medical publications were few and casual (on gall-stones, varices of the vena cava, cases of stone, and several membranes on medico-legal points, drawn up at the request of the curia). His real work appeared in the <i>Sedibus et causis morborum per anatem indagatis</i>, which during the succeeding ten years, notwithstanding its bulk, was reprinted several times (thrice in four years) in its original Latin, and was translated into French, English, and German (1711). Some account of this remarkable work remains now to be given.

Morgagni's special treatise on pathological anatomy previous to that of Morgagni was the work of Théophile Bonet of Neuchâtel, <i>Sepulchrum: seu anatomia practica ex cadaveribus morbo denatis, first published (Geneva, 2 vols, folio) in 1679, three years before Morgagni was born. It was reprinted, and a German edition appeared at Leyden in 1709. Although the normal anatomy of the body had been comprehensively, and in some parts exhaustively, written by Vesalius and Fallopius, it had not occurred to any one to examine and describe systematically the anatomy of diseased organs and parts. Harvey, a century after Vesalius, naively remarks that there is more to be learned from the dissection of one anatomy of diseased organs and parts should be written for than from the bodies of ten persons who had been hanged. F. Glisson, indeed (1597-1677), shows, in a passage quoted by Bonet in the preface to the <i>Sepulchrum</i>, that he was familiar with the idea, at least of comparing the anatomies of healthy and diseased parts in series of cadavers, and of noting those conditions which invariably accompanied a given set of symptoms. The work of Bonet was, however, the first attempt at a systematic study of the pathological anatomy of human beings; he enjoyed much repute in its day; Haller speaks of it as "an immortal work, which may in itself serve for a pathological library." Morgagni's work in the realm of medicine was unique in the world, and he merits the title of the "father of modern pathology." He had finished his edition of Valsalva in 1740, he was taking a holiday in the country, spending much of his time in the company of a young friend who was curious in many branches of knowledge. The conversation turned upon the <i>Sepulchrum</i> of Bonet, and it was suggested to Morgagni by his disettante friend that he should put on record his own observations. It was agreed that letters on the anatomy of diseased organs and parts should be written for the perusal of this favoured youth (whose name is not mentioned); and they were continued from time to time until they numbered seventy. These seventy letters constitute the <i>De sedibus et causis morborum per anatem indagatis</i>, published in 2 vols, folio (Venice, 1761), twenty years after the task of epitomizing them was begun. The letters are arranged in five books, each of which contains in the first part descriptions of the symptoms and causes of the maladies treated; in the second part, the diseases, classified into groups, are described with all the care and accuracy that could be expected; the third part is occupied with the causes of accidents which may occur in the various operations of surgery and therapeutics. The range of Morgagni's scholarship, as evidenced by his references to early and contemporary literature, is astonishing. It has been contended that he was himself not free from prolixity, that he never stopped sin of verbosity. The arrangement of his treatise is such as to make it difficult to use in the present day, notwithstanding that it is well indexed in the original edition, and that it has been ably edited in both French and German editions of the recent editions. It differs from modern treatises in so far as the symptoms determine the order and manner of presenting the anatomical facts. Although Morgagni was the first to understand and demonstrate the diagnostic importance of morbid pathology, he made no attempt (like that of the Vienna school sixty years later) to exalt pathological anatomy into a science disconnected from clinical medicine and the practice of medicine. He endeavored to establish an orderly and logical method of treating the subject in a way that could be understood by a general practitioner. His looseness of anatomical method (implying his skill
MORGAN, D.—MORGAN, SIR H.

with the seatbell), his precision, his exhaustiveness, and his freedom from bias, are his essentially modern or scientific traits; his scholarship and high consideration for classical and foreign work, his sense of practical ends (or his common sense), and the breadth of his intellectual horizon prove him to have lived before medical science was a secondarily technical or mechanical. His treatment was the commencement of the era of steady or cumulative progress in pathology and in practical medicine. Symptoms from that time onward have been placed in the hands of a genuine or conventional group, each of which was a disease; on the other hand, the began to be regarded as "the cry of the suffering organs," and it became possible to develop Thomas Sydenham's grand conception of a natural history of disease in a scientific sense.

A biography of Morgan by Mosca was published at Naples in 1768. His life may also be read in A. Fabroni's Vitae illust., Italor., and a convenient abridgment of Fabroni's memoir will be found printed in the fourth volume of the collected edition of his works was published at Venice in 5 vols. folio, in 1765.

MORGAN, DANIEL (1736–1802), American soldier, was born in Hunterdon county, New Jersey, in the winter of 1736, of Welsh ancestry. In 1753 he removed to Virginia. In June 1775, soon after the outbreak of the War of Independence, he was commissioned a captain of Virginia riflemen, and he marched his company to Boston in 21 days. In the winter of 1775 he accompanied General Benedict Arnold to Canada, and in the assault on Quebec (Dec. 31) he and his riflemen penetrated well into the city, where he was hemmed in and was forced to surrender. On the 7th of August 1776 he was discharged on parole; on the 12th of November he was commissioned colonel of the 11th Virginia; and soon afterwards he was released from his parole.

In September 1777 he was engaged in minor skirmishes in New Jersey, and early in September joined General Horatio Gates, then engaged in the campaign against General Burgoyne. At the first battle of Saratoga (Sept. 19) he was, until Arnold's arrival late in the day, the ranking officer on the field; and in the second battle (Oct. 7) also took a prominent part. Morgan rejoined Washington in November near Philadelphia. In March 1779 he was commissioned by Congress colonel of the 7th Virginia; and but in July, suffering from poor health and dissatisfied because Congress did not advance him further in rank, he resigned from the army and retired to Virginia. After the battle of Camden, however, he joined Gates (then in command in the South) at Hillsborough, North Carolina, and on the 1st of October took command of a corps. On the 13th of the same month Congress tardily raised him to the rank of brigadier-general. In January 1781 Cornwallis and Tarleton attempted to entrap him, but at the Cowpens (Jan. 17) he defeated Tarleton and then escaped from Cornwallis into North Carolina. Apparently Morgan suggested to Greene (who had superseded Gates) that general's plan of campaign on the 15th of March. In December 1793 he was commissioned major-general of Virginia militia, and in November 1794 commanded troops sent to suppress the Whisky Insurrection in western Pennsylvania. He was a Federalist representative in Congress in 1797–1799, and died in Winchester, Virginia, on the 6th of July 1802.

MORGAN, EDWIN DENNISON (1811–1883), American merchant and philanthropist, one of the "war governors" of New York state, was born in Washington, Berkshire county, Massachusetts, on the 8th of February 1811. He was first a clerk and then a partner in his uncle's store at Hartford, Connecticut, and became head of the New York firm of E. D. Morgan & Co. (formed in 1847). He engaged in politics, first as a Whig and then as a Republican. In 1849 he was elected president of the Board of Assistant Aldermen of New York City; he was a member of the Assembly and secondly of the Senate; in the passage of the bill providing for the establishment of Central Park in New York City; in 1855–1858 he was state commissioner of immigration; from 1859 to 1863 he was governor of New York, being the first Republican executive of the state; in 1863–1869 he was United States senator from New York. He died in New York City on the 14th of February 1883. Morgan was one of the founders of the Republican party, and was chairman of the National Republican Committee in 1856–1864 and in 1872. He was one of the most efficient and able of the war governors; even before the outbreak of the Civil War he did much to prepare the state government for it, and from September 1861 to July 1865 he was in command of the military department of New York, with the rank of major-general of volunteers. He was a liberal donor to Union Theological Seminary, Williams College and other institutions. His collection of paintings and sculpture, much of which had long been loaned to the Metropolitan Museum, was sold in January 1886.

MORGAN, SIR HENRY (c. 1635–1688), Welsh buccaneer, and lieutenant-governor of Jamaica, was the eldest son of Robert Morgan of Llanrhymney in Glamorganshire. He is said to have been kidnapped as a boy at Bristol and sold as a slave at Barbados, thence making his way to Jamaica, and is possibly to be identified with the Captain Morgan who accompanied the expedition of John Morris and Jackman when Vildemos, Trujillo and Granada were taken. In 1666 he commanded a ship in Edward Mansfield's expedition which seized the island of Providence or Santa Catalina, and when Mansfield was captured and killed by the Spaniards shortly afterwards Morgan was chosen by the buccaneers as their "admiral." In 1668 he was commissioned by Sir Thomas Modyford, the governor of Jamaica, to capture some Spanish prisoners, in order to discover details of the threatened attack on Jamaica; and collecting ten ships with 500 men south of Cuba, he landed and marched to Puerto Príncipe, which he took and pillaged; and afterwards accomplished the extraordinary feat of taking by storm the fortified and well-garrisoned town of Porto Bello on the mainland. The governor of Panama, astonished at this daring adventure, in vain attempted to drive out the invaders, and finally Morgan consented to evacuate the place on the payment of a large ransom. These exploits had considerably exceeded the terms of Morgan's commission, which had been accomplished by frightful cruelties and excesses; but the governor endeavored to cover the whole under the necessity of allowing the English a free hand to attack the Spaniards whenever possible. Morgan was almost immediately entrusted with another expedition by Modyford against the Spaniards, and proceeded to ravage the coast of Cuba. In January 1669 the largest of his ships was blown up accidentally in the course of a caravel on board, Morgan and his officers narrowly escaping destruction. In March he sacked Maracaibo, and afterwards Gibraltar. Returning to Maracaibo, he found three Spanish ships waiting to intercept him; but these he destroyed or captured, recovered a considerable portion of treasure from one which had sunk, exacted a heavy ransom as the price of his evacuating the place, and finally by an ingenious stratagem eluded the enemy's guns altogether and escaped in safety. On his return to Jamaica he was again reprieved, but not punished by Modyford. The Spaniards on their side were moreover acting in the same way, and a new commission was given to Morgan, as commander-in-chief of all the ships of war in Jamaica, to levy war on the Spaniards and destroy their ships and stores, the booty gained in the expedition being the only pay. Accordingly, after ravaging the coast of Cuba and the mainland, Morgan determined on an expedition to Panama. He recaptured the island of Santa Catalina on the 15th of December 1679, and on the 27th gained possession of the castle of Chagres, killing 300 of the garrison. Then with 1400 men he ascended the Chagres river, and after overcoming perils and obstacles of all kinds he appeared before Panama on the 18th of January 1671, defeated a much larger force than his own, and took the city. The fame of this brilliant exploit was however again obscured by abominable scenes of cruelty and debauchery, during which a galleon containing a considerable part of the booty escaped. Moreover, on returning to Chagres the members of the expedition found themselves cheated of their fair share of the spoil, while Morgan escaped with a

MORGAN, J. H.—MORGAN, L. H.

few ships to Jamaica, leaving the rest to get home as best they could. On his return he received the thanks of the governor and council; but meanwhile on the 8th of July, 1670, a treaty had been signed between Spain and England, and both Modyford and Morgan were ordered home under arrest to answer for their conduct. Morgan, however, soon succeeded in gaining the king's favour, and in the autumn of 1674 he was appointed lieutenant-general of Jamaica, commanding its naval and military forces, which he held for six years. After such a career as his it is not surprising that Morgan's conduct as a responsible official of the government was not very creditable. He was charged by Lord Vaughan, afterwards earl of Carbery, the governor, soon after his appointment, of persisting in encouraging privateering; he intrigued against his colleagues and successive governors of Jamaica, with the hope of superseding them; raised factious dissensions; and supported the outrageous conduct of his brother, Captain Charles Morgan, a terrible ruffian, and his kinsman, Colonel Dynollos, taking part in their brawl and drunken orgies. He was finally, on the 12th of October 1683, suspended in Jamaica from all his employments; a decision which was confirmed by the government at home after hearing Morgan's defence; but he was restored to his place in the council on the 18th of July 1688, shortly before his death, which took place in August.

See A. O. Exquemelin (one of Morgan's buccaneers), Buccaneers of America (1684, reprinted in 1891); A. Morgan, History of the Family of Morgan (1901).

MORGAN, JOHN HUNT (1825-1864), American Confederate soldier, was born in Huntsville, Alabama, on the 1st of June 1825, and was brought up on a farm near Lexington, Kentucky, to which his parents removed in 1830. In the Mexican War he was a first lieutenant of a Kentucky cavalry regiment. On the outbreak of the Civil War he was captain of the Lexington Rifles (organized in 1857); in September 1861 he succeeded in getting out of Lexington the company's arms after the issue of the order for the disarming of the state guard, and late in the same month reached the Confederate camp at Woodsonville on the Green river. He proved himself an able scout, and was made captain of a cavalry company and commander of a cavalry "squadron" including two other companies, which in February 1862, with General A. S. Johnston's other forces, withdrew from Kentucky to Corinth, Mississippi. He was commissioned a colonel after the battle of Shiloh, and in July 1862, starting from eastern Tennessee, made the first of his famous raids. He routed a Federal force at Lebanon, destroyed much rolling stock and other railway property, and threatened Louisville and Cincinnati. In August and September he took part in General Bragg's invasion of Kentucky, and again threatened Ohio. In December he defeated the Union garrison at Huntsville, Tennessee, taking prisoners, valuable stores, and many cattle; was commissioned brigadier-general for this success; and soon afterward again raided Kentucky. To cover Bragg's movement from Tullahoma to Chattanooga Morgan made, in July 1863, his famous raid into Indiana and Ohio. Bragg had instructed him to confine himself to Kentucky, but Morgan hoped to gain recruits in Indiana, where opposition to the war was strong. With 2400 men he crossed the Cumberland near Burkesville, Kentucky, on the 2nd of July; on the 5th captured a garrison at Lebanon; and on the 13th entered Ohio near Harrison. The regular cavalry, under Generals E. H. Heintzelman and M. C. Shafter, was now close behind him, and his way was beset by quickly gathering militia. He marched through the suburbs of Cincinnati on the night of the 13th and on the 18th got to Portland, near Bufington Island, where he attempted to cross on the next day; but gunboats and steamers prevented him. In a sharp battle he lost 600 or more men. As many more surrendered soon afterwards, and about 300 crossed the river. On the 26th he surrendered to General Shafter at New Lisbon. He was imprisoned with 70 of his men in the penitentiary at Columbus, from which on the night of the 27th of November he and six of his companions escaped by a tunnel they had dug. In the spring of 1864 he was put in virtual command of the Department of South-western Virginia, which included eastern Tennessee, and late in August he took command at Jonesboro, Georgia. On the 4th of September he was shot in a garden in Greenville, Tennessee, having been betrayed, it appears, to the Federals. Morgan had an excellent eye for topographical details, and by the swiftness of his movements and his sudden blows kept Kentucky in continual alarm. His lieutenant, Basil W. Duke, says that his force at no time reached 4000, but that it "killed and wounded nearly as many of the enemy and captured more than 15,000."

See Basil W. Duke, History of Morgan's Cavalry (Cincinnati, 1867).

MORGAN, JOHN PIERPONT (1837-1913), American financier and banker, was born in Hartford, Connecticut, on the 17th of April 1837, a son of Junius Spencer Morgan (1813-1890), who was a partner of George Peabody and the founder of the house of J. S. Morgan & Co. in London. He was educated at the English High School in Boston and at the University of Göttingen. In 1857-1860 he worked in the New York banking houses of Clinton, Woodson & Co., and Morgan, Grenfell & Co. From 1870 to 1871 he was agent and attorney in New York for George Peabody & Co. of London, and afterwards for its successor, J. S. Morgan & Co., of which he became head; in 1864-1871 was a member of the firm of Dabney, Morgan & Co.; and in 1871 he entered the firm of Drexel, Morgan & Co., in which he was associated with Anthony J. Drexel, of Philadelphia, upon whose death in 1893 he became senior partner. In 1895 the firm became J. P. Morgan & Co. Closely associated with Drexel & Co. of Philadelphia, Morgan, Harjes & Co. (successors to Drexel, Harjes & Co.) of Paris, and Drexel, Morgan & Co. of London, he became, largely owing to Mr Morgan's ability, one of the most powerful banking houses in the world. He carried through the formation of the United States Steel Corporation (which took over the business of Andrew Carnegie and others), harmonized the coal and railway interests of Pennsylvania, and purchased the Leyland line of steamships and other British lines in 1902, thus effecting an Atlantic shipping "combine" (see STEAMSHIP LINES); and it, or the banking houses which it succeeded, reorganized the following railways: Albany & Susquehanna (1869); the Chesapeake & Ohio, and the Cleveland, Cincinnati, Chicago & St Louis (1886); the Erie and the Reading (1893); the New York & New England (1896); the Northern Pacific (1897); the Baltimore & Ohio (1899), &c.; and in 1895 it supplied the United States government with $63,000,000 in gold to float a bond issue and restore the treasury surplus of $100,000,000. Mr Pierpont Morgan was a prominent member of the Protestant Episcopal Church; an enthusiastic yachtsman, whose "Columbia" defeated the "Shamrock" in 1899 and 1901 for the "America's" cup; a notable collector of books, pictures, and other art objects, many loaned or given to the Metropolitan Museum of Art (of which he was president), and many housed in his London house and in his private library on 36th Street, near Madison Avenue, New York City; and a generous benefactor of the American Museum of Natural History, the Metropolitan Museum of Art, Harvard University (especially its medical school), the Lying-in Hospital of the city of New York and the New York trade schools.

MORGAN, LEWIS HENRY (1818-1881), American ethnologist, was born near Aurora, New York, on the 21st of November 1818. He graduated in 1830 at Union College, then studied law, was admitted to the bar, and practised his profession with Braxton Craven at Buffalo. In 1844 Lewis H. Morgan went among the Iroquois, living as far as he could their life and studying their social organization. In October 1847 he was formally adopted into the Hawk gens of the Seneca tribe, and received the name "Ta-yah-da-wah-kugh." The fruit of his researches was The League of the Iroquois (1843; new ed. 1904), which, says J. W. Powell, was "the first scientific account of an Indian tribe ever given to the world." The success of the book encouraged him to further research, resulting in his Systems of Consanguinity and Affinity of the Human Family (1869). In 1877 he added to his reputation by publishing
MORGAN, LADY—MORGARTEN

Ancient Society, or Researches in the Lines of Human Progress from Savagery, through Barbarism, to Civilization, in which he divided the progress of culture into seven stages—"lower savagery," "middle savagery," "upper savagery," "lower barbarism," "middle barbarism," and "upper barbarism," and "civilization." The book was in four parts, dealing with (1) the growth of intelligence through inventions and discoveries; (2) the growth of the idea of government; (3) the growth of the idea of the family; and (4) the growth of the idea of property.

Morgan was a member of the New York assembly in 1861 and of the New York senate in 1868-1869. In 1880 he was president of the American Association for the Advancement of Science. He died in Rochester, New York, on the 17th of December 1881.

In addition to the works above mentioned and many magazine articles, he published The American Beaver and his Works (1868) and Houses and House-life of the American Aborigines (1881).

MORGAN, SYDNEY, LADY (c. 1783–1859), British authoress, daughter of Robert Owenson, an Irish actor, was born in 1783 in Dublin. She was one of the most vivid and hotly discussed literary figures of her generation. She began her career with a precocious volume of poems. She collected Irish tunes, for which she composed the words, thus setting a fashion adopted with signal success by Tom Moore. Her St Clair (1804), a novel of Irish life, was well received, and her next novel, the Irishwoman (1807), a continuation of the life of a female friend of Miss Morgan, was received with great favor. Her O'Beire (1817) and Irish Novels, Poetry, and Elaborate and Practical Sketches and Metrical Fragments followed in 1857. Miss Owenson entered the Household of the marquess of Abercorn, and in 1812, persuaded by Lady Abercorn, she married the surgeon to the household, Thomas Charles Morgan, afterwards knighted; but books still continued to flow from her facile pen. In 1814 she produced her best novel, O'Donnell. She was at her best in her descriptions of the poorer classes, of whom she had a thorough knowledge. Her elaborate study (1817) of France under the Bourbons was attacked with outrageous ferocity. In the Quarterly, the authors being accused of Jacobinism, falsehood, licentiousness and impiety. She took her revenge indirectly in the novel of Florence Macarthy (1818), in which a Quarterly reviewer, Con Crawley, is insulted with supreme feminine ingenuity. Italy, a companion work to her France, was published in 1821; Lord Byron bears testimony to the justness of its pictures of life. The results of Italian historical studies were given in her Life and Times of Salvador Rosa (1825). Then she turned again to Irish manners and politics with a matter-of-fact book, Absenteeism (1825), and a romantic novel, The O'Brien and the O'Flahertys (1827). From Lord Melbourne Lady Morgan obtained a pension of £300. During the later years of her long life she published The Book of the Boudoir (1829), Dramatic Scenes from Real Life (1833), The Princess (1835), Woman and her Master (1840), The Book without a Name (1841), Passages from my Autobiography (1858). She died on the 14th of April 1859.

Her autobiography and many interesting letters were edited with a memoir by W. Hepworth Dixon in 1889.

MORGAN, THOMAS (d. 1743). An English deist, of Welsh extraction, became an independent minister, but soon after 1720 lost his position owing to the growing unorthodoxy of his views. He took up medicine and became a freethinker, though he describes himself as a Christian deist. He was an energetic controversialist. Among his works are Philosophical Principles of Medicine (1725); Collection of Tracts (1726), essays dealing with the Trinitarian controversy; The Moral Philosopher (1737), a dialogue between a Christian Jew, Theophratus, and a Christian deist, Philalethes. He died on the 14th of January 1743/4.

MORGANATIC MARRIAGE, a form of marriage properly peculiar to the German peoples, but also found in the royal families of other European countries. It is one in which the contracting parties are not both of equal social rank (ebenbärtig), and under which the wife, if not ebenbärtig, does not take the rank of her husband, and the children, whether it be the wife or husband that is of lower rank, have no right of succession to the dignities, fiefs or entailed property of the parent of higher rank. This equality by birth was formerly throughout Germany the necessary condition to a complete and perfect marriage, but it is now only applicable to members of reigning houses or of the higher nobility (höher Adel), and it is thus of force among the "mediatized" princes of the German Empire. In the constitution of the various states, and in the "house laws" (Hausgesetze) of the reigning families, the rules are laid down as to what constitutes ebenbärtigkeit. Generally it may be said that members of a present or former reigning house, either in Germany or Europe, would be recognized as ebenbärtig, but a former morganatic marriage would be taken as destroying the qualification. In Great Britain the regulations as to the marriages of members of the royal family are provided for in the Royal Marriage Act 1772 (see Marriage). The term "morganatic marriage" is applied generally to any marriage of a person of royal blood with one of inferior rank. The origin of the term, in medieval Latin matrimonium ad morganaticam, is usually taken to refer to the Morgengabe, i.e. the morning gift, made by a husband to his wife on marriage. The German name is Ehe zur linken Hand (marriage by the left hand, whence the phrase a "left-handed marriage"), the husband of such marriage ceremonies giving the left instead of the right hand to the bride. Such marriages are recognized as fully binding by the Church, and the children are legitimate, and no other marriage can take place during the lifetime of the contracting parties.

MORGANTOWN, a city and the county-seat of Monongalia county, West Virginia, U.S.A., on the Monongahela river, about 50 m. S.E. of Wheeling. Pop. (1890), 1011; (1900), 1893; (1910 census), 9150. The city is served by the Baltimore & Ohio and the Morgantown & Kingwood railways, and by several steamboat lines, the Monongahela being navigable to Fairmont, about 25 m. above Morgantown. Morgantown is the seat of the West Virginia University (co-educational), formed from the Monogalia Academy (incorporated, 1814) and the Woodburn Female Seminary (incorporated, 1858), and chartered in 1867 as the Agricultural College of West Virginia; in 1868 the present name was adopted. In 1908 the university had 86 instructors and 1534 students. Coal, glass-sand and limestone are found in the vicinity of Morgantown. The first settlement here was made about 1768 by the brothers David and Zackwill Morgan, and was named in honour of the latter. It was incorporated as Morgan’s Town in 1785; and in 1905 a city charter was granted to it after the annexation of Greenbloom (pop. 1900, 349), Seneca (pop. 1900, 723), and South Morgantown (pop. 1900, 405).

MORGATEN, the name of the pasture slopes that descend westwards to the south end of the lake of Aegeri in the Swiss canton of Zug, about 2 m. by road from the Sattel station on the railway line from Schwyz to Zürich. It was at the foot of these slopes and on the shore of the lake that the small Swiss force defeated the large Austrian army, advancing from Zug on Schwyz, on the 15th of November 1715, and so laid the foundations of Swiss liberty. As the battle has shrunk in the ages the exact site of the battle has been disputed. It seems most probable that it took place near the Haselmatt Chapel, in the territory of Zug, where is the official monument, but some hold that the real site was in Schwyz territory, near the old tower and battle chapel of Schornen, in the gorge between the lake and Sattel.

The original accounts of the battle are collected in part iii. (1884) of
MORGEN—MORIER, SIR R. B. D.

the Mitteilungen of the Historical Society of Swyz. See also the careful study in K. Bürkli’s Ein Denkmal am Morgarten wo ist sein Platz? (Zug, 1895).

MORGEN, a unit of measurement of land in Holland and the Dutch colonies, and hence still current in South Africa, equivalent to about 2 acres. It is also used in Prussia, Saxony and Denmark, where the area is usually about one-third of an acre. The word is possibly derived from the Greek Germa (1450), (R. 1435, inscribed) in the Vatican, and the print which represents the miracle of Bolsena is inscribed with his name. He married Volpato’s daughter, and, being invited to Florence to engrave the masterpieces of the Florentine Gallery, he removed thither with his wife in 1782. His reputation now became so great as to induce the artists of Florence to recommend him to the grand duke as a fit person to engrave the “Last Supper” of Leonardo da Vinci; apart, however, from the dilapidated state of the picture itself, the drawing made for Morgen was unworthy of the original, and the print, in consequence, although an admirable production, fails to convey a conception of the style and merit of Leonardo’s fame, however, soon extended over Europe; and the Institute of France, as a mark of their admiration of his talents, elected him an associate in 1803. In 1812 Napoleon invited him to Paris and paid him the most flattering attentions. He died at Florence on the 8th of April 1833.

A list of the artist’s works, published at Florence in 1810, comprised 200 compositions; the number was afterwards considerably increased. Amongst the most remarkable is a series of those already mentioned, may be noticed the Transfiguration from Raphael, a Magdalene from Murillo, a Head of the Saviour from da Vinci, the Car of Aurora from Guido, the Hours and the Repose in Egypt from Poussin, the Prize of Diana from Domenichino, the Monument of Clement XIII. from Canova, Theseus vanquishing the Minotaur, Francesco Moncado after Van Dyck, portraits of Dante, Petrarch, Ariosto, Tasso, and a number of other eminent men. His prints have hardly maintained the reputation which they enjoyed during the artist’s lifetime. Though carefully and delicately executed, they are somewhat mechanical and waning in force and spirit.

MORHIER, SIMON (d. c. 1450), provost of Paris during the English occupation in the 15th century, was seigneur of Gilles, near Nogent-le-Roi, in the Chartreuse country. Being a member of the duke of Burgundy’s party, he was appointed provost at Paris by Joan the Mad, Bed ford and Charles the Bold, in December 1449. He was then prisoner at the siege of Montargis in 1427, and again at the battle of Rouvray in 1429; but in September of the latter year he repulsed Joan of Arc’s attack upon Paris. After a campaign in Cotentin in 1453, he was once more taken prisoner at the bridge of Charenton in 1456. Remaining faithful to the English party, he became captain of Dreux, a councillor of Henry VI., and treasurer of France and Normandy. He assisted in the defence of Meaux (1439), of Creil and of Pontoise (1441), and must have died between 1450 and 1456.

See the Nouvelle biographie générale, vol. xxvi.; and a note on Simon Morhier in the memoirs of the Antiquarian Society of France, vol. xxv.

MORHOF, DANIEL GEORG (1639-1691), German man of letters, was born at Wismar on the 6th of February 1639. He first studied jurisprudence and then litterae humaniores at the university of Rostock, where his elegant Latin versification procured for him in 1660 the chair of poetry. In 1665 he went to the new university of Kiel as professor of eloquence and poetry; this chair he exchanged for that of history in 1673. He died at Lübeck on the 30th of July 1691. Of his numerous writings the most important are Unterricht von der deutschen Sprache und Poesie (1652; 3rd ed., 1716), the first attempt in Germany at a systematic survey of European literature, and Polyhisor, sive de auctorum notitb et rerum commentarii (Lübeck, 1688, not completed till 1707; 4th ed., 1747), a kind of encyclopaedia of the knowledge and learning of his time.

See Eymer, Morhof und sein Polyhisor (in the Xenia Austriaca, Vienna, 1803); and biography by R. v. Lillenron in Allgemeine Deutsche Biographie (1852).

MORIAH, an obscure place-name of ancient Palestine with apparently two distinct connotations. (1) A land entirely unknown, except on a mount in which Abraham offered Isaac (Gen. xxxii. 2). The text is probably corrupt: some have suggested “land of the Amorites,” others “land of Midian.” The etymology of the word is equally obscure. Traditionally, of course, “the land of Moriah” is identified with the site of the Temple at Jerusalem, except by the Samaritans and a few western scholars (such as Dean Stanley) who accept their belief that the mountain was Gerizim. (2) The upper part of the hill of Ophel, the threshing floor of Araunah, upon which Solomon erected the Temple, is once called Mount Moriah (2 Chron. iii. 1). Whether the name be derived from the corruption in Genesis or not cannot be definitely decided; it very likely is. The testimony of Josephus, who often names the temple hill “Moriah,” is of course not original, and of no weight. (R. A. S. M.)

MORIER, JAMES (1780-1849), English traveller and author, was born in 1780. Through the influence of his uncle, Admiral William Waldegrave, Baron Radstock, he entered the diplomatic service, and as secretary to Lord Elgin followed the grand vizier in the Egyptian campaign. An account of his Eastern experiences was published in 1812, under the title A Journey through Persia, Armenia and Asia Minor to Constantinople in 1808-9. From 1810 to 1816 he was the British representative at the court of Persia, and after his return he published A Second Journey through Persia to Constantinople between the years 1810 and 1816. His knowledge of Eastern life and manners he also turned to account in the composition of several entertaining romances. The most popular of these were The Adventures of Hajji Baba of Ispahan (1824), The Adventures of Hajji Baba of Ispahan in England (1828), Zohrab the Hostage (1832), and Ayesha the Maid of Kars (1834). Morier died at Brighton on the 23rd of March 1849.

MORIER, SIR ROBERT BURNETT DAVID (1826-1893), British diplomatist, was born at Paris on the 31st of March 1826. He was descended from a family of diplomatists of Huguenot origin, the best known of whom were his father David, consul-general for France and minister at Bern, and his uncle James, the author of The Adventures of Hajji Baba. After a somewhat defective private education he came up to Balliol College, Oxford. Here he attracted the notice of Jowett, under whose influence his brilliant but wayward mind obtained the discipline of which it was in need. The relation of tutor and pupil, initiated into a friendship of rare warmth. Writing towards the close of his life, Jowett, who inspired more devoted friendships than any man of his time, spoke of Morier as his kindest and best friend for forty-five years. On leaving Oxford, Morier at first obtained an appointment in the Education Department, but resigned in 1852, and in the following year became attached at Vienna. In the succeeding years he was attached in turn to almost every court in Germany. Restless in temperament and unconventional in method, he plunged into the vortex of German politics to a degree that did not always accord with the traditions of diplomacy. The most important years of his career in Germany were from 1866 to 1871, when he was secretary of legation at Darmstadt. Here he became a trusted adviser of the crown princess, and through her acquired an intimate friendship with the crown prince (afterwards the emperor Frederick III.), whose antagonism to Bismarck’s reactionary policy met with cordial support from Morier’s sturdy Liberalism. Bismarck, already jealous of British influence at court, honoured Morier with a hatred not lessened by the fact that Morier’s knowledge of German politics was unrivalled outside Germany. On leaving Darmstadt, Morier became chargé d’affaires, first at Stuttgart, then at Milan, Venice, and Rome. In 1877 he was appointed chargé d’affaires at Constantinople; and in 1880 he became British envoy at the court of Turkey. Morier was a consistent and zealous supporter of the British attitude throughout the危机战争, and his services for the government were much appreciated. On retiring from the diplomatic service in 1883 he was made a knight of the Garter. Morier’s published works include Travels in Damascus and Jerusalem in 1857, From Constantinople to the mountains of Armenia in 1857, A Journey through the Ottoman Empire (2 vols., 1858), and The Speech of the Sultan of Turkey in Parliament (1881). He died at Oxford on the 22nd of October 1893.

1 Some of the sects transfer the scene of the sacrifice to the “Chapel of Abraham” in the precincts of the Holy Sepulchre.
and then at Munich, and in 1876 was appointed minister at Lisbon. From 1881 to 1884 he was minister at Madrid. In December 1884 he became ambassador at St Petersburg, and almost immediately had to face the alarming situation created by the Russian advance to Penjdeh. Thanks to his efforts, a war that at one moment seemed inevitable was averted. His great popularity at the Russian court contributed towards a marked improvement in the relations between the two countries. Bismarck took alarm at the lessening influence of Germany over Russia, and tried to procure Morier’s downfall. The Königliche Zeitung declared in December 1888 that Morier had made use of his position at Darmstadt during the Franco-German War to betray the movements of the German troops to Marshal Bazaine. The authority for this charge was an alleged declaration made by Bazaine to the German military attaché at Madrid. Bazaine had died in September, but Morier had heard rumours in July of the charge brought against him, and had procured from Bazaine a written denial, which he now published in The Times. Apart from this, it was clearly shown that Morier could not have transmitted the information by the alleged date, and that Bazaine, according to the testimony of his own books and of other officers, received the information in question by reports from the front. As a matter of fact, Morier was an ardent champion of the German cause. His correspondence with Jowett shows the latter vainly endeavouring to convince his friend that the French were in the right. Public opinion everywhere, except in the German Conservative press, attributed the charge to political motives. Morier’s wealth at his disposal enabled him to be appointed Lord Dufferin’s successor at Rome in 1891; but it was felt that he could not be spared from St Petersburg, and there he remained till forced to find a milder climate. It was then too late, and he died at Montreux in Switzerland on the 16th of November 1893.

MORIKE, EDUARD FRIEDRICH (1804–1875). German poet, was born at Ludwigsburg on the 8th of September 1804. In 1834 he was appointed pastor of Kleversbach near Weißenburg, and in 1837 became professor of literature at the Katharinenstift in Stuttgart. This office he held until his retirement in 1866, but he continued to live at Stuttgart until his death on the 4th of June 1875. Morike is the most lyrically gifted of all the poets belonging to the so-called Swabian school which gathered round Uhland. His poems, Gedichte (1838; 2nd ed., 1845), are mostly lyrical, graceful in style, original in conception, often humorous, but expressed in simple and natural language. He also wrote a somewhat fantastic Idylle vom Bodensee, oder Fischer Martin und die Glockendiene (1846; 2nd ed., 1836), and published a collection of hymns, odes, elegies and Idylls of the Greeks and Romans, entitled Romanische Blumen (1846), and several short stories and narratives among the former Mater Nalen (1852; 6th ed., 1901), which enjoyed great popularity. Morike’s Gesammelte Schriften were first published in 4 vols. (1879); the most recent editions are those edited by R. Krauss (6 vols., 1905), and the Volksausgabe, published by Gösch (4 vols., 1905). Selections from his literary remains were published by R. Krauss in Eduard Morike als Gelehrtenstifte (1895), and his correspondence with Hermann Kurz, Moritz von Schwind, and Theodor Storm, by J. Bächold (1885–1891; an edition of Morike’s Auseinandersetzungen with Gösch, 1902–1904; see F. Moritz, Eduard Morike (1881); R. Fischer, Eduard Morike (1901); H. Maync, E. Morike (1904); and F. Moritz, F. Morike’s künstlerisches Schaffen and dichterische Schöpfungen (1903).

MORILLON, a name commonly given by fowlers to the female or immature male of the Golden-Eye (q.v.), the Clangula glauca of modern ornithology, under the belief—which still very generally obtains among them—of its origin from the Black Moorish (q.v.), a bird of brim, the Green-Eye, whose plumage was not assumed until the second year. The word is used in Italy by Morier’s father in the same form, but it is in that language applied to the Tufted Duck, Fuligula cristata, and is derived, according to Littre, from more, signifying black. (A. N.)

MORIN, JEAN (Latinized Joannes Morinus) (1501–1659). French theologian, was born in 1501 at Blois, of Protestant parents. He learned Latin and Greek at Rochelle, and continued his studies at Leiden, subsequently removing to Paris. His conversion to the Roman Church is ascribed to Cardinal de Perron. In 1618 he joined the congregation of the Oratory, and in due course took priest’s orders. In 1625 he visited England as the train of Henrietta Maria; in 1640 he was at Rome, on the invitation of Cardinal Barberini, and was received with special favour by Pope Urban VIII. He was, however, soon recalled to Paris by Richelieu, and the rest of his life was spent in incessant literary labour. The Histoire de la délivrance de l’église chrétienne par l’emp. Constantin, et de la grandeur et souveraineté temporelle donnée à l’église romaine par les rois de France (1630) gave great offence at Rome, and a Déclaration (1644), directed against faults in the administration of the Oratory, was strictly suppressed. So, too, his great work on penance gave equal offence to the Jesuits and to Port-Royal, and even after his death, in 1659, the polemical vehemence of his Exercitationes biblicae, and the exaggeration of his assertion “apud notericos Haereticos verba Scripturarum non esse integra, non superficiem, non folia, nuda sensum, medullam et radicum rationis” long led Protestants to treat his valuable contributions to the history of the Hebrew text as a mere utterance of Popish prejudice.

Morin was a voluminous and prolific writer on ecclesiastical antiquities. His principal works in this field are Commentarius historicus de Scripturis et Litteris in administratione sacrae, in which he for the first time gives a history of the MSS., and a text of the Bible, “Utrumque caput,” (1651), and Comm. de sacrarum ecclesiasticae originibus and consuetudines antiquae et recentiores (1655), which expresses those irenic views on the subject of ordination which recommended Morin to Urban VIII. The literary correspondence of Morin appeared in 1682 under the title of Antiquitates ex orientalibus, edited by R. Simon.

Morin’s chief fame, however, rests on his biblical and critical work. By his edito princeps of the Samaritan Pentateuch and Tar-gums (1680; Paris 1753), and his commentary on the Bible, a study of this dialect, which he acquired without a teacher (framing a grammar for himself) by the study of MSS., then newly brought to Europe. Not unnaturally he formed a very exaggerated view of the value of the Samaritan tradition of the text (Exercitationes in utrumque Samaritanorum Pentateuchum, 1631). A similar tone of exaggerated depreciation of the Massoretic Hebrew text, coloured by polemical bias against Protestantism, marred his greatest work, the posthumous Exercitationes biblicae de hebraeis graecis textus sincere (1660), in which, following in the footsteps of Cappellus, but with incomparably greater learning, he brings irrefragable arguments against the then current theory of the abhorrent integrity of the Hebrew text and the antiquity of the vowel points.

MORION (the French form of a word occurring in Spanish as morrón, Ital. morione, usually connected with the Spain word for a top or crown of the head), a light round-shaped head-piece or helmet (q.v.). The chief characteristics are a brim, an upright comb running along the crown from back to front, and the absence of guards for the face, ears or neck. The brim was bent sharply upwards at the front and back, and the piece was generally worn tilted backward so as to cover the neck. The morion and the cabasset, a peaked-shaped headpiece with a flatter brim and no comb, were the typical infantry helmets of the 16th and early 17th centuries. It was sometimes worn unaccompanied by any body armour.

MORISCOS (i.e. little Moors), the name given to the Spanish Mahommedans who accepted baptism and their descendants. Many, if not most, of them were in reality of the same race as the Christians, and were descended from converts to Islam. Those Mahommedans who retained their religion under Christian rulers were known as Mudéjars, a word of Arabic origin which has been interpreted as meaning “those who remained” or “were left.” Until the 17th century they were numerous, and enjoyed free exercise of their religion, which was secured to them by capitulations and treaties. Their number had been constricted by the conquest of Granada in 1492. By the terms of the capitulation of the city freedom of worship was secured to the Mahommedans. But the policy of the Catholic sovereigns, who desired to establish unity of faith
among their subjects, and the influence of the Church, soon led to violations of the treaty. The first Christian archbishop of Granada, Talavera, made some progress in converting the people peacefully. But at the end of 1499 Cardinal Jiménez insisted on adopting coercive measures. A rebellion ensued, and the Mahommedans were suppressed. Want of power, or other obstacles, delayed the final extinction of tolerated Mahommedanism in all parts of Spain, but by 1525 it was everywhere suppressed. The last remains of it were crushed in Valencia, where the Mahommedans were furiously attacked by the Christian peasantry during the great agrarian revolution, which was not ended till 1532. As they were dependent on the protection of the landlords, the Mahommedans were docile tenants, and their competition weighed heavily on the Christians. The same quality of industry remained to the Moriscos, and excited the envy of their Christian fellow countrymen. The feelings with which they were regarded are admirably shown by Cervantes (who shared them to the full) in his "Conversation of the Two Dogs." In 1568 the government of Philip II. issued an edict, which ordered them to renounce all their Moorish ways of life and to give up their children to be educated by Christian priests. The result was a rebellion in Granada, which was put down with great difficulty. The Moriscos were expelled from Granada and scattered over other parts of Spain. Many fled to Africa, where the more spirited among them took to piracy at Algiers and other ports. They still maintained relations with their kinsfolk in Spain, and the whole coast suffered from their incursions. The Moriscos entered into relations with other enemies of Spain, and notably, with France. Henry IV. included a plan for supporting a Morisco rebellion in the great scheme for the destruction of the Spanish monarchy, which he was about to put into execution when he was murdered on the 14th of May 1610. These intrigues were known to the Spanish government and inspired it with terror. The expulsion of the whole body of Moriscos was decided on in 1608, and the edict was published on the 22nd of September 1609. The expulsion was carried out with great cruelty. The number driven out has been variously estimated at 120,000 or at 3,000,000. In some known cases the expelled Moriscos suffered martyrdom in Africa as Christians. A few were left in Spain as domestic slaves, and some contrived to return in secret. Catholicism and Mahommedanism continued to come before the Inquisition till the 18th century.

MORISON, JAMES AUGUSTUS COTTER (1832—1888), British author, was born in London on the 20th of April 1832. His father, who had made a large fortune as the inventor and proprietor of "Morison's Pills," settled in Paris till his death in 1840, and Cotter Morison thus acquired not only an acquaintance with the French language, but a profound sympathy with France and French institutions. In later life he resided for some years in Paris, where his house was a meeting-place for eminent men of all shades of opinion. He was educated at Highgate grammar school and Lincoln College, Oxford. Here he fell under the influence of Mark Pattison, to whom his impressionable nature perhaps owed a certain over-faithfulness that characterized his whole career. He also made the acquaintance of the leading English Positivists, to whose opinions he became an ardent convert. Yet he retained a strong sympathy with the Roman Catholic religion, and at one time spent several weeks in a Catholic monastery. One other great influence appears in the admirable Life of St Bernard, which he published in 1863—that of his friend Carlyle, to whom the work is dedicated, and with whose style it is strongly coloured. Meanwhile he had been a regular contributor, first to the Literary Gazette, edited by his friend John Morley, and then to the Saturday Review at its most brilliant epoch. In 1868 he published a pamphlet entitled Irish Grievances shortly stated. In 1878 he published a volume on Gibbon in the "Men of Letters" series, marked by sound judgment and wide reading. This he followed up in 1882 with his Macaulay in the same series. It exhibits, more clearly perhaps than any other of Morison's works, both his merits and his defects. Macaulay's bluff and strenuous character, his rhetorical style, his unphilosophical conception of history, were entirely out of harmony with Morison's prepossessions. Yet in his anxiety to do justice to his subject he steeped himself in Macaulay till his style often recalls that which he is censuring. His brief sketch, Mme de Maintenon: une étude (1885), and some magazine articles, were the only fruits of his labours in French history. Towards the close of his life he meditated a work showing the application of Positivist principles to conduct. Unhappily, he failed to carry out his plan before he was called to his second or constructive part: the first, a brilliant piece of writing which attempts to show the ethical inadequacy of revealed religion and is marked in parts by much bitterness, was published in 1887 under the title of The Service of Man. He died in London on the 26th of February 1888.

MORITZ, KARL PHILIPP (1757—1793), German author, was born at Hameln on the Weser on the 15th of September 1757, of humble parentage. After receiving a scanty schooling, he was apprenticed to a hat-maker, but was later enabled to study at Berlin and Wittenberg and in 1777 became teacher in a school at Dessau. While on a tour through Italy in 1786 he became acquainted with Goethe, who interested himself in him. On his return, he was appointed professor of archaeology and aesthetics, at the academy of art in Berlin, and in this city he died on the 26th of June 1793. Of Moritz's writings on aesthetic, archaeological and philosophical subjects, the little treatise Über die bildende Nachahmung des Schönen (1788; reprinted 1888) and Die Götterleute (1791; 1st ed., 1855, a reprint in Reclam's Universalbibliothek, 1878) are important; interesting, but perhaps, are the accounts of his travels, Reisen eines Deutschen in England (1788; reprints 1803, 1839), also two volumes of Reisen eines Deutschen in Italien (3 vols., 1792—1793). As an author he is best known by his two novels, Anton Reiser (1785—1790; new ed. by L. Gelger, 1886) and Andreas Hartknoepf (1786), which are mainly autobiographical.

See K. F. Klischnig, Erinnerungen aus den zehn leisten Lebensjahren meines Freundes Anton Reiser (1794); Varnhagen von Ense, Denkwürdigkeiten, vol. iv. (1838); and M. Dessoir, Karl Philipp Moritz als Autor (1889).

MORLAIX, a town of western France, capital of an arrondissement in the department of Finistère, 27 m. E.N.E. of Brest on the railway to Rennes. Pop. (1906), 13,875. Morlaix lies between 4 and 5 m. from the English Channel in a narrow valley where two small streams unite to form the Dossen, the channel of which forms its port. Below the town the river widens into an estuary, the mouth of which is commanded by an old fortress, the Château du Taureau, built in 1542 to protect the town against the English. The railway from Paris to Brest crosses the valley on a striking two-storeyed viaduct some 200 ft. above the quays. Morlaix contains a considerable number of wooden houses of the 15th, 16th and 17th centuries. These have large covered courts, with huge open fireplaces and carved wooden staircases, supported on pillars, leading from the court to the upper storeys.

Morlaix has a sub-prefecture, tribunals of first instance and of commerce, a chamber of commerce, and colleges for boys and girls. The industries include the manufacture of tobacco occupying about 900 hands, tanning, brewing and the manufacture of casks, wooden shoes and candles; there is an active trade in grain, butter, oil-seeds, vegetables, leather, wax, honey and in horses and other livestock, which are exported by sea. The port, consisting of an outer tidal harbour and an inner basin, admits vessels drawing 27 ft. at spring tides and 12 ft. at neap tides.

Judging by the numerous coins found on the spot, the site of Morlaix was probably occupied in the time of the Romans. The counts of Leon held the lordship in the 12th century, but the dukes of Brittany disputed possession with them, and in 1187 Henry II. of England, guardian of Arthur of Brittany, made himself master of the town after a siege of several weeks. During the Hundred Years' War Morlaix was held by the French and the English in turn, and pillaged by the latter in 1522.
Mary of Scots, on her way to be married to the dauphin, made solemn entry into Morlaix in 1548. The town having joined the League, the castle was taken by storm in the name of Henry IV. in 1594.

MORLAND, GEORGE (1763-1804), English painter of animals and rustic scenes, was born in London on the 26th of June 1763. His grandfather, George H. Morland, was a subject painter, three of whose popular pictures were engraved by Watson and Dawe in 1766. The son, H. R. Morland, father of George, was also an artist and engraver, and picture restorer, at one time a rich man, but later in reduced circumstances. His pictures of laundry-maids especially were very popular in their time, and were reproduced in mezzotint. They represented ladies of some importance who desired to be painted, according to the fashion of the day, engaged in domestic work. Morland's mother was a Frenchwoman, who possessed a small independent property of her own; she is believed to have been the Maria Morland who exhibited twice at the Royal Academy in 1785 and 1786, although some writers have stated that Maria Morland was not the mother, but one of the sisters of George Morland.

At a very early age Morland produced sketches of remarkable promise, exhibiting some at the Royal Academy in 1773, when he was but ten years old, and continuing to exhibit at the Free Society in 1775 and 1776, and at the Society of Artists in 1777, and then sending again to the Royal Academy in 1778, 1779 and 1780. His very earliest work, however, was produced even before this. He was placed on his father's picture, and he had executed a drawing which the boy had executed when he was but four years old, representing a coach and horses and two footmen. He was a student at the Royal Academy in early youth, but only for a very short time. From the age of fourteen he was apprenticed to his father for seven years, and by means of his talent appears to have kept the family together. He had opportunities at this time of seeing some of the greatest artists of the day, and works by old masters, but even then a strange repugnance for educated society showed itself, and no persuasion, for example, could ever allure him within reach of the Angerstein gallery, where he would have been a welcome visitor. Before his apprenticeship came to an end, Romney offered to take Morland into his studio for three years, with a salary of £300 a year, but the offer was rejected, and as soon as his freedom came, he left his dull, respectable home, with its over-strict discipline, and began a career of reckless profligacy which has hardly a parallel in art biography. In 1785 he was in France, whither his fame had preceded him, and where he had no lack of commissions, and in the following year he married Anne, the sister of William Ward, the engraver, and settled down in High Street, Marylebone.

Mrs Morland was a beautiful and virtuous woman, and throughout the whole of her husband's profligate career was deeply attached to him. It was at this time that he painted the six pictures known as the Laetitia series, engraved by J. R. Smith, and, just preceding his marriage, four other didactic works, "The Idle and the Industrious Mechanic" and "The Idle Laundress and the Industrious Cottager," engraved by Blake, had been produced by him. Shortly after his marriage Morland resided at Pleasant Passage, Hampstead Road, and at that time his reputation was rapidly increasing, while he was the sole venturer of his own productions, his expenditure, although very extravagant, was not beyond his income. Soon, however, he moved to Warren Place, and there, although he was making a thousand a year by his pictures, he lived at such an expensive rate that he began the series of financial difficulties which finally ruined him. His wild frolics about town, and the prodigal line of conduct upon which he had entered, resulted in a heavy accumulation of debt, but in 1787 he set himself to clear off his encumbrances, and did so in fifteen months. He then removed to Leicestershire Square, later to Tavistock Row, then to St Martin's Lane, and finally to Paddington, and was at that time at the very height of his reputation.

After moving to a larger house in Winchester Row, his financial position became so embarrassed that he had to fly from his creditors into Leicestershire, where he indulged to the full his delight in animal life. After a year or two, however, he returned to London and settled in Charlotte Street, when his difficulties increased, and time after time he had to obtain letters of licence, in order to avoid being arrested by his creditors. At last, however, he had to cross the water, and change his place of abode from time to time, keeping it as secret as possible, and we hear of him at Lambeth, at East Sheen, in the Minorkeys, Kentish Town, St. John's Wood, Paddington Green and Hackney, while he had numerous adventures in eluding the attention of those who desired to capture him.

In 1799 he escaped to the Isle of Wight, and settled down for some time at Yarmouth, but returned to London at the end of the year, was arrested and sent to King's Bench prison, where he lived within the rules, occupying a small furnished house in St George's Fields, but keeping his exact residence a secret. In 1802 he was liberated, but in 1803 had to place himself in the custody of the Marshalsea, in order to avoid his creditors. Afterwards he visited Brighton and other places, and by his riotous living brought himself to such a state of health that fits of an apoplectic nature became frequent, and he was for a time paralysed. On the 19th of October 1804 he was arrested by a publican and conveyed to a sponging-house, where, in attempting to make a drawing which could be sold in discharge of the debt, he was seized with a fit which proved the beginning of brain fever. He died on the 29th of the same month. His wife survived him only three days, the news of his death bringing on convulsive fits from which she recovered, but died a few years later. Their two sons, J. R. Smith, W. Ward, P. Dawe, G. Keating, S. W. Reynolds and other engravers. He exhibited regularly at the Royal Academy from 1784 down to 1804, but few of his academy pictures can be identified owing to the inadequate description of them afforded by their titles.

Four biographies of him appeared shortly after his death, written by W. Collins (1805), F. W. Bladon (1806), J. Hassell (1806) and George Dawe (1807). Later biographies are those by Ralph Richardson (1895), J. T. Nettleship (1896) and G. C. Williamson (1904 and 1907).

MORLANWELZ, a town of Belgium in the province of Hainaut, 15 m. E. of Mons. It lies in the centre of the coal-mines district and has extensive foundries and ironworks. Pop. (1904), 8200.

MORLEY, BARONS AND EARLS OF,—In 1299 William de Morley of Morley in Norfolk was summoned to parliament as a baron, and his son Robert (d. 1360) was a celebrated warrior, being largely responsible for the English victory at Sluys and fighting at Cressy. His descendant Robert, the 6th baron (d. 1443), had no sons, but he left a daughter Alienore, who married William Lovel (d. 1470), and Lovel was the 7th baron, married to the daughter and coheiress of John Lovel, and was created baron by Edward IV. as Lord Morley, ranking as the 9th holder of the title. He left a son Henry, who was killed in 1480, and Henry's heir was his sister Alice, the wife of Sir William Parker (d. 1510), hereditary marshal of Ireland. Their son Henry Parker (1476-1556) became the 10th baron, as he was summoned to the House of

Henry (d. 1653) died during his father's lifetime, leaving a son Henry (d. 1577) who became 11th Baron Morley on his grandfather's death. His son Edward (d. 1618), one of the proctors of Mary Queen of Scots, succeeded to the barony; and Edward's son and successor was William Parker, 4th Lord Montague (q.e.)

The barony of Morley remained united with that of Montague until the death of William's grandson Thomas about 1686, when it fell into abeyance.

John Parker, 1st earl of Morley (1772–1840), only son of John Parker (1735–1788), who was created Baron Boringdon in 1784, but was no relation of the previous barons Morley, was a prominent supporter of Pitt and of Canning. In 1815 he was created earl of Morley. He was a public benefactor to Plymouth and its neighbourhood. He was succeeded by his son Edmund Henry Parker (1810–1864), whose son, Albert Edmund, the 3rd earl (1843–1905), was chairman of committees in the House of Lords from 1889 to 1905, after having been under-secretary for war and first commissioner of works. In 1905 his son, Edmund Robert (b. 1877), became 4th earl.

MORLEY, GEORGE (1597–1684), English bishop, was born in London and educated at Westminster and Oxford. In 1640 he was presented to the sinecure living of Hartfield, Sussex, and in the following year he was made canon of Christ Church and evacuated the position of Master in Literae Humane. He proceeded before the Commons in 1642, but his sermon gave offence, and when in 1647 he took a prominent part in resisting the parliamentary visitation of Oxford University he was deprived of his canony and living. Leaving England he joined the court of Charles II., and became one of the leading clergy at the Hague. Shortly before the Restoration he came to England on a highly successful mission to gain for Charles the support of the Presbyterians. In 1660 he regained his canony, and soon became dean of Christ Church. In the same year he was consecrated bishop of Worcester. At the Savoy conference of 1661 he was chief representative of the bishops. He was translated to the see of Winchester in 1662. His works are few and chiefly polemical, e.g. The Bishop of Worcester's Letter to a friend for Vindication of himself from the Calumnies of Mr Richard Baxter (London, 1662).

MORLEY, HENRY (1822–1894), British man of letters, was born in London on the 15th of September 1822. After unhappy experiences at English schools, he was sent to the Moravian school at Neuwied, whose system strongly influenced his subsequent theories of education. It was intended that he should follow his father's profession of medicine, and in 1844 he bought a share in a practice at Madeley, Shropshire. Plunged into debt by his partner's dishonesty, he set up a small school for young children at Liscard, near Liverpool. His principle was to abolish all punishment, to make his pupils regard their work as interesting instead of repellant, and to form their character by appealing exclusively to higher motives. This scheme, carried out with much ingenuity, proved a complete success. Meanwhile he had devoted his spare time to writing. His contributions to magazines attracted the notice of Charles Dickens, on whose invitation he undertook to write the book of the play, arriving at the place. He was a regular contributor to Household Words. He was also on the staff of the Examiner, which he edited from 1861 to 1867. Meanwhile he had devoted much research to a life of Palissy the Potter (1852), which was at the same time a picture of life in medieval France. Encouraged by its favourable reception, he followed it up with lives of Jerome Cardan (1854) and Cornelius Agrippa (1856), and subsequently of Clement Marot (1870). His dramatic criticisms were reprinted in 1866 under the title of The Journal of a London Playgoer, 1842–1866. In 1857 he was appointed evening lecturer in English literature at King's College, and in 1865 became, in succession to David Masson, professor of English literature at University College, London. His First Sketch of English Literature (1873), a comprehensive and useful manual, reached its 34th thousand during the author's lifetime. He published in 1864 the first volume of a monumental history of English literature entitled English Writers, which he eventually carried in eleven volumes down to the death of Shakespeare. He was indefatigable as a popularizer of good literature. After editing a standard text of Addison's Spectator, he brought out a vast number of classics at low prices in Morley's University Library, Cassell's National Library, and the Carisbrooke Library. His ready speech, retentive memory, earnest purpose, and bright style made him perhaps the most popular lecturer of his day. His teaching work at University College was marked by equally extraordinary success. In 1882 he accepted a post that made great calls on his time and energy—the principalship of University Hall. This institution was partly a place of residence for students of University College, and partly the home of Manchester New College. During this time he rendered further services to the cause of education in London not only by his work on the council of University College, but by his advocacy teaching university for London. In 1889 he resigned the principalship of University Hall and his professorship at University College, and retired to Carisbrooke, Isle of Wight, intending to devote his leisure to the completion of the great task of his life, English Writers. But with his work only half achieved he died on the 14th of May 1894.

MORLEY [of BLACKBURN], JOHN MORLEY, Viscount (1858– ), English statesman and author, was born at Blackburn on the 24th of December 1858, being the son of Jonathan Morley, MP for Blackburn, and afterwards M.P. for Shrewsbury. He was educated at Christ Church, Oxford, in 1876, and after taking his degree in 1879 came up to London with the determination of seeking distinction by literature. He immediately became editor of the moribund Literary Gazette, which not all his ability could preserve from extinction. Gradually, however, he became known as a philosopher and a Radical, and as one of the ablest and most incisive contributors to the literary and political press of the day. His sympathies as a thinker seem to have been at this time chiefly with Positivism, though he never embraced Comte's doctrine in its hierarchical aspects; but he acquired a reputation as an agnostic, which became confirmed in the public mind, by his somewhat aggressively spelt God in one of his essays with a small "g." In 1868 he was editor for a short time of the daily Morning Star, which came to an end in 1870. In 1867 he succeeded G. H. Lewes in the editorship of the Fortnightly Review, which he conducted with brilliant success until 1883, when he was elected to parliament; he then assumed in exchange, but not for long, the lighter duties of the editorship of Macmillan's Magazine. He had been connected with Messrs Macmillan since the commencement under his editorship, in 1875, of the "English Men of Letters" series, a collection of biographies of various merit, in which nothing is better than the editor's own contribution in his Life of Edmund Burke, itself an extension of his article in the 10th edition of this encyclopaedia (1876). Since 1886 he had also been editor of the Pall Mall Gazette, which had been turned into a Liberal paper (see Newspapers).

In 1883 Mr Morley, who had twice unsuccessfully attempted to enter parliament, was returned for Newcastle-upon-Tyne at a by-election. The prestige thus acquired led to his presiding over a great Liberal congress at Leeds in the same year; and, although the platform was never to his liking, the literary finish of his style and the transparent honesty of his reasoning rapidly gained him a prominent position in the House of Commons. When, in February 1888, Mr Gladstone returned to office as a Home Ruler, Mr Morley, who had never before held any public appointment, filled one of the most important posts in the cabinet as secretary for Ireland. He had always expressed his sympathy with the Irish Nationalist movement. He had no opinions to recant, no pledges to explain away. He is credited with an especial influence over Mr Gladstone in the matter of Home Rule, and in particular with having kept him steady in the Bill of 1886 to his original purpose of entirely separating the Irish from the British legislature, a provision which pressure
from their own party afterwards compelled both of them to abandon. After the severe defeat of the Gladstonian party at the general election of 1868, Mr Morley, instead of a divided but strong politicians and letters until Mr Gladstone's return to power in 1892, when he resumed his former office. He had been re-elected for Newcastle in circumstances entirely honourable to himself, a determined attempt having been made to exclude him in consequence of his resistance to an Eight Hours' Labour Bill, of which he disapproved as an undue interference in principle with the rights of adult labour. His constituents showed their appreciation of his integrity by returning him with a majority of 1739; but the resistance to his views on the labour question went on, and the Dominicans and Josephites, more consistent than the general lines of Mr Morley's somewhat doctrinaire and anti-Imperialist views on politics. The result was that at the election of 1895 he lost his seat, but soon found another in Scotland, for the Montrose Burghs. He had during the interval taken a leading part in parliament, but his tenure of the chief secretariatship of Ireland was hardly a success. The Irish gentry, of course, made things as difficult for him as possible, and the path of an avowed Home Roler installed in office at Dublin. Chief Justice, his appointment was followed by an agitation which agitated the Liberal party during Lord Rosebery's administration, and afterwards, Mr Morley sided with Sir William Harcourt, and was the recipient and practically co-signatory of his letter resigning the Liberal leadership in December 1898.

Mr Morley's activities were now again turned to literature, the political views most characteristic of him, on the Boer war in particular, being practically swamped by the overwhelming predominance of Unionism and Imperialism. His occasional speeches, however, denouncing the Government policy towards the Boers and towards the war, though not representing the popular side, always elicited a respectful hearing, if only for the eloquence of their language and the undoubted sincerity of the speaker. As a man of letters his work was practically concluded at this period, and may briefly be characterized. His position as a leading English writer had early been determined by his monographs on Voltaire (1872), Rousseau (1873), Diderot and the Encyclopaedists (1875), Burke (1876), and Walpole (1886). Burke as the champion of sound policy in America and (as Mr Morley deems) of justice in India, Walpole as the pacific type, Burke in the public interest, are recognized by his monographs. In his Life of Oliver Cromwell (1900) revises Gardiner as Gardiner revised Carlyle. The Life of Cobden (1881) is an able defence of that statesman's views rather than a critical biography or a real picture of the period. Mr Morley's contributions to political journalism and to literary, ethical and philosophical criticism were numerous and valuable. They show great individuality of character, and recall the personality of John Stuart Mill, with whose mode of thought he had many affinities. As in letters, so in politics. A philosophically Radical of a somewhat mid-19th-century type, and highly suspicious of the later opportunistic reaction (in all its forms) against Cobdenite principles, he yet retained the respect of the majority whom it was his usual fate to find against him in English politics by the indomitable consistency of his principles and by sheer force of character and honesty of conviction and utterance. After the death of Mr Gladstone Mr Morley was principally engaged upon his biography, until it was published in 1903. Representing as it does so competent a writer's skilful mass of material, the Life of Gladstone was a masterly account of the career of the great Liberal statesman; traces of Liberal bias were inevitable but are vanishingly slight. He is a most serene, a most capable, and a full appreciation of Mr Gladstone's powerful religious interests from such a quarter, the whole treatment is characterized by sympathy and judgment. Among the coronation honours of 1902, Mr Morley was nominated an original member of the new Order of Merit; and in July 1902 he was presented by Mr Carnegie with the late Lord Acton's valuable library, which, on the 20th of October, he in turn gave to the university of Cambridge.

When Sir Henry Campbell-Bannerman formed his cabinet at the end of 1905 he was made secretary of state for India. In this position he was conspicuous in May 1907 and afterwards for his firmness in sanctioning extreme measures for dealing with the outbreak in India of alarming symptoms of sedition. Though he was bitterly attacked by some of the more extreme members of the Radical party, on the ground of belying his democratic principles in dealing with India, his action was generally recognized as combining statesmanship with patience; and, though uncompromising in his attitude towards revolutionary propaganda, he showed his popular sympathies by appointing two distinguished native Indians to the council, and taking steps for the protection of the native press and the suppression of native disputation. Mr Henry Campbell-Bannerman resigned in 1908 and Mr Asquith became prime minister, Mr Morley retained his post in the new cabinet; but it was thought advisable to relieve him of the burden imposed by a seat in the House of Commons, and he was transferred to the upper house, being created a peer with the title of Viscount Morley of Blackburn. His subsequent career at the India office will always be associated with his extensive remodelling (1908-1909) of the system of government in India so as to introduce more fully the representative element (see India). At the time of this work was published the disputation between the preparation and execution of Lord Morley's scheme were carried through by him with a statesmanlike and philosophic detachment, and in a spirit of balanced reason, which earned for him the increased respect of all parties in the state. (H. Cm.)

MORLEY, S.—MORLEY, T.

MORLEY, SAMUEL (1809—1886), English manufacturer and politician, was born at Homerton, not then a part of London, on the 15th of October 1809, the youngest son of a Nottingham hosier. His father, John, and his uncle, Richard, were the founders of the already prosperous Nottingham firm of J. & R. Morley. He was educated at the Nottingham grammar school and afterwards at the University of Oxford. He became a member of the Dissenting sect and subsequently was admitted to a seat in the upper house, in the counting-room of which Samuel Morley began his career at sixteen. On his father's retirement in 1840 he became practical head of the London concern, and when his brothers retired in 1855 sole owner. In 1860 he was sole owner also of the Nottingham business. Under excellent management the business grew rapidly into the largest of the kind in the world, with huge mills at Nottingham and in Leicestershire and Derbyshire employing thousands of hands. In 1865 Morley was elected M.P. for Nottingham, and from 1866-1885 he sat for one of the Bristol divisions. He was a strong Liberal and a whole-hearted supporter of Gladstone, who in 1885 offered him a peerage. He was one of the principal proprietors of the London Daily News, the chief Liberal organ of the period, and it was owing to him that its price was reduced from 3d. to 1d. and its losses turned to great gains. Morley was a deeply religious man. Like his father before him, he was a Dissenter, and for many years he strongly opposed every scheme of state interference with education. He was keenly interested in the temperance movement, and during the closing years of his life his public energies were chiefly confined to its promotion. His philanthropy was active, his charity widespread and munificent, and he was a model employer. He died on the 5th of September 1886. His son, Arnold Morley (b. 1840), was Liberal M.P. for Nottingham from 1886-1885 and for East Nottingham from 1885-1895. From 1886-1892 he was chief Liberal whip, and from 1892-1895 postmaster-general.

See Edwin Hodder, Life of Samuel Morley (1887); Frederic M. Byrd, [R. E. Morley: A Record of a Hundred Years (1915).]
a new name unto one of their Pavans, made long since by Master Thomas Morley, then Organist of Paules Church." This statement, however, lacks corroboration, and if Morley ever held the post he must have done so for a very short time. On the 5th of July 1588 he was admitted Mus. Bac. at Oxford. Four years later (July 24, 1592) he entered the Chapel Royal, where he successively filled the offices of epistle and gospel. From the dedication to his first book of canzonets it seems that in 1595 Morley was married. His wife's Christian name was Margaret, and before her marriage she apparently held some post in the household of Lady Periam, wife of the lord chief baron of the exchequer. On the 7th of September 1598 Morley received a licence for twenty-one years to print ruled music-paper and song-books in English, Latin, French or Italian. His rights under this grant were assigned by him to various publishers. In Burtong's Life of Gresham it is stated (i. 465) that the registers of St Helen's, Bishopsgate, show that Morley lived in that parish. This is inaccurate, and there is no proof that the family of the same name residing in St Helen's between 1594 and 1600 was related to the composer. In the preface to his Plaine and Easie Introduction to Practicall Musicke (1597), Morley gives as one of his reasons for undertaking that work that he led a solitary life, "being compelled to keep at home," presumably owing to ill health. On the 7th of October 1602 his place in the Chapel Royal was filled up, and on the 23rd of October 1603 administration of his goods was granted to his widow. This document (Add. Chart. 16234) describes him as "late parishioner of St Botolph's near Billingsgate," but the registers of that parish contain no entries relating to him. Morley was incontestably one of the greatest of the secular Elizabethan composers. His madrigals, canzonets and ballads are as remarkable for their beauty as they are for their admirable workmanship, and his Introduction to Practicall Musicke, in spite of its frequent obscurity, is an invaluable source of information as to the state of musical science in England at the end of the 16th century. His works are: (1) Canzonets to Three Voices (1593; 2nd ed., 1606; 3rd ed., 1631; Ger. trans.: Caxton, 1612, and Rostock, 1643); (2) Madrigals to Four Voices (1594; 2nd ed., 1600); (3) First Book of Ballads to Five Voices (1595; an Ital. ed. appeared in London in the same year; 2nd ed., 1606; Ger. ed., Nuremberg, 1606); (4) First Book of Canzonets to Two Voices (1595; 2nd ed., 1619); (5) Canzonets or Short Little Songs to Four Voices, selected out of Italian Authors (1597); (6) Canzonets to Five and Six Voices (1597); (7) A Plaine and Easie Introduction to Practicall Musicke (1597; 2nd ed., 1608; 3rd ed., 1771); (7) Madrigals to Five Voices, selected out of Italian Authors (1598); (8) The First Book of Consort Lessons, made by divers authors, ed. (1599; 2nd ed., 1611); (9) The First Book of Airs to Sing and Play to the Lute with the Base Viol (1600); (10) The Triumphs of Orian to Five and Six Voices, composed by divers several authors (1601). Besides the above, services, anthems, motets and virginal pieces by Morley are to be found in various collections, both printed and manuscript. (W. B. S.)

MORLEY, a municipal borough in the Morley parliamentary division of the West Riding of Yorkshire, England, 4 m. S.S.W. of Leeds, on the Great Northern and London & North-Western railways. Population (1891) 43,656. The town hall was opened in 1805; and a park, for which the ground was purchased from Lord Dartmouth, in 1890. The chief industries are connected with woolen cloth, machinery for the treatment of wool, coal and stone. The borough, incorporated in 1885, is under a mayor, 7 aldermen and 21 councillors. Area, 3385 acres. In the neighbourhood are ruins of a mansion, Howley Hall, dating from 1590, which, garrisoned for the parliament, sustained a heavy siege from the royalists during the Civil War. (W. B. S.)

MORMOR, or MORMER (from two Gaelic words mor, great, and mor, a steward or bailiff), a title used to designate the rulers of the seven provinces into which Celtic Scotland, i.e. the part of the country north of the Forth and the Clyde, was divided. These seven mormorships, or original "earldoms" of Scotland, as they were afterwards called, were: Angus, Athole with Cowry, Caithness with Sutherland, Fife, Mar with Buchan, Moray with Ross, and Strathern with Menteith.

MORMONS. The common name given to the Church of Jesus Christ of Latter-Day Saints, a religious sect founded by Joseph Smith, Jun., at Manchester, New York, in 1830, and since 1848 largely concentrated at Salt Lake City, Utah. Smith was born on the 23rd of December 1805 at Sharon, Windsor county, Vermont, from which place in 1815 or 1816 his parents, who like his grandparents were superstitious, neurotic, seers of visions, and believers in miraculous cures and in heavenly voices and direct revelation, removed to New York, where they settled on a small farm near Palmyra, Wayne county (then Ontario). In 1819 they removed to Manchester, in what is now Ontario county, about 6 m. from Palmyra. In Manchester Joseph, a good-natured, lazy boy, suffering from a bad heredity physically and psychically, began to have visions which seem to have accompanied epileptic seizures (his mother's father had two crystals), from which he recovered apparently before he became of age. The boy's father was a digger for hidden treasure and used a divining rod to find proper places to dig wells, and about this time the son became a crystal gazer and by the use of a "peep-stone" discovered the whereabouts of pretended hidden treasure. He said (in 1838) that on the night of the 21st of September 1823 the angel Moroni appeared to him three times, and told him that the Bible of the western continent, the supplement to the New Testament, was buried on a hill called Cumorah, now commonly known as "Mormon Hill." He seems almost certain that he told other and earlier stories of how he came to find the gold plates, and it is possible that before this time there was a story current in Canada of the recovery of a "Gold Bible." It was not until the 22nd of September 1827 that (as he said) he dug up, on the hill near Manchester, a stone box, in which was a volume, 6 in. thick, made of thin gold plates 8 in. by 7 in., and fastened together by three gold rings. The plates were covered with small writing in characters which, it was said, Professor Charles Anthon declared were in the "reformed Egyptian tongue"; with this "Book Smith" claims that he found a breastplate of gold and a pair of supernatural spectacles, consisting of two crystals set in a silver bow, and called "Urim and Thummim"; by aid of these the mystic characters could be read. Being himself unable to read or write fluently, Smith employed as amanuenses: first Martin Harris (1803-1875); then his own wife, Emma; after the middle of April 1829, Oliver Cowdery, a blacksmith and school teacher; and David Whitmer (1805-1888); to them, from behind a curtain, he dictated a translation, for the printing and publishing of which Martin Harris paid, in spite of the continued opposition of his wife to the scheme. An edition of 5000 copies of the Book of Mormon was printed at the office of the Wayne Sentinel at Palmyra. It was accompanied by "The Testimony of the Three Witnesses," a sworn statement of Oliver Cowdery, David Whitmer and Martin Harris that an angel of God had shown them the plates of which the book was a translation, and by "The Testimony of the Eight Witnesses," four of them Whitemers and three of them Smiths (Joseph's father and his brothers Hyrum and Samuel). Soon afterwards, according to Smith, the plates disappeared, being taken away by the angel Moroni.

The Book of Mormon, in which Joseph Smith was declared to be God's "prophet," with all power and entitled to all obedience, 1 Martin Harris took a copy in Smith's hand of certain "carac- tors" (so Smith spelled it) to Dr Anthon, who at first thought it a hoax upon the learned, but, after hearing the story of the diamond sceptacles and that Harris had been asked to pay for the publication of the book, said that it was a fraud on Harris. He recognized the miscellaneous and haphazard nature of the "carac- tors" of which facsimiles are given by Riley, p. 81, and Linn. Dr. Riley thinks that the "caracters" were automatic writing, and that "unconscious cerebration played a large part in the evolving of the great scheme." 2 More than a dozen years afterwards Smith, when asked if "Mormon" was not connected with the Greek word for "holgothlin" ("Mormo" is thus used in 17th-century English), explained that it meant "more good," from the Egyptian "moro," with the addition of more, or the contraction "mor."
proclaimed to give the history of America from its first settlement by a colony of "Jaredites" from among the crowd dispersed by the confusion of tongues at the Tower of Babel in the year 5 a.d. These settlers in course of time destroyed one another. In 600 B.C. Lehi, his wife, and four sons, with ten friends, all from Jerusalem, landed on the coast of Chile. Upon the death of Lehi, the divine appointment to the leadership of Nephi, the youngest son, roused the resentment of his elder brothers, who were in consequence condemned to have dark skins and to be an idle, mischievous race, the "Lamanites" or North-American Indians. Between the Nephiites and the bad Hebrews a fierce war was maintained for centuries, until, finally, in spite of divine intercession in the person of the risen Christ, who had presided at a Church with the same organization "as was enjoyed on the Eastern Continent," the Nephiites fell away from the true faith, and in 384 A.D. were nearly annihilated in a battle at the hill of Cumorah, in Ontario county, New York. Among the handful that escaped were Mormon and his son Moroni, the former of whom collected the sixteen books of records, kept by successive kings and priests, into one volume, which on his death was supplemented by his son with some personal reminiscences and by him burned after the death of his brother. Lehi, Moroni. Smith's this story is told with the book of primitive Indian chiefs are filled with the phraseology of the 19th-century camp-meeting: there are long extracts from the Westminster Confession, and a speech of Nephi contains a statement of doctrine which corresponds with heretical views held in Smith's own time in the presidency of Geneva, in which his home lay.

The time was singularly favourable to the founding of a new sect: religious unrest and receptiveness were prevalent; and western New York was the scene of the foundation of various new communities between 1789, when Jemina Wilkinson founded "Jerusalem" in Yates county, New York, and 1848, when the Far West gave their first spiritualistic manifestations about ten miles from Joseph Smith's home. His book and his claim to divine authority, upheld by frequent revelations, soon drew many followers to Smith. A Church was formally organized on the 6th of April 1830 at Fayette, Seneca county, New York; and in June a conference of about thirty members met at Fayette. Smith and Cowdery had previously (May, 1829) baptized each other, in alleged accordance with the instruction of John the Baptist, who had ordained them, conferring "the priesthood of Aaron"; while Peter, James and John afterwards made them priests of "the order of Melchisedec." In October 1830 Smith sent out Parley Parker Pratt (1807-1857), Oliver Cowdery, Ziba Peterson, and Peter Whitmer, jun., to test the truth of the first revelations for the later, friendly, LDS, in Ohio, was Sidney Rigdon (1793-1876), whom Pratt had formerly known, who had preached as a Baptist in 1819-1828—a part of this time in Pittsburgh—who had then joined Alexander Campbell and Walter Scott in establishing the Disciples of Christ, and who was pastor of a church in Mentor. Rigdon was baptized, became a Mormon leader, and, after a "revelation" of December 1830, made a new translation of the Bible, in which prophecies of the coming of Joseph Smith and the nature of the Book of Mormon are inserted in the 50th chapter of Genesis and the 29th chapter of Isaiah respectively. This translation was not published until 1866 and is not in use in the Mormon churches. In January 1831 Smith, who had been "persecuted" in his New York home, where several lawsuits, all unsuccessful, had been brought against him, accompanied Rigdon to Ohio, where at Kirtland (a few miles south-west of Mentor), Lake county, Ohio, the preaching of the new sect was very successful, partly because Pratt and Rigdon were so well known to the Disciples in northeastern Ohio. Smith at this time seems to have intended to make the New Jerusalem there he established a general store, a steam saw-mill and a book and clothing store, platted a great city, and built a stone temple, which was consecrated in 1836. But the church was "persecuted" again, especially by apostates; on the 25th of March 1832 Smith and Rigdon were tarred and feathered at Hiram, Portage county, where they were then living. In February 1834 the Church was fairly organized; already on the 8th of March 1833 Smith, Rigdon, and Frederick G. Williams had been styled the first presidency, and were entrusted with the keys of the last kingdom. About this time the licentiousness of Smith might have led to the dissolution of the Church but for Brigham Young (1801-1877), a Vermont painter and glazier, who was baptized in 1832 and soon afterwards was ordained elder. Young's indomitable will, persuasive eloquence, executive ability, shrewdness and zeal soon made their influence felt, and, when a further step was taken in 1835 towards the organization of a hierarchy by the institution of the quorum of the "twelve apostles," who were sent out as proselytizing missionaries among the "gentiles," Young was ordained one of the Twelve and despatched to preach throughout the eastern states. In 1836 the Kirtland Safety Society Bank was organized (in accordance with a "revelation" to Smith); as it was unchartered it issued notes under the name of "The Kirtland Safety Society anti-Bank-ing Co.;" but in March 1837 Rigdon and Smith, the secretary and treasurer, were charged with violating the state law against unchartered banks, and they were convicted in October; the society appealed, claiming that it was not a bank but an association, but in November the bank "suspended payments and in Jan. 1838 Smith and Rigdon left the state for Missouri. In 1836-1837 there had been a determined attempt to depose Smith and make David Whitmer head of the Church; Rigdon and Young successfully opposed this movement, which was backed by Whitmer, Pratt, Williams and Harris. Probably in June 1837 (or in July 1838) there was organized under the leadership of Captain "Fear Not" (David W. Patten) a band called "The Daughter of Zion" (see loc. cit. 13), the "Big Fan" (Jer. xv. 7), "Brothers of Gideon," and finally "Sons of Dan," or "Danites" (Gen. xxxix. 17), bound to secrecy under penalty of death, and formed to punish all who opposed the Church and its supreme head. Numerous crimes and outrages were attributed to them. In the winter

1 Rigdon had formerly been well known and respected in Hiram, which was a stronghold of the Disciples; there he had taught Latin and mathematics. The Rev. James A. Sanderson, deacon of the church, was deeply weighted with the matter of the Church. As Rigdon had been called to settle the matter, as this romance is so different in character from the story read by Spaulding to some of his friends in 1811-1812, that if it was really Spaulding's, it must have been a later work than The Manuscript Found, of the Book of Mormon. The discovery by Professor J. F. Fairchild, in 1884, in Honolulu of a manuscript romance by Spaulding (now in the library of Oberlin College, Ohio), which did not agree at all with the existing book, is now in the possession of the Rev. James A. Sanderson, deacon of the church, there. In his view Spaulding's story, his own additions to it must have been large, for parts of the book seem autobiographic, and one incident seems to be based on the anti-Masonic excitement prevalent in New York state after the disappearance of William Morgan in 1826—ten years after the death of Solomon Spaulding.

2 Young received at this time the title of "The Lion of the Lord"; Lyman Wright and Parley Pratt, who also became apostles, were called respectively "The Wild Ram of the Mountains" and "The Archer of Paradise.

3 The existence of this organization has been denied by Mormons, but there is abundant evidence that it did exist. See Linn, pp. 312-314, and Bancroft, p. 122-126; the latter, friendly to the Mormons, says (p. 124) that of the existence of the Danites "there is no question."
of 1830-1831 Pratt, Cowdery and two others had gone as far west as Jackson county, Missouri; in June 1831 Rigdon and Smith joined them there near what is now Independence and (in August) laid corner-stones of Zion and of a Mormon temple; thereafter Mormon immigration to Missouri increased rapidly and in the end part of 1838 Smith and Rigdon fled to the new settlement called Far West (now Kerr) in Caldwell county, Missouri, which had been made in 1836-1837. Thither many of the saints had taken refuge, having been forcibly driven from Independence and Big Blue in November and December 1833, and having been induced to remove from Clay county after staying there in 1833-1836. In Caldwell and Daviess counties Smith's troubles, however, continued to increase. His profligacy had repelled many of his leading supporters and bred internal dissensions, while from the outside the brethren were harassed and threatened by the steadily growing hostility of the native Missourians. At Far West on the 4th of July 1838 Rigdon preached his "salt sermon" from Matt. v. 13, urging his hearers to wage "a war of extermination" on those who disturbed them. To such a height did the conflicts with the "gentiles" grow that they assumed the proportions of a civil war, and necessitated the calling out of the state militia. A company of Danites from Far West put some Missourian militia to flight but lost their own leader Captain Patten; the gentiles then attacked a Mormon settlement at Hawn's Mill (near Far West) and killed in cold blood about a score of the Mormons. Late in October Far West surrendered to an overwhelming force of militia. Smith and Rigdon with others were arrested and imprisoned on a charge of treason, murder and felony, and their followers to the number of 15,000 crossed over into Illinois and settled near Commerce, Hancock county, Smith, who succeeded in escaping from custody, had rejoined the Mormons in Illinois, and there they were cordially welcomed, especially by the politicians of both parties, who hoped to secure the Mormon vote in the presidential campaign of 1840 and when they found (on the 4th of July, 1840) that the legislature of the state had adopted (Dec. 30, 1839) from the state legislature a charter which made the city practically independent of the state government and gave Smith nearly unlimited civil power. He organized a military body called the Nauvoo Legion (also incorporated by the legislature), of which he was commander, being commissioned "lieutenant-general" by the governor of Illinois in 1841; Smith allowed Dr. John C. Bennett, an Illinois politician and a new convert, to be the city's first mayor. Foundations of a new temple were laid on the 6th of April 1840, and the temple (83 by 125 ft.) was dedicated on the 1st of May 1846. The city was laid out rapidly; a university of the city of Nauvoo was established, among its professors being Rigdon and Orson Pratt (1811-1851), a mathematician, who was called "The Gauge of the Law." In 1842 Smith was charged with instigating an attempt, made by O.P. Rockwell, a Mormon of Nauvoo, to assassinate ex-Governor L. W. Boggs of Missouri; it was impossible to hold either Rockwell or Smith after their indictment and arrest, since the Nauvoo municipal court had the power to determine cases of habeas corpus; the influence of Dr. Bennett, who had quarrelled with Smith, was not strong enough to outweigh the power of the Mormon vote with the state authorities, and Smith was not held when in June 1843 he was arrested on the old charge of treasonable acts committed in Missouri. His downfall was brought about in a very different manner.

The Book of Mormon had forbidden polygamy: "There shall not any man have save it be one wife, and concubines he shall have none, for I the Lord God delighteth in the chastity of women. . . . For if I will, saith the Lord of Hosts, raise up seed unto me, will I not command my people, otherwise they shall hearken unto these things." The conditional clause may indicate that Smith from the first had intended to make polygamy a part of the creed of the Church. There is some evidence that even in Ohio polygamy had been secretly practised by Smith and less probably by other elders. In Illinois there seems to have been no secret about Smith's cohabiting with other women. On the 12th of July 1843 he had a revelation for the Nauvoo establishing a polygamy. This revelation was not published officially until 1852, but its purport immediately became known in Nauvoo and aroused great indignation. Dr. R. D. Foster, whose wife Smith seems to have coveted, and whom Smith had accused of theft and immorality, William Law and Wilson Law, wealthy Canadian converts, and Sylvester Emmons, a member of the council, established a newspaper the *Expositor*, which was to work for the repeal of the city charter, "to correct the abuse of the unit power, to advocate disobedience to political revelations," the editors being "as determined as anywheres for their office". For his part the revelation had evidently been a sequel to the accusation of treason and the marriage covenant, including plurality of wives, of Joseph Smith's methods and success in winning spiritual wives, and of the prophet's political ambitions. The city council tried the editors of the *Expositor*, the Smiths denying the "revelation" on plural marriage, and on the 10th of June the *Expositor* printing office was razed. Foster and the Laws fled to Carthage. There was a general uprising against the Mormons and Smith put Nauvoo under martial law; but his most able lieutenants were absent. The Council of Twelve, (with Joseph and Hyrum Smith and others were arrested on the charge of treason June 25, 1844) and were imprisoned at Carthage. On the night of the 27th a mob, with the collusion of the militia guard, broke into the prison and shot the two brothers dead. Rigdon, the survivor of the first presidency, and Brigham Young, who were absent from Illinois at the time of Smith's death, were rivals for Smith's place; Young succeeded in having the Council of Twelve, of which he was head, made the supreme authority, and then had Rigdon tried for threatening treason and treasonable attempt, and promptly found guilty and sentenced to death. Young had still to meet the opposition of Joseph Smith's family, who elected their own missionary, Joseph, the right of succession, and for a time supported the claims of James J. Strang (1813-1866) of Wisconsin, who had been hanged in February 1844, who told of revelations he had received, who settled with his followers on Beaver Island, Michigan, in 1847, was crowned "King of Zion" there in July 1850, and was killed by some of his followers there in June 1856, when his kingdom broke up. In January 1845 the Nauvoo city charter was repealed; hostility and suspicion against the Mormons increased; there were "burnings" of Mormon property in the surrounding country and righteous decrees against the pro-Mormon sheriff; a commission of four members (including Stephen A. Douglas), appointed by the governor, arranged with the Mormon authorities in October 1845 that they should all leave the state next spring. In May and June 1846 most of the Mormons left Nauvoo; in September the city was cannonaded and it again surrendered to the gentiles.

Five companies of Mormon volunteers joined the force under Colonel Stephen W. Kearny which marched to California in the winter of 1846-1847; but this was rather in the nature of assistance from the general government, which provided for their western transportation, than a proof of Mormon patriotism. An exploring party under Brigham Young entered (July 24, 1847) the Great Salt Lake valley and chose it as a place for their new city. Young then returned to Winter Quarters, near what is now Florence, Nebraska, and there on the 5th of December 1847 was chosen president as Smith's successor. Under his leadership, and in accordance with a scheme "revealed" to him and announced in January 1847, the march was organized in a

---

1 Brigham Young, Orson Pratt, and others of the Twelve were campaigning for Smith's candidacy for president of the United States, a campaign which he had undertaken because neither Henry Clay nor John C. Calhoun would give him satisfactory pledges as to the attitude he would take toward the Mormons if elected president.

2 Rigdon attempted, with brief success, to establish in Pittsburgh a Church of Christ, independent of the Latter Day Saints, but based on the same plan. He spent his last years at Friendship, Allegany county, New York.
masterly way; the main body, for instance, in its trip across the prairies made flour in a mill built by Young and reaped grain sowed months before by an advance guard. The first migration arrived in Salt Lake City in September, and the population of the new settlement before the close of 1845 was about 3000. The city did not prosper, however, during the first few years of its settlement; but in 1849 and 1850 it became a dépôt and outfitting place for the immigrants to California in the gold excitement. The free and easy immigration, the want of a systematic irrigation (here first used on a large scale in the United States) was another factor in the industrial growth of the settlement. As early as 1837 Mormon missionary work had begun in Great Britain, and many foreign converts had immigrated to Ohio, Missouri and Illinois; in December 1847, in a "general epistle" to the Church, Young urged all Mormons in Europe to emigrate as speedily as possible; 120 British saints immigrated in February 1848; a general "emigrating fund" was established in 1849, and the Perpetual Emigration Fund Company was incorporated in 1850; but in 1855 when there were 4425 emigrants, according to the British authorities, as a result of an attempt to cut down expenses, proper provision was not made for their transportation from Iowa City, only hand-carts or push-carts being supplied, and one-sixth of a party of 400 died of starvation or exhaustion in a winter march across the plains.

When the Mormons first went west they thought they would escape from the jurisdiction of the United States, but the treaty of Guadalupe Hidalgo at the close of the Mexican War transferred the region to the United States. In March 1847 the main force of the Mormons, under Brigham Young, moved across the Wasatch range to Salt Lake City, which was established in 1847-48. Brigham Young was the first governor of the Territory, and he had to struggle against great difficulties. The Mormons were divided into two parties. In 1849 the party associated with Young had about 6000 dans. The period of unrest and turmoil of the Mormon party and the non-Mormons was a period of great hardship and suffering. The non-Mormons were a mixture of几种 different groups, including some who were opposed to the Mormon religion and some who were simply interested in the gold rush.

In 1837 President Buchanan appointed Alfred Cumming (then superintendent of Indian affairs on the Upper Missouri) as governor of the Territory in place of Young, and sent 1500 men to Utah under Colonel Albert Sidney Johnston. On the 15th of September Young issued a proclamation forbidding all armed forces from entering the Territory, calling to arms all forces in the territory, and declaring martial law. On the 5th and 6th of October a band of mounted Mormons under Major Lot Smith captured and burned three supply-trains of the Federal troops; soon afterwards 800 men were cut out from another supply-train and were driven to Salt Lake City. The main body of the Federal troops under Colonel Johnston went into winter quarters in November at Black's Forks, near Fort Bridger. But in the spring of 1858, through the intervention of Thomas L. Kane of Pennsylvania, who had probably been baptized by Young in 1847 and seems to have been a Mormon agent in the East, and who now received letters of authority from President Buchanan, the Mormons were induced to make a merely formal submission to Federal authority. Governor Cumming acquiesced in this settlement of affairs, by which the actual victory was with the Saints. A peace commission sent to Utah in the summer of 1858 carried to the Mormons a presidential proclamation by which they received pardon for their treason. Practically all the Federal troops were withdrawn from Utah in the summer of 1860; soon afterwards Governor Cumming left the Territory to join the Confederate army. One of his immediate successors, John W. Dawson of Indiana, late in 1861 forced to leave the territory, having been terribly beaten by several Mormons who were without apparent cause and a woman. In 1862, because the Mormons were suspected of sympathizing with the Confederate States, Colonel P. E. Connor, in command of the military district of Utah (and Nevada), actually marched United States troops into Salt Lake City. Governor Stephen S. Harding, appointed in 1862, proved less tractable than previous governors; a mass meeting in March 1863 undertook to secure his removal; and in June he and a Federal judge were displaced, possibly by the influence of Young (who Harding had arrested for polygamy but who was not indicted), through capitalists and slavers and their friends. The Church became less hostile to the Federal government toward the close of the Civil War, as it became apparent that the Confederacy was to be defeated.

Young made a successful effort in 1863-1865 to assure the industrial and commercial control of Utah: after Colonel Connor established Camp Douglas in the immediate vicinity of Salt Lake
It became increasingly difficult for the Mormon authorities to prevent trade with genteel stores in the city; and in 1869 there was incorporated the Zion Co-operative Mercantile Institution, to which practically all retailers in the territory were forced to sell out. In 1860 the Pacific Railroad reached Salt Lake City and by lessening its isolation, lessened its control by Young. His power was shaken somewhat, and the general tone of Mormonism was improved greatly by the "Godbeite movement," led by W. S. Godbe and E. L. T. Harrison, who with T. B. H. Stenhouse, author of The Rocky Mountain Saints (1874), Edward W. Tullidge, who wrote an official History of Salt Lake City, and others, had established in 1868 the Utah Magazine, which attacked Young's despotism. Although Godbe and Harrison were "excommunicated" from the Church they were founded the Salt Lake Tribune (1870), the first permanent protest in Utah against Young. At the same time the power of the Latter-Day Saints and Young's autocracy were threatened by the growth of the Reorganized Church of Jesus Christ of Latter-Day Saints, which was formed in 1852 upon the announcement of the doctrine of polygamy, which declared that polygamy had been foisted upon the Church and that Brigham Young was an interloper, and which chose Joseph Smith III (son of Joseph Smith, jun.; born in 1852) as its head in 1856; in 1853 and in 1859 representatives of the Reorganized Church protested in Salt Lake City.

As early as 1862 Congress had passed the Morrill Act (introduced by Justin S. Morrill) "to punish and prevent the practice of polygamy in the Territories," but in 1867 the presiding officers of the Utah legislature, petitioning for the repeal of this act, declared that "the judiciary of this Territory has not, up to the present time, tried any case under said law." Attempts to pass some extreme measures in 1866 and in 1869-1870 failed. In October 1871 a grand jury in Utah indicted Young and others for violating a Territorial statute against improper cohabitation; but in April 1872 the Supreme Court of the United States (Chilton v. Englebrecht) practically declared the jury incompetent as it had been impanelled by a Federal (and not by a Territorial) marshal, and in October 1873 the same court (Snow v. The United States) ruled that the attorney-general appointed by the president in a territory could try no cases save those in which the Federal government was a party, thus putting the prosecution of polygamy cases into the hands of the locally elected attorney-general. But on the 23rd of June 1875 President Grant signed the Polignac Act, "in relation to courts and judicial officers in the Territory of Utah," which provided for prosecution by the United States attorney-general (not the locally elected official) in criminal cases in Federal courts in the Territory, for the impaneling of grand and petit juries by the United States marshal, and for the challenge of any juror practising or believing in polygamy on a trial for adultery or polygamy, and otherwise corrected the defects in the Territorial law as pointed out by the Supreme Court, so that prosecutions for polygamy might no longer be a mere farce. But the law was little more than a dead letter: there were few prosecutions, and the only conviction was that of Young's secretary, George Reynolds, whose case dragged on from 1874 to 1879. In 1873 Ann Eliza Young, called "Wife No. 19," brought a suit for divorce against Brigham Young; the defendant was at various times imprisoned and fined for failure to pay alimony pendente lite; and in 1877 the judge decided that the marriage was void as polygamous.

Young died in Salt Lake City on the 20th of August 1877; he left an estate of more than $2,000,000, and was survived by about 10,000 children. The Church owes much to him, for he was an able leader; he has been said of him that he was "for daring a Cromwell, for intrigue a Machiavelli, for executive force a Moses, and for utter absence of conscience a Bonaparte." It must be borne in mind that to him, more than to anyone else, the struggle of the Church against the United States. His only doctrinal contribution to the Church was in 1832 when, in a sermon, he said that our Father could be none other than the first man; that Adam came into the garden of Eden in a celestial body and with one of his wives; and that "He is our Father and our God, and the only God with whom we have to do."

Young's successor in the presidency—acting president until 1880—was John Taylor (1805-1887), an Englishman by birth, who was living at Toronto when P. P. Pratt converted him in 1836; he was a missionary in England in 1840; then went to Navarre, in Spain, and was one of the fourteen who went from there to France and Germany, and translated The Book of Mormon into French. His first counsellor, appointed in 1880, was George Q. Cannon, who was probably the real administrator. On the 22nd of March 1882 President Arthur approved the Edmunds Act, drafted by George F. Edmunds of Vermont, which disfranchised polygamists in the Territories, made ineligible for jury duty in prosecutions for bigamy, polygamy, or unlawful cohabitation all who practised polygamy or believed in it, and made polygamy punishable by a maximum fine of $500 and imprisonment of 12 months. As the act was opposed because it was ex post facto. Under the Edmunds Act and the Edmunds-Tucker Act of March 1887 about 1200 persons were convicted of polygamy or unlawful cohabitation in Utah, Idaho and Arizona. The law was so rigidly enforced that about 2,000 were disfranchised, and the president of the Church had to spend his last years in hiding, and many other prominent Mormons escaped on the underground. The Edmunds-Tucker Act of 1887 dissolved the Perpetual Emigration Company and the corporation of the Church of Jesus Christ of Latter-Day Saints; and the Supreme Court in May 1890, on the ground that the Church was an organized rebellion, upheld the constitutionality of the confiscation of the Church property. On the 24th of September 1890 Willford Woodruff (1807-1898), who had been chosen to succeed President Taylor in 1889, and who was himself a polygamist, issued a manifesto declaring "that my advice to Latter-Day Saints is to refrain from contracting any marriage forbidden by the law of the land," and that of the Church. President Grant signed the Edmunds Act, and the approved Woodruff's manifesto and accepted "his declaration concerning plural marriages as authoritative and binding." This apparent recantation of "revelation" was explained by Mormon scholars as Smith had explained the abdication of the New Jerusalem in Missouri—the Saints were prevented from carrying out the commands contained in a revelation, but as they had tried to obey, they would not be punished for disobedience. On the 4th of January 1893, in response to a petition from the officials of the Church pledging the membership thereof to faithful obedience to the laws against polygamy, etc., President Harrison issued a general pardon to all liable to the penalties of the Edmunds-Tucker Act, on condition that they had not violated its provisions since the 1st of November 1890 and should not violate them in future. On the 4th of January 1896 Utah was admitted to the Union as a state, one of the conditions made by Congress being that polygamy should be prohibited by the state constitution, and that this prohibition be repealable only with the consent of the United States and of the people of the state; and article iii. of the constitution reads: "The following ordinance shall be irrevocable without the consent of the United States and the people of this state: Perfect Woodruff was born in Connecticut, became a Mormon in 1832, in 1839 was made an apostle, in 1840 and in 1845 was a missionary to England, preached throughout the United States; wrote Letters from my Journey (1881), and was called in the Church "Willford the Faithful."

1 This act, introduced by Lake Potter Poland (1815-1887) of Vermont, was bitterly opposed by the Congressional delegate from Utah, George Q. Cannon (1827-1901), an Englishman by birth, a prominent Mormon missionary in Hawaii and Great Britain, and Prophet Young's successor as apostle. He had been elected in 1872, and there was a long fight to prevent his being seated because he was a polygamist.
toleration of religious sentiment is guaranteed. No inhabitant of this state shall ever be molested in person or property on account of his or her mode of religious worship; but polygamous or plural marriages are for ever prohibited.” In March 1836 the eschatized property of the Church still in possession of the United States government was restored, but the Church was not again incorporated, its legal business being transacted by its president as trustee-in-trust for the body of religious worshipers—between the Church of Jesus Christ of Latter-Day Saints; each ward of the Church has, however, been incorporated, and its bishop is its executive head. In 1858 President Woodruff died and was succeeded by Lorenzo Snow (1814–1901), a native of Ohio, converted to Mormonism in 1836. In 1838 Brigham Henry Roberts (b. 1837), an Englishman by birth and a Mormon leader, was elected to Congress from Utah; as he had three wives there was objection to his taking his seat in 1839 in the 56th Congress; and on the 25th of January 1900 by a vote of 268 to 56 he was excluded from his seat. In 1863 Reed Smoot (b. 1862), an apostle of the Church, was elected to the United States Senate, where there was an attempt to exclude him (not on the ground that he was a polygamist, for there was no suspicion of his having violated the law, but because the apostles of the Church still advocated polygamy); the Senate Committee on Privileges and Elections reported in favour of his exclusion; but on the 20th of February 1907 the Senate voted against his exclusion (42–28). According to Senator Smoot there were in 1906 not more than 500 householders in Utah who were polygamous, only six of the twelve apostles, and only one chosen since April 1900, were polygamous; and of the fourteen general authorities chosen between the 25th of May 1830 and 1850 twelve were monogamists, Joseph Fielding Smith (b. 1838), a nephew of the prophet, being a son of Hyrum Smith, succeeded to the presidency in 1901; he was a polygamist, and in March 1907, soon after the birth of what was said to be his forty-third child, he pleaded guilty when charged with breaking the law against polygamy and was fined $300.

The growth of the Latter-Day Saints has been largely in foreign countries. Missionary work in southern Canada was begun in 1833 by Orson Pratt, and in 1836 his brother, Parley P. Pratt, organized a mission in England; in 1837 the work was begun in Liverpool, which is still the headquarters in Great Britain; in Ireland the work met with little success; from Germany missionaries were expelled in 1831 and in 1833; the Book of Mormon was translated into Italian by Lorenzo Snow in 1832; a Hawaiian version was made in 1836 by George Q. Cannon; and the missions in Scandinavia were begun about 1850. In the earlier years of the Church all converts were urged to migrate to Utah, and the growing accounts of life there doubtless increased their number; the later policy of the Church is to concentrate as many as possible in Utah, and the Emigration Fund was dissolved and assisted immigration was forbidden by the Federal government, was for converts to remain in their native countries. In England (and to a lesser degree on the Continent) the announcement of the doctrine of plural marriage was a disadvantage to the Church, and many converts transferred their allegiance to the Josephites, or Reorganized Church of Jesus Christ of Latter-Day Saints, who always opposed polygamy and attempted to prove that such doctrines had been foisted on the Church by Brigham Young, who had supplanted Joseph Smith’s true successor, Joseph Smith, Jr.

In 1868 the total number of Latter-Day Saints in the United States (chiefly in Utah and the neighbouring states) was estimated at 350,000, and there were besides about 49,000 members of the Reorganized Church. In Utah there are four great Mormon settlements at Salt Lake City (1863), Mantle (1888), Logan (1884) and St George (1877). The Reorganized Church has twice been declared by United States Courts the legal successor of the Church founded by Joseph Smith, Jr.; and now all such” polygamy, human sacrifice, or killing men to save them, Adam being God, Utah being Zion or the gathering place of the saints, are doctrines of devils”; its headquarters are in Lamoni, Iowa, with branches in Des Moines, Nebraska, St Louis, Missouri (at Independence) or in Utah; in the resurrection of the body; in absolute liberty of private judgment in religious matters; and in the salvation of a man only if he believes in Christ’s atone-ment, repentance, is baptized (not by pouring water), receives the laying on of hands for the gift of the Holy Ghost by duly-authorized apostles. Among their minor rules as laid down in A New Testament for Latter-Day Saints (St Louis, 1873) are these recommendations: that it is not good to drink wine or strong drink, except at the Lord’s Supper (and even then it should be home-made grape-
MORMYR—MORYN

Very little is known of the habits of these fishes. Professor G. Fritsch, of Berlin, during his stay in Egypt for the purpose of experimenting on electric fishes, observed that they perish very rapidly when removed from the water, and he had the greatest difficulty in keeping some alive in an aquarium for two or three days. Captain S. Flower has recently been more successful, and the mormyrs have proved a great success in the Geizir aquarium, near Cairo, examples of the species having lived from ten to twenty-six days. The species with comparatively large mouths feed principally on fishes and crustaceans, the others on tiny animals and vegetable and more or less decomposed matter. P. Delhez, on the Congo, found that many are attracted to the river in the neighbourhood of human dwellings, where they feed on the refuse thrown into the water. It is probable that the species with a rostrum use it to procure small prey hidden between stones or buried in the mud, and that the flabby mental appendage with which they are provided is a tactile organ compensating the imperfection of the vision in the search for food. Until quite recently absolutely nothing was known of the breeding-habits and development. To the late J. S. Budgett we owe some very interesting observations made in the Gambia on Gymnarchus niloticus, which makes a nest, and the larvae of which are provided with filamentous gills.

Venerated by the ancient Egyptians, the mormyrs are often represented on hieroglyphics and mural paintings as well as in bronze models. The “Oxyrhynchus,” remarkable for its long, curved snout, is the most frequently depicted. A revision of the mormyrs has recently been made in the fifth volume of the Reiseberichte der Deutschen Gesellschaft für Afrikaforschung (1907), with a bibliographical index to the various anatomical and physiological contributions. The skull has been minutely studied by W. G. Ridewood, Journ. Linn. Soc. (Zool. xx., 1904, p. 188). Figures of the most remarkable forms will be found in Boulangier's Poissons nouveaux du Congo, Ann. Mus. Congo (Zool. i. and ii., 1898-1902), and in his Fishes of the Nile (London, 1907, 4th ed.). The breeding habits of mormyrs are described in Proc. Zool. Soc. (1907), xvi. 126.

MORAYN, PHILIPPE DE (1549-1633), seigneur du Plessis-Mary, usually known as Du-Plessis-Mornay or Du Plessis, French Protestant, was born at Buhy in Normandy on the 9th of November 1549. His mother had leanings toward Protestantism, but his father sought to counteract her influence by sending him to the Collège de Lisieux at Paris. On his father's death in 1559, however, the family formally adopted the reformed faith. Mornay studied law and jurisprudence at Heidelberg in 1565 and the following year Hebrew and German at Padua. On the outbreak of the second religious war in 1567, he joined the army of Condé, but a fall from his horse prevented his accepting the command of a regiment of horse. Mornay returned to France, and in 1568 a Huguenot apologist began in 1571 with the work Dissertation sur l'église visible, and as diplomatist in 1572 when he undertook a confidential mission for Admiral de Coligny to William the Silent, prince of Orange. He escaped the St Bartholomew massacre by the aid of a Catholic friend, and took refuge in England. Returning to France towards the end of 1573, he participated during the next two years with various success in the campaigns of Henry of Navarre. He was taken prisoner by the duke of Guise on the 10th of October 1575, but not being recognized was ransomed for a small sum. Shortly afterward he married Charlotte Arthablaste at Sedan. Mornay was gradually recognized as the right-hand man of the king of Navarre, whom he represented in England from 1577 to 1578 and again in 1580, and in the Low Countries 1581-1582. With the death of the duke of Alençon-Anjou in 1584, by which Henry of Navarre was brought within sight of the throne of France, the period of Mornay's greatest political activity began, and after the death of the prince of Condé in 1588 his influence became so great that he was popularly styled the Huguenot pope. He was present at the siege of Dieppe, fought at Ivry, and was at the siege of Rouen in 1589-1590, until sent on a mission to the court of Queen Elizabeth. He was bitterly disappointed by Henry IV.'s abjuration of Protestantism in 1593, and thenceforward gradually withdrew from the court and devoted himself to writing. He founded in 1593 the Protestant academy or
University at Saumur, which had a distinguished history until its suppression by Louis XIV. in 1688. In 1658 he published a work on which he had long been engaged, entitled *De L'institution, usage et doctrine du saint sacrement de l'eucharistie en l'eglise ancienne*, containing about 9000 citations from the scriptures, fathers and schoolmen. Jacques Davy Du Perron, bishop of Evreux, afterwards cardinal and archbishop of Sens, accused him of misquoting at least 500, and a public disputation was held at Fontainebleau on the 4th of May 1600.

Decision was awarded to Du Perron on nine points presented, when the disputation was interrupted by the illness of Mornay. His last year was saddened by the loss of his oldest son, and of his devoted wife in 1606, and were marked only by perfecting the Huguenot organization. He was chosen a deputy in 1618 to represent the French Protestants at the synod of Dort, and though prohibited from attending by Louis XIII., he contributed materially to its deliberations by written communications.

He was deprived of the governorship of Saumur at the time of the Huguenot insurrection in 1621, and died in retirement on his estate of La Forêt-sur-Sèvre on the 11th of November 1623.

His principal works, in addition to *De L'institution, usage et doctrine du saint sacrement de l'eucharistie en l'eglise ancienne* (La Rochelle, 1598), mentioned above, are *Excellents discours de la vie et de la mort* (London, 1577), a bridal present to Charlotte Arbalest; Traité de religion; ou l'Écriture principale guérie sur ce point en notre temps (London, 1575); Traité de la vérité de la religion chrétienne contre les athées, épicuriens, payens, juifs, mahométans et autres infidèles (Antwerp, 1581); *Le mystère de l'implantation de l'épiscopat* (Paris, 1586); *L'institution, l'Eglise, la Foi* (Antwerp, 1592); *Lettres de sens*, 3 vols. (London, 1737-1747); *Mémoires*, 17 vols., (Amsterdam, 1622-1625); *Correspondances*, 2 vols. (Amsterdam, 1672-1673).

There is a good article "Du Plessis-Morny" by T. Schott in Hauck's *Realencyclopaedie*, and another by Grube in *Kirchenzucht*.

**MORNING**, properly the dawn of day, sunrise, but extended to the whole early part of the day, from the dawn to midday.

"Morning" (M. Eng. *morgenwinter*) was formed on the analogy of "evening," from "morn," in M. Eng. *morgen*, and originally meant the coming of the sunrise, as "evening," the coming of the close of the day (O. Eng. *afwun*, from *afen*, *even*). The O. Eng. *morgen* represents the common Teutonic word for the dawn; the ultimate source has been assigned to the root, seen in "murk," "murry," meaning to be dark, or, with more probability, to the root *mergh*, to twinkle, shine (cf. Lith. mirgta, and further to the root *mar*, as in Gr. μαυράριον, to shine (cf. Lat. marmor, marble). The M. Eng. *morren* dropped the *n* and became *morn*, "morn," which properly means "morning," but was soon used of the day following the present.

The "morning-star" (Ger. *Morgenstern*) was a military weapon of the middle ages, consisting of a mace or club with a ball head studded with spikes; the spiked ball was sometimes swung loose from the head of the mace by a chain. The weapon was also known as a "holy water sprinkler." The "morning-girt," earlier "morrowe," Ger. *Morgengabe*, was the present given to a bride by her husband on the morning after the marriage. The custom is probably connected with the origin of the term "morningstar" (see *morningstar*).

**Morny, Charles Auguste Louis Joseph**, Duc de (1811-1865). French statesman, was the natural son of Hortense Beauharnais (wife of Louis Bonaparte, and queen of Holland) and Charles Joseph, comte de Flahaut (q.v.), and therefore half-brother of Napoleon III. He was born in Paris on the 21st of October 1811, and his birth was duly registered in a certificate which made him the legitimate son of Auguste Jean Hyacinthe Demorny, described as a landowner of St. Domingo. M. Demorny was in fact an officer in the Prussian army and a native of St. Domingo, though he owned no land there or elsewhere. After a brilliant school and college career he received a commission in the army, and next year entered the staff college and became lieutenant. The comte de Morny, as he was called by a polite fiction, served in Algeria in 1834-35 as aide-de-camp to General Camille Alphonse Trezel, whose life he saved under the walls of Constantine. When he returned to Paris in 1838 he secured a solid position in the business world by the establishment of a great beet-root-sugar industry at Clermont in Auvergne, and by writing a pamphlet *Sur la question des sures* in 1838. In 1842 he indulged other lucrative speculations he was helped by the beautiful and wealthy wife of the Belgian ambassador, Charles Joseph, comte Lehon, until there were few great commercial enterprises in Paris in which he had not an interest. Although he sat as deputy for Clermont-Ferrand from 1832 onwards he took at first no important part in party politics, but he was heard with respect on industrial and financial questions. He supported the government of Louis Philippe, because revolution threatened his commercial interests, but before the catastrophe of 1848, by which he was temporarily ruined, he meditated conversion to the legitimist cause represented by the comte de Chambord. His attitude was expressed by the motto with which he is said to have replied to a lady who asked what he would do if the Chamber were "swept out." "Range myself on the side of the broom handle," was his answer. Presently he was admitted to the intimate circle of Louis Napoleon, and he helped to engineer the coup d'état of the 2nd of December 1851 on the Morrow of which he received the ministry of the interior. After six months of office, during which he had shown commendable moderation and tact to his political opponents, he resigned his portfolio, ostensibly because he disapproved of the conflagration of the Orleans property but really because Napoleon, influenced by Morny’s rivals, resented his pretensions to a foremost place in the government and his desire to insist on his claims as a member of the Bonaparte family. He now resumed his financial speculations, and when in 1854 he became president of the Corps Législatif, a position which he filled with consummate dignity and tact for the rest of his life, he used his official rank to assist his schemes.

Politics and high finance with Morny went hand in hand. In 1856 he was sent as special envoy to the coronation of Alexander II. of Russia; he executed his mission with prodigal splendour, and brought home a wife, Princess Sophie Troubetzkoi, who by her connexions greatly strengthened his social position. In 1862 Morny, whose power was at its culminating point, was created a duke. It is said that he aspired to the throne of Mexico, and that the French expedition sent to place Maximilian on the throne was prompted by Napoleon’s desire to thwart this ambition. In any case, in spite of occasional dissensions, Morny’s influence with the emperor remained very great, and the liberal traditions which he had retained enabled him to serve the imperial cause by his influence with the leaders of the opposition, the most conspicuous of whom, Émile Ollivier, was detached from his colleagues by his efforts. But while he was laying the foundations of the "Liberal Empire" his health, undermined by a ceaseless round of political and financial business, of gaiety and dissipation, was giving way, and was further injured by indulgence in quack medicines. The emperor and the empress visited him just before his death in Paris on the 10th of March 1865.

Morny’s valuable collection of pictures was sold after his death. In spite of his undoubtedly gifted and social gifts Morny failed to secure the distinction he desired as a dramatist, and none of his pieces which appeared under the pseudonym of M. de St. Rémy—*Sur la grande route*; *Monsieur Choufleury restera chez lui*, and the *Finesses du mari* among others—met with any considerable success on the stage.

The figure of the duc de Morny is familiar to the general reader in the person of M. Morand, one of the heroes of Balzac’s *La Grande Destinée*, who had been one of his secretaries. See F. Loîse, *Le Duc de Morny et la société du second empire* (1906). Earlier accounts are by H. Castille, M. de Morny (1859), and Arthur de la Guérinière, *Études et portraits*
politique) (1856). See the literature dealing with Napoleon III., and the bust of the Emperor by Eckardt, also F. Lollée, Le Duc de Morny, adapted by B. O'Donnel. A volume, Extraits des mémoires de Morny: Une Ambassade en Russie 1856, was published in 1892.

MORO, ANTONIO (c. 1512-1575), otherwise known as Sir Anthony More, the eminent portrait-painter, was born in Utrecht in 1512 according to some, but in 1525 according to Keck, Kandern Mander in his Het Leven der Schilders. He studied his art under Jan Schoevel, and after making a professional visit to Italy he commenced to paint portraits in the style of Hans Holbein. His rise to eminence was rapid. In 1532 he was invited to Madrid by the emperor Charles V. to execute a likeness of Prince Philip. Two years afterwards he was in London painting the portrait of Queen Mary. For this picture an annual salary and, as some suppose, the honour of knighthood were conferred upon him. In 1537-38 he went to England with Mary, returned to Spain, and lived there for two years in great honour with Philip II., executing, in addition to portraits, several copies after Titian. His death took place at Antwerp about 1575.

Among his figure-pictures Van Mander specifies the "Circumcision of Christ," executed for Antwerp Cathedral, as one of the most notable. His portraits are full of individuality, and characterized by firm and solid rendering of flesh. Several admirable examples are preserved in Madrid; among the rest the portrait of Queen Mary of England, which has been excellently etched by Moreau (L'Art, 1857). The style and figure of his Dutch and Flemish Painters, "so much resembles that of Holbein as to frequently create a doubt to which of them a portrait is to be attributed, but he is not so clear and delicate in his colouring (perhaps from having painted so much in Spain) as that master."

MOROCCO (El Maghrib el Akka, "The Farthest West," i.e. of the Mahomedan world), an independent state of North Africa, bounded on the N. by the Mediterranean, on the E. by Algeria, on the S. (indefinitely) by the Sahara, and on the W. by the Atlantic as far north as Walidys or Walidis (c. 34° N. lat.), and on the E. by the Rif and the Sierras of the Mediterranean. It is the only country in Africa which has not been ceded, ceded, imposed, or occupied by foreign nations; and it is the only one on the western coast. It is provided with a fixed intermittent white light, visible for 30 m. The Atlantic Coast Line.—The Atlantic coast of Morocco is remarkable for its regularity; it has not a single gulf or noteworthy estuary; the capes are few and for the most part feebly marked. Southward from the Strait of Gibraltar the coast sinks within a few feet of the sea-level. In the low cliff which it forms about 43 m. from the lighthouse there is a great quarry, which from remote antiquity has yielded the hand-mills used in the Tangier district for grinding the grain, and for stretching the carpets. The Mediterranean coast—estuary—W. Muharwar and W. el-Kharrub agree with Sylcas's Gulf of Cotes (Tissol). Eight m. farther lies Azala, the ancient residence of the Emperor Justinian. It is the only port of the population of about 1200. For the next 16 m., between Azala and Laraish (Laraicha), the coast has a tolerably bold background of hills, Jebel Sarar forming an important landmark for the latter town, which, with its Phoenician, Roman, and medieval remains, is historically one of the most interesting places in Morocco. A line of reddish cliffs about 300 ft. high runs south for about 10 m. near the modern Beyt el-Mekouar. Near the little village of Lekhenne the coast sinks to where the shrine of Mullah Bū Sālāhān has an eminence 220 ft. high. Between Mullah Bū Sālāhān (often wrongly called "Old Māmorah") and a similar height crowned by the tomb of Bū Hārūd (Allah-ba'd), the land descends to the river Zarka, 10 or 12 m. long. Farther south, and separated from the sea by an unbroken line of rounded hills (250-260 ft.), is the much more extensive lagoon of Rūs el-Dūra, which in the dry season becomes a series of marshy meers, but in the rainy season fills up and discharges into the Schib. Eastward it is connected with the Marjat el-Gharb, led by the W. Meda. On the south side of the outlet of the Schib lies Mehediyah (otherwise misnamed New Māmorah or Mehduma) founded by 'Abdu el-Mūminī and named after the Muwattādī Mahdi. It was held by Spain from 1614 to 1681. Twenty miles farther is the mouth of the Bū Rughar, with Sallī (Sila) on the north side, hills of considerable extent and height, and the most fanatical places in the empire, and on the south side Rabbat, with its conspicuous Hassan tower, and Shella with its interesting ruins. Onward for 100 m. to Point Azammar and the mouth of the Umm Rūdā's river, the most unexplored on the coast for the most part low, and, with the exception of capes at Fedīla (a small village, originally a port, partly rebuilt by Mīdīh Iswāli, and containing a Mahometan sanre of the 16th century) and the coast between 1760 and 1773) and Dār el-Balā'id or Casblanca, it runs in a straight line west-south-west. Azammar (Berber for "The Wild Olives," viz. of the Sheikh Bū Sālah)—on the frontier town of the kingdom of Fez—stands on an eminence about 13 m. from the sea on the south side of the Um er-Rabī'a, here some 150 ft. wide, deep, and red, with an obstructing bar. The bay of Mazagan, a few miles to the south, curves westward with a bolder sweep and numerous capes and islands (stony and sand), with a range of hilly land less than 1 m. inland, lies the extensive ruins of Tīt, a town which proved a horn in the side of the Portuguese of Mazagan till they destroyed it. At Cape Blanco (so called from its white cliffs) the coast, which bulged out at Cape Mazagan, again bends south to resume much the same general direction for 55 m. to Cape Canton. On this stretch the only point of interest is the site of the vanished Warmi, a sacred temple of the Moors, which is supposed to have been destroyed in 1149 by an extensive lagoon, which by a little dredging would become the safest shipping station on the whole Morocco seaboard. About Cape Canton, the coast, having been formed of sand, runs up by a bold rocky headland, and the coast, with the high walls and square towers of its Portuguese fortifications shown to advantage by the ruggedness of the site. Sixty miles farther south lies Mogador, beyond which the coast is relatively narrow, running in almost a straight line, being known to navigators as the "Iron Coast." From Cape Sim (Ras Tagrirwāl), 10 m. south of Mogador, the direction is due south to Cape Ghir (Ighir Ufraini), the termination of Jebel Ifi (the leeward chain of the Atlas) forming the coast, being known to navigators as the "Iron Coast."
of the Spaniards, formerly known as the Gate of the Sudan. It is a little town with white battlecments three-quarters of a mile in circumference, on a steep eminence 600 ft. high. In the 16th century it was siezed by the Portuguese; but in 1536 it was captured by Mubah Ahmad, one of the founders of the Sa'di dynasty. Some 60 m. farther south, at the mouth of a river known by the same name, is the roadstead of Masa, with a mosque popularly reputed to be Jonah's restoration to terra firma. This port was regularly visited by the Genoese traders in the 16th century, who exported skins, gum, wax, gold and indigo. Another 50 m. farther south lies Hafi, a landing-place easily recognizable by the shrine of Sidi Worzek, a few miles to the south of which is the Cape Non of the Portuguese. The better known Cape Nûn lies 5 or 6 m. north of the W. Nûn, at the mouth of which is Assâka, a port which the sultan of Morocco opened to foreign trade in 1882, but closed after six months. From Assâka to the mouth of the Dra'a the country continues broken and fertile, but farther south it is flatter and more sandy, so that with the Dra'a the Sahara may be said to begin.

1 This must not be confounded with Santa Cruz de Mar Pequena, a post established in 1476 somewhere on this coast by Herren, lord of the Canary Islands. After obtaining permission to occupy the post in 1861, the Spanish government was unable to identify it, though in all probability the original site was the lagoon known as Puerto Canado, much farther south. But this is now too remote a spot to be worth colonizing, hence the desire to substitute some other. Hafi, on old maps Guider, was chosen (1878), there being some evidence to show that it was possibly the true site of the ancient fort.

2 See Valentin Ferdinand, Beschreibung West Afrikas (Mem. of the Acad. of Munich, 3rd Class, pt. viii.).

3 No, No, Nor, Naum, Nao, are among the various readings. It was another Cape Non to the south of Cape Bojador which seems to have given rise to the proverb, Quem passa o cabo de Nao ou tornara ou nao. See Bol. de la Soc. Geogr. (Madrid, 1880), p. 316.

Character of the Interior.—The backbone of the country is the Great Atlas (Dâren of the Berbers), for which see Atlas. The principal rivers take their rise in the Atlas Mountains, and the headwaters of the Mulwiya, the Sebû, the Um er-Rabi'a, the Dra'a and the Ziz all rise between 32° 20' and 32° 30' N., and between 3° 30' and 5° W. The Mulwiya (Mulucha and Malva of Pliny, &c.) is the river which the French have long wished to make the western boundary of Algeria. Its course is largely unexplored save by native French officials. About 34° 20' N. General Colville found it some 200 yds. wide but quite shallow; about 25 m. cast of its source, where it is crossed by the route to Ziz, it is already a powerful stream with a deep bed cut in the granite rock, and shortly afterwards it is joined by the W. Sgimmel, a still larger affluent (Robeifs). Of the lesser streams which flow into the Mediterranean it is enough to mention the W. Marti or Martin (otherwise W. Bût Siba, W. Râs, W. Mejeka), which falls into the Bay of Tetuan, and is identified with the Tamuda of Pliny and Thaluda of Ptolomy.

On the Atlantic seaboard there are a number of comparatively small streams north of the Sebû, the chief of which is the winding W. Lekkus, with several tributaries. The Sebû (the Subur magnificus et navigabilis of Pliny) may be compared to the Thames in length and width, though not in steadiness and depth of current. At Mesh'ra'at el-Kairi, about 70 m. from its mouth, it is about 10 ft. deep in the month of May and more than 400 ft. wide; and, though its banks are 21 ft. high, extensive inundations occur. The tide ascends as far as El-Kantura, 15 m. above Ma'mora, and steam barges with a small draught of water could make their way to the ford just mentioned, and
possibly even as far as Fez. Affluents of the Sebū are W. Mikkes and W. Redem (90 m. long). The swift and muddy current of W. Bélt usually loses itself in a swamp before it reaches the main stream. The Bou Ragrag, which debouches between Chefchaouen and Salaût, is about the same length as the Bélt, but of much more importance. It and the Um er-Rabî’a (mother of grass), although their mouths are widely separated, drain the northern slopes of the central Atlas. The impetuous Um er-Rabî’a, with a rocky bed and many rapids, is perhaps as large as the Sebū. W. el-Abiāûd, W. Akhdar and W. Tessaût are the principal affluents. This last is separated by about 10 m. only from the valley of the Tansift, the river which flows to the north of the city of Marrakesh; and by W. Nefis, the Asif el-Mâl (Asîf is Berber for river), W. Ubiû, and other smaller tributaries, receive the waters of theAnti-Atlas region.

The valley between the Atlas and the Anti-Atlas is traversed by the W. Sûs, whose ever-flowing stream is sufficient to turn the whole district into a garden. The Mâssa or W. al-Ghâs, though its headwaters drain only one or two of the lesser valleys at the south-west end of the Anti-Atlas, is “about 50 yds. from bank to bank at the mouth, with a depth at high water and in the proper channel of something over a fathom.” Further south is the Assâka, known to European geographers as the Wûn; and finally the W. Draût, which, as W. Draîet, reaches the sea in the extreme south of the Oued Ziz region. The Draût drains the whole north-western part of the Anti-Atlas region.

The generous streams from the south side of the main chain of the Atlas, the W. Dâdes from the east, and the Asîf Marghen, W. el-Molâh, or Warzazet from the west, flow through populous and fertile valleys, and uniting to form the Draîet’s cut their way southward through a gorge in the Jebel Soghâr, which, as the name implies, is a lower range running parallel to the Atlas proper. For the next 150 m. the stream holds a broad, S.S.E.-flowing alluvial channel, which, as it passes into this region, turns green, till at last its dwindling current bends westward to the sebkha (salt marsh) of Debûya. For a few weeks once a year the thaw-floods fill this shallow but extensive basin and rush onwards to the Atlantic; but in summer it dries up, and, like the bed of the river for some distance below, is covered with flourishing crops. From the mouth of the Atlas the Dâdes is farther east descend other streams, the W. Zîz (with its tributaries the W. Toudgha and W. Oheris), the W. Ghrîb, the W. Kénatsa, &c., which, after watering the oases of Medghâla, Todîf and Mänsûs, Kénatsa, &c., lose themselves in the sands of the Sahara.

The Atlas Mountains, which are built up of a series of ridges rising to 13,000 ft. to the east of Morocco, form the backbone of the country, and are the highest and most impressive of all the Atlas ranges, rising from crystalline limestones and schists of the Hercynian, Pre-Cambrian and possibly of Cambrian ages. They are much folded and broken through by numerous intrusions of basalts and dolerites. The mass of Jebel Tezah is composed of mica-schists and porphyry which appear to bear closer resemblances to the metamorphic rocks of Egypt than to the Hercynian crystalline formation of Central Africa. The strata of the central ridges are succeeded by a great thickness of purple marls, red sandstones, conglomerates and calcareous rocks, occurring in faulted, folded and detached areas and recently discovered to form a belt from Silurian to Trias. Later palaeozoic rocks of Devonian and Carboniferous ages are also found near the base of the range, and extend into the Sahara on the south-western and south-eastern flanks. The whole of the Cretaceous system is represented by the shales and limestones occurring between the coast and the edge of the plateau above Morocco, but do not enter into the composition of the High Atlas. Moraines, made up largely of unstratified blocks of porphyry, have been reported from the Upper Atlas. At the foot of the mountains, except the unaltered bed of the beds respecting the southern and the northern ranges, and were considered by Maw to belong to the Glacial Epoch. Between Damûna and the sea, however, the signs of a former glacia- tion seem uncertain and uncertain. No moraines occur here, and consequently the glacial origin of the boulder deposits is doubted by some who have been disputed. They are probably alluvial cones brought down from the High Atlas and mountainous regions. From Mogador to Iznas, the plains are studded with boulder deposits forming a hard crust, several feet thick, follows every undula- tion of the ground. Immense accumulations of tufa are met with in the limestone areas of the mountains. The chief tectonic structures which trend N. 20° E. belong to the Alpine and Mediterranean systems. The Cretaceous and Tertiary rocks are involved in these structures, which, however, were moulded on an earlier folding affecting the palaeozoic rocks of the Atlas region. The sunning of Africa from Europe at the Straits of Gibraltar took place in late Tertiary times, and the submergence of the Barbary coast is at a height of 50 to 70 ft. of Recent date.

Climate. — The climate is good, and produces a hardy people. Shielded by the Atlas from the hot winds of the Sahara, the coast of Morocco is more temperate than in the interior. The coast is free from very hot periods, and the cool winds, which blow from the sea, bring down the temperature during the hottest part of the year. The winter months, however, are very cold, and the inhabitants of the interior are more subject to complaints. Tangier is a recognized health resort, and Mogador and Rabat await development as such. Rain falls only between September and April, on the Atlantic coast it is brought by the south-west wind, and on the Mediterranean sometimes also by the east wind, or shârki, otherwise dry and somewhat trying to invalids.

The wonderful temperate climate of Mogador is due in a great measure to the trade winds, while in Tangier and Mogador the winter seldom rises over 50° F. or 10° C. Inland the extremes are much greater; and while on the plains or in low-lying cities the heat grows intense, snow gleans on the Atlas nearly every year.

The mountains have a mild winter climate, there being snow in the mountains almost the whole year round. The best months for visiting the interior are September (if rain has fallen), October, November and the early part of December, or May and June.

Fauza. — The absence of woodland keeps wild animals in check. Beavers, &c., which exist in many numbers near the towns. Several venomous snakes and two vipers are found, but are not common, and the same may be said of scorpions and tarantulas, but centipedes are common, and numerous. Lizards and tortoises are common and guarded against. Mosquitoes give little trouble save in towns or near water. Invasions of locusts are serious, but intermittent. Lizards, chameleons, tortoises and frogs are familiar objects; and it is from them that the title of the tortoise hawked about the streets of London are usually obtained.

Of domestic animals the mule is the great beast of burden, though camels, mares and donkeys are also employed. The horse is usually a stallion with some mule blood, but females are occasionally exported. The morocco (Equus caballus) is small and often leads a sedentary life. It is used seldom as a draught animal. Roughly broken young, whose mouth is soon spoiled by barbarous bits, and his feet by square shoes. The finest animals are said to be bred in Shîddhàma and Abûa. In form and size the mules are much superior and usually fetch two or three times the price of the horse. The horsemare is not unlike the Alderney, but being practically undetermined, and the color always varying, he furnishes a very different quality of milk, yielding it only while the calf looks on; the sheep, for the improvement of which, also, nothing is done, have spiral horns (not infrequently four), rounded foreheads and long, narrow, tapering ears, and the shorn wool of a good variety, but less care are still more abundant. Domestic fowls are kept in great numbers; they are of the Spanish type, small and prolific.

The bonito and mackerel fishery of the coast of Casablanca and Tangier attracts fishers from Spain, Portugal and other parts of Europe. Occasionally a small shoal may be found as far south as Mogador. Soles, turbot, bream, bass, conger eel and mullet are common, and the sea is also abundant in cod, haddock, herring, mackerel and capelin. Fish are caught by means of gill-nets, occasionally by shoals of a large fish called the asimach (scaena aquila), rough scaled and resembling a cod, and the asargatt (Temnodon solitare), the "blue fish" of North America, Crayfish, prawns, oysters, crabs and octopuses are also found. Various species have no proper method of catching them, and edible crabs seem unknown. The tunny, pilchard and sardine, and a kind of shad known as the "Barnaby salmon", are found in the rivers and estuaries of Morocco. The catching of the shad, a species of shad, mis-called "Barbary salmon" is a great industry on the principal rivers of the coast, and vast numbers of the fish, which are from 5 to 15 lb in weight are dried and salted. They ascend from the sea in spring. Barbels
and a few other small fish swarm in the streams, but for the angler there is little real sport.

The presence of a large proportion of plants of central and northern Europe (none of which can withstand the being of alpine or arctic type) and the absence of southern types characteristic of the sub-tropical zone, Ball concluded that "the Moorish flora" is due more to a transplanting of that great Mediterranean flora which, with local peculiarities, one finds from the Iberian peninsula to the Atlantic Islands," but that "the mountain flora of Morocco is a southern extension of the European temperate flora, with little or no admixture of evergreen trees, but so long as isolated from the neighbouring regions that a considerable number of new specific types have been developed." Of the individual plants none are more remarkable than those of the parâr and the argân. The former (Calitris quadrangularis, or Thuya articulata*) is a small tree that grows on the Atlas both in Morocco and Algeria. It furnishes gum sandarach; and its beautiful and enduring timber has been used by the Moors for doors and window shutters where the cypress was roofed, and with the citrus-wood, arbor vitae, of the ancient Romans. The argân, Elaeodendron argan (Argania sideroxylon), is confined to a tract of country extending about 150 m. along the coast, from the river Tnsfit almost to the river Sûs, and about 30 m. in breadth; and it is found nowhere else in the world. The fruit, which ripens between May and August, is an olive-looking nut, greedily eaten by camels, mules, sheep, and horned cattle (but not by horses) for the sake of the fleshy pericarp, and crushed by the natives to extract the oil from the kernel. Though "its strong and pungent savour" renders it nauseous to the European palate, it is in Europe largely used for soap and candles. The "prickly pear" and the aloe form part of the features of the landscape from the coast up to the slopes of the mountains, but near Rabat the cork tree has lost ground enormously though it probably forms the staple of the industry here. It extends for some 20 m. between the Bû Ragrag and the Sebû. The palm is particularly very abundant, but the most common wild plants are junipers or junipers. In the lowlands and valleys of the southern districts it is reduced to a mere scrub. Lentisks, arbutus, oaks, junipers, broom and wild thistles are also common. For oranges, Melograno, Marrakês for pomegranates, Fez for dates, Tizi-n-Tichka for almonds, Dukûlla for melons, Tagolalat, Edanâan and Rabât for grapes, and the sweet olives.

The grape is extensively cultivated, but principally for eating; the Jews manufacture crude but palatable wines. Sugar, once grown in Sebû, is now India. As a rule the date palms are introduced, or are wild, or are merely frutiferous. One of the most curious small trees, introduced from India, is the acacia (Acacia mearnsii). The ordinary vegetables are peas, beans, turnips, onions, garlic, capsciums, cucumbers, marrows and carrots. Sweet herbs are extensively grown for use in cooking and in the preparation of tea. In the mountains there is a large proportion of timber, enormous conifers, 10 to 12 ft. in girth of stem, oaks, &c., but the greater part of the country has been cleared of forest, exhibiting only bushwood, and in the upper Atlas the coniferous wood is almost entirely replaced by junipers, mahogany and pine.

In the country of the Beni Hassan squats are so abundant that the fibres of the bulbs are used instead of hair in making tent-cloth; and in the great valleys of the fountains the halls are covered for miles with a beautiful white heather. From such gorgeous combinations of colour one can well understand that the Moors drew the inspiration of their national art; but the season of floral splendour is brief, and under the sunny sky everything seems to be in the midst of straw.

Inhabitants.—No well-founded estimate exists as to the number of inhabitants within the Moorish Empire, and the suggestions vary between five and ten millions. The majority of the inhabitants are pastoral and agricultural in their pursuits; but while large stretches of country are inhabited sparsely or not at all, others, especially along the Atlas slopes, are closely dotted with considerable villages whose hardly contain a family. Arabs cultivate every foot of level surface which it is possible to till and irrigate. Three races inhabit Morocco, and the members of two of these are continually being introduced. The most numerous and important are the aboriginal Berbers (q.v.)—known locally also as Amazigh—who inhabit the mountainous districts, and whose blood to a greater or less extent permeates the Arabian population. These were the people who thrice conquered Spain—once from the Visigoths, and twice from their less stalwart co-religionists. It has been suggested that the settlement of Moors by this Berber element that has maintained the independence of Morocco alone among the countries of North Africa. The plains are for the most part occupied by Arabs (q.v.), introduced in the 12th and 13th centuries, after the so-called "Arab invasion" of the 7th century, which would have left few traces but for the Moslem missionaries who came after them. A large number of the plainsmen are, however, composite, "Arabized Berbers, known as "Moors" (q.v.), to which division also the missionaries belonged. Arabs are never found in the mountains save as religious teachers or authorities, but only a small proportion of them continue nomadic.

The third race which may be considered native is the Jewish, consisting of two distinct sections: those settled among the Berbers from time immemorial, speaking their language, and in addition a hideously corrupt Arabian; and those expelled from Europe within comparatively modern times, who have got little farther than the parts, where they speak Spanish with the Arabic.

These latter are the most progressive and flourishing of all the inhabitants of Morocco, and in their hands is much of the foreign trade. It is a remarkable fact that several of the so-called Berber tribes are believed to have been of Jewish origin, having embraced Islam on the coming of Mulai Idris. To these white races constant additions of a negro element are being added by the slave-trade with the western Sudan, while inter-marriages between negro and Arab or Berber have produced a proportion of mulattos.

The last class consists of the small colonies of Europeans settled at the ports, for the most part engaged in trade. The largest of these colonies, in this case principally Spanish, is found in Tangier. All such foreigners are under the local jurisdiction of their own consular courts. They possess moreover the right of claiming the protection of their authorities for natives entrusted with their interests, without which, in the absence of justice, commerce with the interior would be impossible.

Language.—The language of Morocco is Berber, of which several dialects are spoken, notably that of the Rif, towards Algeria, and the Shilha of central Morocco and the Sûs. Of these very little is known; but they do not essentially differ from one another or from those of Algeria, notwithstanding considerable variations of pronunciation which are due to the varying proportion of Arabic or other admixtures, there being no written standard to maintain. On the plains and coast of central Morocco, however, Arabic has superseded Berber, as the language of trade, and is the medium of all communication.

Since the 8th century, when Ibn Khaldun found the Arabic of Morocco very corrupt, it has made great strides, and having always been a foreign tongue with the Koran as its model, it has escaped many of the faults into which Eastern Arabic outside Arabia has fallen. This is especially noticeable in the correct Arabic value given to the alphabet and in the strictly classical use of many terms, especially among the literati of Fez, Marrakesh and Tétouan.

The divisions can hardly be said to exist in the Moorish Empire to-day, although they were at one time or other the independent kingdoms of Fez and Marrakesh, and the important provinces of Sûs, Tafelt and the southern districts. Racially, however, there is a close correspondence between the various subdivisions change according to the relative strength of tribesmen and government. Central Morocco, between the two spurs of the Atlas extending towards Rabat and at Cape Ghir, is, however, naturally parcelled out into a number of states, among which the two principal, Shâwiya, Dukûlla, Abda, Shâhidma and Hûbi, running from north to south along the coast, and Shragha and Rhâhima lying inland from the last three.
There are only three great inland cities, each of which in turn serves as a metropolis of sorts. Perhaps the most important of these is Marrakesh. It was founded by the Almohads in 1147, and has since become the capital of Morocco. The city is situated on an island in the sea, which is connected to the mainland by a causeway. It is one of the largest cities in the world, with a population of over 1 million.

The city is divided into two parts: the old city, or Medina, and the newer part, or Quartier Neuf. The Medina is the heart of Marrakesh, and is home to many of the city's most important buildings, including the Koutoubia Mosque, the Bahia Palace, and the El Badi Palace.

The Quartier Neuf is the more modern part of the city, and is home to many of the city's most important cultural institutions, including the Marrakesh Museum, the Casablanca International Center, and the Marrakesh-Casablanca Inter-University Center of Science and Technology.

Marrakesh is a city of great cultural and historical significance. It has been a center of trade and commerce for centuries, and has long been a gateway to the Sahara Desert. Today, it is a major tourist destination, with many visitors coming to explore its rich history and beautiful architecture.
with altogether by diabolical practices, many arising out of the long credit in vogue.

**Government.**—The Moorish government is a limited autocracy, the theoretically absolute power of the sultan being greatly circumscribed by the religious influences which in a measure support him, and by the official proletariat with which he is surrounded. The central government is known as the maghzen or makhzan (an Arabic word primarily meaning organization), a term also applied to the whole administrative body and collectively to the privileged tribes from whose ranks the sultans' officials are recruited. At the head of the administration are wazirs or ministers of state, who possess no power independent of the sultan's will. The wazirs in general accompany the court, but the minister for foreign affairs is stationed at Tangier. Local administration is directed by the governors of provinces and towns, who are nominated by the wazir al-dakhil (minister of the interior). The subordinate town officials are appointed by the governor, and sheiks direct the affairs of the villages. All appointments are practically without pay, office holders being expected to obtain remuneration from "presents," i.e. bribes and extortion. Attached to the government service are a number of tribes (called maghzen tribes), who furnish the sultan's body-guard, garrison certain towns, and perform other duties in return for exemption from taxation. There was no regular assessment for taxation, but such organized spoliation as might be required for public or private ends. That part of the sultan's revenue which is still most available is known as blad el-maghzen (government country); those regions where the sultan's authority is precarious are called blad ex-siba (the unsubsidiary service).

All the powers are represented in Tangier by diplomatic and consular officials, whose independent jurisdiction over their respective fellow-subjects leads to the frequent confusion of justice. The evidence of non-Mahomedans is not accepted in Moorish courts, where venality reigns, and unprotected Jews suffer constant injustice, besides daily indignities, for which they have no legal redress.

**Army.**—A half-organized army—service in which is partly hereditary, partly forced—is periodically employed in collecting taxes at sword-point, and in "eating up" the provinces; with it the custom is (or was) for the sultan to go forth to war each summer, spending the winter in one of his capitals. The only approach to a regular army consists of certain hereditary troops furnished by the maghzen tribes, the Bokhâr (black), the Udiâ (mulatto), the Ashragh and Arâfât of the Saâda of the Maghreb, and the Makhâznâ (mixed), all of whom are horsemen. The infantry (Askâria) are mostly rough levies; only a small portion being well trained and organized. They are formed generally into large companies, each consisting of the total available forces, and the arms are carried every pattern. There is no navy, but the government possesses several small steamers, one or two mounting guns.

Morocco. Although the Moors being among the strictest followers of Mahomet. The divisions of the East are unknown, and their tenants include the principal teachings of both Shias and Sunnis, but, as employing the Mâlekî ritual, they must be classed with the latter. Recognizing their own rule of Asâlâ el Mu'minin ("Commander of the Faithful") and Khâfîhât of God on earth, they acknowledge no other claimant to that position, and have few dealings with the Turks, whom they consider corrupt. They have not yet given way extensively to strong drink.

**Missions.**—The Franciscans for six and a half centuries did brave work in the country, since the foundress of their order offered herself for a devotion to the women belonging to their bodies by a body of skilled and Irish missionaries, suffered martyrdom; but they have long abandoned attempts to convert the Moors. The London Jewish Society was established in Mogador in 1875, and since 1884 various French, English, and American agencies support a considerable number of missionaries, men and women, including doctors and nurses.

**Education.**—The level of education could hardly be lower, although most males have an opportunity of learning to recite or read the Korân, if not to write. Only traders trouble about arithmetic. Youths who desire to pursue their studies attend colleges in Fez or elsewhere to acquire some knowledge of Mahomedan theology, logic, and mathematics from which a valuable series of Arabic theological, legal and historical works have been issued, but most noteworthy of all is the publication in Cairo in 1895 of an Arabic history of Morocco, in four volumes, by a native of Salli, Ahmad bin Khalid en-Nâsiî. A most practical step was taken by the French, on the conclusion of the agreement with Great Britain in 1904, in the establishment of a state-subventioned Mission scientifique au Maroc, which, in addition to establishing an office in Tangier, has subscribed a number of able students in research work, the results of which are collected in the periodical publications Archives marocaines (6 vols., 1904-1906) and Revue marocaine.

Other forward steps have been taken in the production of several important volumes on the country and in serious attempts to explore the Atlas. The vicomte de Foucauld attained the first place by his expeditions among the wandering tribes in the farthest regions and by his workman-like geographical records; Joseph Thomson did good work in the Great Atlas, though within a limited area; the vicomte de la Roche excavated some of the Roman remains; Mr Walter B. Harris made a bold journey through the Fez and Ifrîd; and the marquis de Sali and Louis Gentil added to the knowledge of the Atlas by interesting expeditions. A hydrographic mission under A. H. Dyâ also did valuable work (1905-1909). An equally important service was rendered by the compilation by Sir R. Lambert Playfair and Dr. Robert Brown of an invaluable Bibliography of Morocco to the end of 1893, containing over two thousand entries.

**History.**—The prehistoric antiquities of Morocco are of considerable interest. In the cave at Cape Spartel Tissot found regularly shaped arrow-heads, and in the north of the country he met with dolmens, barrows and cromlechs, just as in Algeria or Tunisia. The dolmens usually form a trapezium, and the body seems to have been buried with the knees drawn up to the chin. At Meknès, a quaint little village of widely-scattered houses built of rough blocks of yellow soft sandstone, about 8 or 10 m. south-east from Azâlâ, stands a group of megalithic monuments of some interest. They have been visited and described by many travellers, but Watson's account is the most detailed. Round the base of a mound (15 ft. high) of yellow sandstone lies a circle of sixty-seven large stones, one of which (at the west side) is more than 20 ft. high. In the vicinity are several other groups, some of still larger blocks. The Dogons' (see Africa, Roman) seem to have run from Tangier southwards to the coast of Timgad (Miknâs) and from Azâlâ to the south of Raḥât; and Roman wall and various small original remains marked by considerable remains of masonry. At Ksar Fârâ'ôn (Pharaoh's Castle), on the western slope of J. Zarhûn, are the ruins of Volubilis. The enceinte, constructed of large stones and flanked by round towers, is 12,000 ft. in extent. Four gates are still recognizable, and a triumphal arch erected in A.D. 216 in honour of Caracalla and Julia Domna. The stones of this site have been used for Mequinez Mâkins. The Roman site of Sâhâla (formerly Valenita) is identified with the ruins of Sidi Ali Ben Nasser, Thintâr and Mohammed, with those of Sidi Ali ben Hamed. At Shamshim, up the river from Larisah, the city of Lixus (Trîx of Strabo) has splendid specimens of the Roman and Roman stonework, and the similar remains on the headland of Mâlûl Bâ Selham probably belong to the Mudelecha of Polybios. Of early Moorish architecture good examples are comparatively few and badly preserved. Besides those in Fâs, Mâkins, and Marrâkesh, it is sufficient to mention the mausoleum of the Beni-Marrin (11th to 16th centuries) at Shellia, which, with the adjoining mosque, is roofless and ruined, but possesses a number of funeral inscriptions.

The earliest records touching on Morocco are those of Hannio's Perîplus, which mentions that Carthaginian colonies were planted along the coast. The savage and inhospitable tribes with whom they came in contact included cave-dwellers; but megalithic remains point to a yet earlier race. It is not till the last century p.c. that Moroccan Berbers are found supplying troops to Pompey or Sertorius, and later, under Augustus, becoming themselves incorporated in the Roman province of Mauretania. The British Roman province reached only to the Bâ Ragrâg, on which Sala, now Salli, was its outpost; Volubilis, near Mequinez, being its principal, if not its only, inland city. In the fifth century a.D. the country became subject to the Vandals and, about 618, to the Goths.

1 Gentil, in La Géographie, No. 3 (1906), describes the Siurau region, which, N.W. of Tikirt, connects the Anti Atlas and the High Atlas. The Siurau volcano compares with the finest volcanoes of Europe.
The coming of the Arabs under 'Oqba ('Okba) in 682 was of far greater moment, though it was not till twenty years later that his successor, Mūsā ibn Nūsair, undertook a successful expedition as far as Taffālīt and the Drīs. The force of ten thousand Arabs and Egyptians with whom Tarīq (Tārik) ibn Zāhīd held the Tangier district in 710 was trebled by the enrolment of the Berbers, who enabled him next year to invade Spain, burning his boats behind him (see CALIPHAITE, § C. Abbasids). But the Moroc-

Spanish Berbers chafed beneath the Arab rule, and in 739 successfully revolted, setting up their first independent ruler, Mārisā. Their kinsmen in Spain followed suit with equal success, and though subdued for a time, they retained their independence in certain parts till the 12th century, when, as masters of Granada, they subjugated their implacable foes, the Arabs; and finally, under the Murābītī and Muwāhḥādī dynasties, conquered all Mahommedan Spain.

The recorded history of the Moorish Empire commences with the settlement near the Roman ruins of Volubilīs in a.D. 788 of Idrīs the elder (Idrīs b. Allahīyā), one of the fugitive descendents of Mahomet during the struggles between rival claimants of the caliphate. Iblīsīm had then been established in these parts for eighty years, but Idrīs and his son, Idrīs II., the builder of Fez, extended its influence, uniting the Berbers into a kingdom. Their line controlled a limited portion of northern Morocco for nearly two centuries, in part supplanted by the Mīkǎsā in 922, until displaced by the Maghārāwā in 988. These two dynasties were exterminated in 1061 by Yūsuf I. (bin Tashīfīn), founder of the Murābītī dynasty of Berbers (Almorāvides), who added the remainder of Morocco, most of Spain and Portugal, and Iblīsīm. Their principal existing monument is the city of Marrākēsh. In 1149 the Murābītī power was overthrown by another religious leader, 'Abd al Munmūn at the head of the Muwāhḥādī—i.e. "Unitarian"—hoarde (Adīrīyīn), under whose successors the Moorish Empire reached its zenith at the close of the 12th century. It then included, in addition to the Murābītī realm, what now are Algeria, Tunisia and Tripoli, extending to the frontier of Egypt, which they were prevented from occupying by the rise of Saladin. Before the middle of the 13th century they had been driven out of Spain, and had lost all but what is now known as Morocco, whence, between 1217 and 1256, they were ousted by the Beni Mārin (Marīñides). To them we owe the Girālda, Hasān and Kūtubīya towers of Seville, Rabat and Marrākēsh respectively, the Alcēxar or tower of Fez, the Alcēxar and the Defend, and the parts of Rabat and Al Ḫāṣar. It was under their rule that Francs of Assīsī despatched to Morocco the first Christian missionaries of modern times. (See ALMORĀVIDES and ALMOHADES.)

The new dynasty differed from the two which had preceded it in being frankly part of a Berber tribe, the Zenātā, who carved out a kingdom for themselves. Having assisted the Murābītīs and Muwāhḥādīs respectively at the battles of El Arcos (1109) and Las Navas (1212), the defection of their amirs on that occasion offered an opportunity for Abd-el-Ḥakē, the son of their general, to attempt the overthrow of the reigning house. At first the Benī Mārin professed allegiance to Tunis, where the Ḥāṣās, a branch of the Muwāhḥādīs, had thrown off the Moorish yoke and secured acknowledgement in northern Morocco and parts of Spain. But they were soon in a position to proclaim complete independence, and by the time that Abu Bakr, the third son of Abd-el-Ḥakē to succeed him, died, in 1258, they held sway over all that is now known as Morocco, and in 1260 saw the death of the last Muwāhḥādī prince.

Abu Bakr the Third (Abu Bakr the Successful Yākūb II., one of the few amirs of Morocco who have left a name for just administration and for philanthropic undertakings. Although of strict religious habits, he displayed no bigotry, studying philosophy, and entering into friendly intercourse with Europeans, whom he encouraged to trade with Salli. In 1267, 1275 and 1277-79, he undertook successful expeditions to Spain, and again in 1284, this time, in alliance with Alphonso of Leon, against his rebel son Sancho. But Alphonso dying during the struggle, Yākūb found himself master of his country, and Sancho had to acknowledge his suzerainty. All Mahommedans within his domain were freed from all taxes, and all the Arab manuscripts of the country—thirteen loads—were despatched to the college Yākūb had built in Fez. But Yākūb did not live to reap the benefits of his conquest, which were enjoyed by his son, Yūsuf I. (1286), who was courted by his father's old foes, entering into amicable relations with Tunis, Egypt, Arabia, and the neighbouring European states. With the contemporaneous Benī Zeyān dynasty of Temẹn, sworn foes of his house, however, he was still at war when stabbed (1297) in the new town of Temẹn, which he had built while conducting the battle of the old. The second siege was begun in 1335, and Temẹn fell in 1337 to the fourth of the dynasty, Alī V., Abu l-I Ḥasan, better known as "The Black Sultan." Unsuccessful in his invasion of Spain and Tunis, Alī had eventually to abdicate in 1351 in favour of his rebel son, the famous "Abu Aīnān," Fāris I., who during a short reign recovered Algeria and Tunis. The Beni Marīn were soon driven back, till a few years later Temẹn alone remained to them, and this they held only till 1359 (see TEMẸN). Thereafter their empire became habitually shaken by internal struggles. At length, in 1415, the Portuguese began to obtain footholds on the coast, Ceuta being lost to them in 1415, Al Kasaar in 1458, and Azālā and Tangier in 1471. On the failure of the Beni Marīn the amirate was seized by Sa'id III., "El Waṭṭās," head of another branch, founder of the short-lived Waṭṭāsī dynasty. His reign is memorable as that in which the "Catholic Princes" expelled his co-religionists from Spain, the last amir of Granāda and many others taking refuge in Morocco, where in 1492 they built for themselves Tetuān. His son, Mahomet VIII., surnamed "the Portuguese," because so long had he been held prisoner of the old, left to Portugal practically all his Atlantic ports but Salli-Rabat, and of Peñon de Velez to Spain, which had a few years previously captured Melilla. Although two more reigns carried the dynasty down to 1529, it has barely left its mark upon the country. From the beginning of the new century a rising power had been making itself felt in the south, over which the Waṭṭāsīs never held sway.

The family of sharīfs or "nobles"—that is, descendants of Mahomet—popularly known as the Sa'ādi or Ḥasanī (Hosainī), the first and last of the three great Muslim dynasties, the Sa'ādi (1554-1668). Their opportunity religious leadership rallied the disjoined members of the empire for a jehād against the Portuguese, but ultimately, on the death of Mahomet VIII., when in possession of the kingdom of Marrakēsh, the sharīfs defeated his successor and arranged a formal division of the country at the Um er-Rabī'a. At the head of the movement were then the two sons of the sharīf who had started it, Ahmed III. and Mahomet IX., between whom rivalry broke out, resulting in the success of the latter, who by 1550 found himself the master of the whole empire on carrying off the last Waṭṭāsī amir Mahomet and espousing his daughter. On the assassination of Mahomet IX. in 1557, the succession passed by a previous agreement to his brother's son, 'Abd-Allāh IV., who secured himself against the possible rivalry of his brothers by putting ten of the twelve to death. One of the survivors, however, 'Abd-el-Mālek I., deposed 'Abd-Allāh's son, Mahomet XI., whose appeal to Sebastian of Portugal for assistance, brought about the celebrated "battle of the three kings," in which they all perished in 1578 near Al Kasaar. This opened the way to the most famous of all the Sa'ādi, 'Abd-al-Ḥādēbī, the "Golden Lion," who proclaimed himself caliph, the last (nominal) Abbasīd holder of that office having been superseded by the Turks on their conquest of Egypt in 1537. He entered into friendly relations with Queen Elizabeth and other European potentates, and the oases of Ţuṭt, &c., were added to his dominions, which embraced also Timbuktu, whence came gold and tobacco. Ahmed fell a victim of the plague in 1603, and the
succession was disputed by three of his sons. In 1608 one of them, Zidán, became supreme and reigned twenty years. To subdue rebellions Zidán twice obtained the assistance of English troops from Charles I., and, like his father, employed large numbers of European artificers in the various palaces he built or completed. The two sons who succeeded him had both become drunkards from intercourse with these foreigners, but a third, Mahomet XIII., called from prison to reign in 1636, proved himself a wise and beneficent ruler. But his friendship for Europeans displeased the more fanatical among his subjects, and after a futile attempt on the part of a central Moorish "saint," of great reputation to oust him, and the "Christians" on the coast as well, another family of sharifs was invited from Taiflåt to undertake the task, and by 1649 they were masters of Fez.

Before tracing the history of the Filâlî dynasty, which still holds its own, it will be convenient to refer briefly to the relations which subsisted then (17th century) and for many years afterwards, apart from wars with Spain and Portugal, between the Moors and Europeans. From the early part of the 13th century there are records of Christian mercenaries and others in the Moorish service, while intermittent trading expeditions had already brought the principal European ports of the Mediterranean into touch with Morocco. The settlement of European traders in Moorish ports does not appear to have commenced till later; but it soon became an important factor, for the Moors have always appreciated the advantages of foreign commerce, and thus the way was opened up for diplomatic intercourse and treaty privileges. Even while their rovers were scouring the sea and making slaves of the foreigners captured, foreign merchants were encouraged to trade among them under guarantees and safe-conducts. Thus originated all the rights enjoyed by foreigners in Morocco to-day, as subsequently confirmed by treaties. France was the first to appoint a consul to Morocco, in 1577, Great Britain only doing so a century later. For centuries the treatment of foreign envoys in Morocco was most humiliating, the presents they brought being regarded in the light of tribute. It was not till the year 1900 that the custom was abolished of mounted sultans under umbrellas receiving ambassadors on foot and bareheaded.

While, from the European point of view, the pirates of the Barbary coast were a bloodthirsty set of robbers, in no way to be distinguished from the sweepings of Western civilization who scour the seas farther east, from the standpoint of the Moors they were the pious religious warriors for the faith, who had volunteered to punish the Nazarénes for rejecting Mahomet, and it is difficult to realize the honour in which their memory is held save by comparison with that of the Crusaders, in which the positions were exactly reversed. The Moorish rovers approached as nearly to an organized navy as anything the country ever possessed, and at times they were fitted out by the state, to whom their prizes therefore belonged. They made descents on the opposite coasts, even as far as Devon and Cornwall, carrying off the population of whole hamlets.

Sâli, Ma’mora (Medéïna), Larâis, Tangier, Cëuta, Tetuan, and Bâdès were their principal rendezvous in Morocco, and their vessels, an assortment of almost every known build and rig of the day, varied greatly in numbers and size. It is probable, however, that contemporary writers greatly over-estimated their importance. They appear to have flourished chiefly throughout the 16th, 17th and 18th centuries, and to have attained the zenith of their power during the latter part of the 17th century. A great impetus was given to their raids by the expulsion of the Moors from Spain in 1610, and their operations were facilitated later by the recovery of most of the Moorish ports from foreign hands. The varying influence of the different European states could be gauged at first by the prices they were compelled to pay to ransom their captive subjects, and later by the annual tribute which they were willing to present to protect their vessels. Some countries continued the payment well into the 19th century, although the slavery of Christians in Morocco had been abolished by treaty in 1814.

During the time that piracy flourished hundreds of thousands of foreigners suffered captivity, torture and death in Morocco rather than abjure their faith, the one condition on which a measure of freedom within Morocco was offered to them. The horrors of that time were keenly felt in Christendom, and collections were constantly made at church doors for the ransom of Moorish captives. Frequent expeditions for that purpose were undertaken by the members of religious brotherhoods, not a few of whom themselves became martyrs. The lot of the European slave was infinitely worse than that of the negro who indifferently embraced Islam, and was at once admitted to equality in all points save freedom. They were principally employed on public works or in galleys under the task-master's lash, both men and women being subjected to every indignity.

The record of the Filâlî dynasty may now be considered. The first of this line proclaimed in Fez was Mahomet XIV., but the first of European fame was his brother, Rashid II., "The Great Taflâtta," as he was styled by the English, who then occupied Tangier, sultan from 1664 to 1672. With him opened a terrible epoch of bloodshed and cruelty, only once revoked since—during the short reign of El Yâžîd (1700-1702)—the horrors of which for both natives and Europeans, are often indescribable. It reached its climax under his brother Isma'îl. A man of wonderful vitality, his reign lasted 33 years (1672-1727), during which his fierce grasp never relaxed. Many hundreds of sons and countless daughters were born to him in a harem rivalling that of Solomon, for which he even asked a daughter of Louis XIV. Having, as he supposed, driven the English from Tangier, he laid an unsuccessful siege to Ceuta for 26 years, but otherwise his military measures were confined to subduing internal enemies, in which he was supported by his faithful black troops, the Bokhâris, and also by a foreign legion of renegades.

For 30 years after Isma'îl's death one son after another was set up by the Bokhâris, seven succeeding—some of them more than once—till one, Abd-Allah V., who partook of his father's bloodthirsty nature, ended his sixty turn of power in 1757. Then, at last, this dynasty provided a beneficent sovereign in the person of his son, Mahomet XVI., during whose reign of 33 years the land prospered. By him Mogador was built and Mazagan, the last hold of the Portuguese, recovered. He was followed by the wretch Yâžîd, his son by an English or Irish woman, whose reign was fortunately cut short while contending with four rival brothers, two of whom in turn succeeded him, the second, Sulaimân II., proving as wise a ruler as his father. Under his reign (1795-1822) piracy was abolished, but the policy, maintained till the end of the century, of having as little as possible to do with foreigners was initiated.

By Sulaimân's direction the imperial umbrella passed to his nephew, Abd-er-Rahmân II., on whom he could rely to maintain his policy. Although disposed to promote foreign trade, he made a futile attempt in 1828 to revive piracy, which the Austrians frustrated by reprisals next year. Following this was the war of 1830 with France over the partition of Algeria, as a result of which the Moors renounced all claim to Tlemcen and entered into agreements the infraction of which led to a second war between the two in 1844, during which Tangier and Mogador were bombarded. A bombardment of Sâli in 1851 secured for the French the settlement of various claims, and when Abd-er-Rahman died, in 1859, the Spaniards were threatening Tetuan.

War being declared, the Spaniards marched on the town, which they captured after two months, and held till peace was signed six months later on their own terms. The vanquished sultan, Mahomet XVI., reigned till his death in 1873, when his son, El Hasan III., succeeded, having the usual fight to secure the supremacy. In comparison with his predecessors El Hasan was mild and gentle, too much so to maintain continual
peace among the more turbulent of his subjects. From early in the century Sâs had practically maintained independence, but in 1882, was reduced to submission, as also were subsequently the other great Berber centres, one by one, till the land had rest. Fighting between the Rifians and Spaniards of that having involved the sultan in some payment of a sum of 500,000 francs, he was on his way to recover this from the clerics when he died in camp and was interred at Rabat.

El-Hassan's death was kept secret till the coffin reached its destination, so that a peaceful proclamation was secured for ' Abd-el-'Aziz IV., his son by a Circassian slave who possessed great influence over him. His trusted chamberlain, Si Ahmed ben Mûsa, became Wazir regent, and put down all opposition, ruling with a firm, wise hand till 1900, when he died just as his ward attained his majority. During his rule new cities sprang up, and a new set of ministers came into power. The young sultan now showed himself desirous of acquiring and practising foreign arts and of introducing foreign reforms. Under his mother's advice he sought especially the friendship and advice of Great Britain, on whose disinterested friendship he believed he could rely. But lack of training and experience frustrated his praiseworthy efforts, and he became the prey of schemers and speculators, who pandered to his worst traits and squandered his treasure.

This turn of affairs aroused the fanaticism of his people, and in 1903, the Barbers of the Algerian tribes, who had been in rebellion under Jelâli Zarhûni, nicknamed "Ba Hamâra," who claimed to be fighting on behalf of the sultan's brother Mahomet, already imprisoned in Mequinez for revolt. Unable to subdue the rebellion, which did not, however, affect the rest of the empire, ' Abd-el-'Aziz borrowed money from France to reorganize his army, but failed to effect his purpose. Meanwhile a local sharp, Mulai Ahmed er-Raisûli, made himself master of the district round Tangier, holding even foreigners to ransom, and creating a false impression abroad as to his government.

The end appeared near when by a declaration, signed in London on the 8th of April, 1904, Great Britain, in return for concessions in Egypt, agreed to interfere with French action in Morocco. In this declaration, one of the series of arrangements marking the establishment of the entente cordiale, France declared that she had no intention of changing the political status of Morocco. She designed, however, a system of "pacific penetration," and administrative, economic, financial and military reforms—reforms which the Moorish court did not desire. By a separate convention with Spain in October 1904, the French protectorate in Morocco was safeguarded, and it seemed that the Anglo-French agreement had the approval of all the powers. Some weeks before its conclusion its terms had been communicated to Germany, and four days after its signature Count Bülow had stated in the Reichstag that there was no ground to apprehend that German interests ("essentially economic") in Morocco would be disregarded. During the remaining months of 1904, however, and in the opening months of 1905, the international situation was changed. Germany had viewed with concern the increased influence of France in Europe, but remained quiescent until after the reversal of the Russian army in Manchuria, when it was judged in Berlin that the time had arrived for Germany to become the arbiter of European policy; and the means to demonstrate her position were found in the Moroccan question. After having turned a deaf ear to the demands of the Pan-Germanic party for the "vindication" of German rights in Morocco, after in fact nearly a year of acquiescence in the predominant position of France in that country, the German government now complained of being ignored in the Anglo-French arrangement and proceeded to extend its patronage to ' Abd-el-'Aziz. On the 31st of March 1905 the German emperor landed at Tangier and had conferences with the sultan's representatives. The sultan had declared that he had come to enforce the sovereignty of the sultan, the integrity of Morocco, and the equality of commercial and economic interests. The effect of this intervention was soon apparent. The sultan rejected the scheme of reforms proposed by France, and at the suggestion of Germany issued invitations to the powers to meet his representatives and advise him concerning the reforms needed. The French foreign minister, M. Delcassé, held that there was no need for a conference, but Prince Bülow used menacing language. In the end he was left with no alternative but to resign (July 1905), the French government thereupon agreeing to the holding of a conference. So far the German policy had triumphed; the conference met at Algeciras on the 19th of January 1906 and engaged in the delicate task of reconciling French claims for predominance with the German demand of equality for all. The British delegates gave firm support to their French colleagues, while Austria proved "a brilliant second" to Germany. With great difficulty a scheme of reforms was elaborated, Germany having previously acknowledged the privileged position of France among the Moorish-Algerian peoples.

The general assembly held on the 7th of April 1906, at which the conference was signed on the 7th of April; it was accepted by the sultan on the 18th of June, and the ratifications of the act by the other powers were deposited at the Spanish Foreign Office on the 31st of December 1906. The act provided for a Moorish police force from 2000 to 2500 strong, distributed among the eight open ports of Morocco, to be commanded by Moorish kaisis, assisted by French and Spanish instructors and officers, with a Swiss inspector-general—the arrangement to continue for five years. The act provided also for the institution of a foreign bank (Comptoirs Internationaux de Berlin, etc.), with (a) the acquisition of land round the ports by foreigners, and the consequent payment by them of the regulated or teritó taxes; (b) the more efficient control of the customs administration, first by an annual assessment of the average values of all imports as a basis for the tariff during the following year, and, secondly, by a strict supervision of the administration itself; and (c) the authority of the state over the public services and public works, tenders for which were to be adjudicated impartially without reference to the nationality of the bidder.

Throughout 1906 the controversy between the sultan and the French government continued, and while a Franco-Spanish demonstration off Tangier succeeded in obtaining the removal of Raisûli from the governorship of the town, various outrages occurred (including the murder of a Frenchman in the suburbs of Tangier) for which no satisfaction could be obtained. At length the murder of Dr. Emile Mauchamp at Marrakesh on the 19th of March 1907 determined the French to take prompt action, and Udja was occupied (March 29) by Algerian troops, the French government determining to hold the town until satisfaction had been given to their demands. This satisfaction ' Abd-el-'Aziz promised in May, and some progress was made towards carrying out the Algeciras programme, the state bank being organized in July 1907. Meantime the weakness of the sultan's rule was illustrated in many quarters: near Tangier by the continued activity of Raisûli, that chieftain securing in June another European captive—Sir Harry Maclean, who after over seven months' detention had to be ransomed by the British government for £20,000.

1 Mulai Mahomet, eldest son of El Hasan and a generally popular prince, was released from prison by ' Abd-el-'Aziz early in 1908 and placed in command of his army. On the defeat of 'Aziz by Mulai Hafid, Mahomet contemplated seizing the throne. He was, however, imprisoned by Hafid in the palace at Fez, where he was reported to have died, in mysterious circumstances, in June 1909.

2 Raisûli was seized by the landing of 500 Algerian troops at Tangier (a step taken to secure the release of 'Abd-i-Latif and his stepson, captives of Raisûli), and of a detachment at Rabat.
At Casablanca at this time works were in progress, with the sanction of the sultan, for improving the harbour. The works were beyond the ramparts, close to the Moslem cemetery, and the neighbouring tribesmen (the Shawia) were excited by reports that the cemetery had been desecrated. On the 30th of July they attacked the European labourers and killed nine of them (three French, three Spaniards, and three Italians), afterwards entering the town and raiding the Jewish quarter. Refugees fled by boat to Tangier with news of the massacre. The French government decided to occupy Casablanca, and a strong naval and military force was sent thither. Before the arrival of the troops the commander of the cruiser "Gailiée" landed a party (Aug. 5) to guard the French consulate. The passage of the detachment was opposed, whereupon the "Gailiée", aided by the "Du Chayla" bombarded the town. Casablanca was at the same time entered by the tribesmen, who began a general pillage. On the 7th the French troops arrived and were landed, and further fighting took place. Before order was restored nearly every inhabitant had been killed or wounded or had fled; the dead alone numbered thousands. The European colony was, however, saved. Though masters of the town, the French found the Shawia tribes still full of fight, and, first under General Drude and afterwards (Jan. 1908) under General Amadé, the French proceeded to the reduction of the Shawia country. At one time the expeditionary force numbered 15,000 men.¹ By June 1908 the district was quiet and thereafter the strength of the force was gradually reduced.⁶

The action of France at Casablanca aroused the fanaticism of the tribes of Taifilât and those dwelling near the Algerian border. In November 1907 the Beni Snassen crossed the frontier and were not reduced to submission until after hard fighting. Another outbreak occurred in April 1908, when a French column in the Guir district, west of Figig was surprised, and had difficulty in beating back the enemy. In that and a subsequent engagement, which resulted in the dispersal of the foe in May, the French casualties were over 200. French and Moorish commissioners were then appointed to preserve order along the frontier.

While thus engaged on the eastern frontier and on the Atlantic coast of Morocco France had given financial and moral support to 'Abd-el-'Aziz, whose position was threatened by his brother Mulai Hafid. On the 16th of August 1907, within a fortnight of the bombardment of Casablanca, the ulama of Marrakesh had declared 'Abd-el-'Aziz deposed and Hafid sultan; and from September onwards the tribes round Casablanca opposing the French were supported by troops sent from Marrakesh. Aziz having been furnished with money by the state bank, he was enabled to reach the seaport of Rabat at the head of his army in September 1907. There he was visited by the French minister and appeared willing to grant all the demands of France in return for help against his brother. A loan was forthcoming but no military assistance save that some of 'Abd-el-'Aziz's troops were taken by a French warship to Mazagan. While desultory fighting between the supporters of the rival brothers was proceeding Hafid was proclaimed sultan at Fez on the 4th of January 1908; Hafid now sought support from France, Germany, and other powers, and moving from Marrakesh passed the French lines in the Shawia country, entered Mequinez in May and Fez in June 1908. At length 'Abd-el-'Aziz made an effort to reassert his authority and with a force numbering 4000 he left Rabat in July for Marrakesh. He reached the neighbourhood of that city on the 2nd of August, having received the adhesion of numerous tribes, including the Shawia. On the 19th he started for the final march on Marrakesh. He appears to have been betrayed, for hardly had his force started when it was assaulted on all sides, whereupon the tribesmen deserted in a body and the "regulars" ran away. The day was irretrievably lost and 'Abd-el-'Aziz sought safety in flight. On the 22nd he arrived at Settat in the Shawia country, and within the French lines, with only a handful of followers. For a short time he talked of continuing the struggle, but ended by accepting a pension from his brother Hafid and was assigned a residence in Tangier. That town, the last in Morocco to acknowledge Hafid, did so on the 23rd of August; the change of sultans being accomplished without any disturbance of public order.

Germany was anxious for the immediate recognition of Hafid and caused some perturbation in France by a circular to the powers to that effect dated the 2nd of September; but the French and Spanish governments replied by proposals for guarantees that Hafid would respect the Act of Algeciras. This course received general assent and Hafid having given the guarantees demanded he was formally recognized as sultan at the beginning of 1909. His relations with Europe were made easier by the conclusion, in February 1909, of a Franco-German agreement designed to avoid all cause of misunderstanding between those powers in Morocco. Germany put on record that her interests in the sultanate were "only economic," and France agreeing to "safeguard economic equality." Germany undertook not to impede the political interests of France in the country.

The weakness of the central government was exemplified by the inability of Mulai Hafid to control the Rif tribesmen, who in July 1909 killed a number of European labourers in the neighbourhood of the Spanish fortress of Melilla (q.v.). Spain sent an army of 50,000 men to vindicate its authority. After a severe campaign the Rifians were reduced to submission (Nov. 1909). Though powerless in the Rif, Mulai Hafid's army succeeded in defeating Bu Hamâra's force and in capturing (Aug. 1909) that pretender, otherwise known as el Roghi.³ Bu Hamâra and many of his followers were taken to Fez. The tortures inflicted upon them evoked strong protests from the European powers. In 1910 Mulai Hafid obtained a loan, chiefly from France, of £4,000,000; the greater part of the loan went to liquidate claims by Europeans against the maghzen.

¹ For an account of Bu Hamâra's career see Questions diplomatiques (Oct. 16, 1909).

² Title of sultan adopted about 1649.
MORÓN DE LA FRONTERA—MOROSINI

Ethnology.—Budgett Meakin, The Moors (London, 1902; a magnificent work on manners and customs); James G. Jackson, An Account of the Emir and Moroccos (London, 1809; one of the best and most intimate narratives of the European slaves); Count Sternburg, The Barbarians of Morocco (London, 1903).

Declaration—Rev. José Lercuñhi, Rudimentos del árabe... de-marruecos (Tanger, 1871) and Vocabulario árabe español (Tanger, 1892); Eng. trans. of the former by J. MacIver MacLeod (Tanger, 1910), containing the first full-length English translation of the Arabic vocabulary of the Tangier-Tétouan district; Budgett Meakin, An Introduction to the Arabic of Morocco (Tanger, 1900; vocabulary, grammar, notes, phrases, &c., for pocket use, in Roman characters); Miss C. W. Baldwin, Arabic-English Dialogues (Tanger, 1892; uniform with the last-named, but in Arabic characters).

Maps.—The most trustworthy general maps are R. De Flotte de Roquevaire, Carte du Maroc (scale 1:200,000) 4 sheets, ed. 1908; the French War Office map (scale 1:100,000, begun 1906, scale 1:1,000,000, begun 1909), and the British War Office map (scale 1:1,000,000, 4 sheets, 1904). There are numerous district maps. The best, especially for the western districts, is that of the French Government, 1:100,000 (B. M.; K. A. M.)*

MORÓN DE LA FRONTERA, or Morón (anc. Muros), a town of southern Spain, in the province of Seville; 32 m. S.E. of the city of Seville. Pop. (1900) 14,100. Morón occupies an irregular site upon broken chalk hillocks near the right bank of the Guadaira. It is connected by rail with Utrera on the Cadiz & Seville line. On the highest ground toward the eastward are the ruins of the ancient castle, of considerable importance during the Moorish period, when Morón, as its full name implies, was a frontier fortress; the castle was afterwards used as a palace by the counts of Ureña. In 1810-1811 it was fortified by the French, but blown up the following year.

The chief public building of Morón is the large parish church, which dates from the 16th century. Morón is also famous throughout Spain for its marble and its chalk (cal de Morón), from which the whitewash extensively used in the Peninsula is derived.

MORONE, GIOVANNI (1509-1558), Italian cardinal, was born on the 25th of January 1509 at Milan, where his father, Count Ieronimo Morone (d. 1529), was grand chancellor. His father, who had been imprisoned for opposing encroachments on the liberties of Milan by Charles V. (whom he afterwards cordially supported), removed to Modena, where his youngest son had most of his early education. Proceeding to Padua he studied jurisprudence with distinction. In return for important service rendered by his father, he was in 1527 nominated by Clement VIII. to the see of Modena, and consecrated in 1533 after a contest. From 1535 he was constantly entrusted by Paul III. with diplomatic missions; he was nuncio (1536) to Ferdinand, king of the Romans, and legate to the diet of Spires (1542) having successfully resisted the transfer of the diet to Hagenau on account of the plague (1540). On the 31st of May 1542 he was created cardinal, and was further nominated protector of England, Hungary, Austria, of several religious orders, and of the santa casa at Loreto. With the cardinals Paul Pariso and Reginald Pole he was deputed to open the Council of Trent (Nov. 1, 1542), the place of meeting having been a concession to his diplomacy. The legates arrived on the 22nd of November, but no council assembled. The death of Paul III. (1549) deprived him of a good friend. The views of the Reformers had spread in his diocese, and he was suspected of temporizing with them. He resigned his see (1550) in favour of his brother Tommaso, and Foscherari (ed. Roger) a favorite annual pension and the patronage of living. Julius III., at the instance of the duke of Milan, gave him (1553) the rich see of Novara (which he resigned in 1560 for the see of Albano) and sent him as nuncio to the diet of Augsburg (1553), from which he was immediately recalled by the death of Julius (March 23). In June 1557 Paul IV. imprisoned him in the castle of St Angelo (with others, including Pole, and Foscherari), on suspicion of Lutheran heresy. The prosecution entirely failed, and Morone might have had his liberty, but refused to leave prison unless Paul IV. publicly acknowledged his innocence. He remained incarcerated till the pope's death (Aug. 18, 1559), and took part in the election of Pius IV. Ochino, in the twenty-eighth of April, 1559, has a colloquy on the treatment of heretics, between Pius IV. and Morone, in which the latter maintains: "Errantes in viam revocandi, occidendi.

This really hits the position of Morone, a sincere Catholic, to whom persecution was abhorrent. He presided at the Trinitarian Council from the 10th of April to the 4th of December 1553, and endeavoured to exercise a conciliatory influence. At the end of 1546 Foscherari died, and Morone was reinstated in the see of Modena. On the death of Pius IV. in December 1565, he became vice-regent for being elected pope. His last days were easy; he died at Rome on Christmas Day, 1566, and was buried at S. Maria sopra Minerva. His writings comprise a few letters and orations. His career is that of a good man, struggling for the welfare of his Church against corrupt princes, and not to the system to which he was devoted.

See J. G. Fricke, "De Joanne Morone," in J. G. Schelhorn's Amoenitates litterales, vol. xii. (1750); "G. Moroni." Dizionario di erudizione filologico-letteraria, 1542; N. Bernabò, Vita cardinale G. Moroni (1865); M. Young, Life and Times of Annio Paeckero (1860); C. Brunetti, Storia del Realencyclopädie (1903). (A. Go.)

MORONI, GIAMBATTISTA (c. 1512-1578), Italian portrait-painter of the Venetian school, was born at Albino near Bergamo about 1512 (or perhaps a few years later), and became a pupil of Bonvicino named II Moretto. Beyond the record of his works very few particulars regarding him have reached us. Titian, under whom also Moroni, while still very young, is said to have studied (but this appears hardly probable), had at any rate a high opinion of his powers; he said that Moroni made his portraits "living," and "actual images." (see. In truthful and animated portraits Moroni ranks near Titian himself. His portraits do not indeed attain to a majestic monumental character; but they are full of straightforward life and individuality, with genuine unforced choice of attitude, and excellent texture and arrangement of drapery. There is a certain tendency to a violet-tint in the flesh, and the drawing and action of the hands are not first-rate. The earliest inscribed date discovered for any of his works is 1553. As leading samples may be mentioned—in the Uffizi Gallery, Florence the "Nobilieman pointing to a Plane," inscribed "Et quid volo nisi ut arcat?": in the National Gallery, London, the portraits of a Tallor, a Member of the Fenaroli family, Canon Ludovico de Terzi, and others; in the Berlin Gallery, his own portrait; and in Stafford House, the seated half-figure of the Jesuit Ercole Tasso, currently termed "Titian's Schoolmaster"—not as indicating any real connexion between the sitter and Titian, but only the consummate excellence of the work. Besides his portraits, Moroni painted, from youth to his latest days, the ordinary round of sacred compositions; but in these he fails below his master II Moretto. One of the best is the "Coronation of the Virgin," in S. Alessandro della Croce, Bergamo; also in the cathedral of Verona, "SS Peter and Paul," and in the Brera of Milan, the "Assumption of the Virgin." Moroni was engaged upon a "Last Judgment," in the church of Cortago, when he died on the 5th of February 1578. (W. R. M.)

MOROSINI, a noble Venetian family, probably of Hungarian extraction, which gave many dogs, statesmen, generals and admirals to the Venetian Republic, and cardinals to the Church. It first became prominent at the time of the emperor Otto II. owing to its rivalry with the Ca'loriani family, whom it succeeded in negociating by the marriage of Domenico Morosini (d. 1550), elected doge in 1148, waged war with success against the Dalmatian corsairs, recapturing Pola and other Istrian towns from them. Marino Morosini (d. 1523) was elected doge in 1429; Michele was doge from June 1382, until his death in October of the same year.

ANDREA MOROSINI (1558-1618) was a famous historian and was entrusted by the Venetian senate with the task of continuing Paolo Paruta's Annales Veneti, in Latin. His history of Venice was published by his brother in 1623 (Venice), and translated into
Italian by Senator Girolamo Molin (Venice, 1782). Among his other works are: Le Imprese ed edizioni di terra santa, &c. (Venice, 1637); De ies que veneta respuncta ad Istriae oras gessit, &c. (in the Corner-Duodo collection of MSS; De forma republieae venetiae in MS. in the Bibliothèque Nationale in Paris. His life has been written by Girolamo Molin (1652), by Nicolo Crasso (1621), and by Antonio Palazzoli (1620).

FRANCESCO MOROSINI (1618-1694) was one of the greatest captains of his time. As a young man he fought against the Turks and the pirates, and after signally distinguishing himself at the battle of Naxos in 1669 he was appointed commander-in-chief of the Venetian navy. He then conducted a series of successful campaigns against the Turks, but was recalled in consequence of the intrigues of his rival the Provveditore Antonio Barbaro (1661). But while Candia was attacked by a large force, under the terrible vitez Keuprili, Morosini was sent to relieve the fortress in 1667; the siege lasted eighteen months, but Morosini, in spite of his prodigies of valour, was forced to surrender to save the surviving inhabitants. He was tried, but acquitted of all blame, and on the renewal of the war with the Turkish Empire in 1684 he was again appointed commander-in-chief, and after several brilliant victories he reconquered the Peloponnesus and Athens; on his return to Venice he was loaded with honours and given the title of "Peloponnesico." In 1688 he was elected doge, and in 1693 he took command of the Venetian fleet. His first task was to scatter the enemy which had been cruising in the archipelago without his approach, so great was the terror inspired by his name. While wintering at Napoli di Romania (Nauplia) he died on the 6th of January 1694.

MORPETH, a market town and municipal and parliamentary borough of Northumberland, England, situated in a fine valley on the Wansbeck, 173 m. N. of Newcastle by the North Eastern railway the junction of several branches with the main line. Pop. (1901), 6158. The Wansbeck winds round the town on the west, south and east, and a rivulet, the Cottingburn, bounds it on the north. The parish church of St Mary, a plain building of the 14th century, is situated on Kirk Hill, a short distance from the town. About a mile to the north, near the lodging of the bishop of Durham, stands the ancient priory of St Mary Magdalene. The market of Morpeth was held on Wens Day every year, and the church was dedicated to St Mary Magdalene. Roger de Merlay and his heir granted the town in 1262 under the government of two bailiffs who were chosen every year in the following manner: the bailiffs for the time being chose two juries from whom the commonly elected four burgesses, and from these four the steward of the lord of the manor appointed the bailiffs for the ensuing year. This was continued until the Municipal Reform Act of 1835. In 1688 the market of Wens Day at Morpeth was held by the husband of St Mary Magdalene were granted to Roger de Merlay, and in 1685 the fair was extended for two days. The market rights still belong to the lord of the manor.

MORPHEUS, in Roman mythology, one of the sons of Somnus, the god of sleep. He was a personification, apparently invented by Ovid (Metam. xi. 635), of the power that calls up human shapes (μούπαλος) of all kinds to the dreamer. His brothers Phobetor and Phantasus assumed the forms of all kinds of animals and inanimate things.

MORPHINE, the chief alkaloid of opium (q.v.), to which the medicinal action of the former is mainly due. It is not used itself in medicine owing to its insolubility in water and ether. The preparations of morphine are incompatible with salts of iron, copper and mercury, also with lime water and alkaline earths and substances containing tannin. With ferric chloride it forms a deep red colour.

The preparations of morphine in the British Pharmacopoeia are: Morphine Hydrochloridum and are made from the preparations: (1) Liquor Morphinae Hydrochloridum, strength 1% or about 4g. grs. of the hydrochloride to the fl. oz.; (2) Suppositoria Morphinae, made with a basis of oil of theobromina, strength 3 gr. of morphine hydrochloridum in 10 minims; (3) Tinctura Morphinae, strength 1/4 gr. in 10 minims; (4) Tinctura Morphinae and 1/4 gr. in each; (5) Tinctus Morphi et Ipecacuanha, strength 1/2 gr. of morphine hydrochloridum and 1/4 gr. ipecacuanha in each; (6) Morphi et Ipecacuanha, a white soluble mixture of powdered morphine and ipecacuanha powder, is made Liquor Morphinae Acetatis, strength 1% or 45 g. grs. of the acetate to fl. oz. From Morphinae Tartris, a white crystalline powder, are prepared, Insecto Morphinae Hypodermica, containing 5% of morphi tartrate, and Liquor Morphinae Tartratis. Morphinae Sulphatis is not official in the British Pharmacopoeia but is official in the United States, the U.S.P. Tarciessi Morphinae et Ipecacuanhae and Pilus Morphinae Composita (Tully’s powder) being made from it. Hypodermic tablets of morphine sulphate either alone or combined with atropine are much in use. Various non-official preparations of morphine are in use, such as diona, heroine, glycochorn and peronin.

Therapeutics.—Morphine is an analgesic and hypnotic, relieving pain and producing deep sleep. As contrasted with opium it differs in being less astringent and constipating. Morphine is the greatest anodyne we possess, and no drug yet discovered equals it in pain-relieving power. The most frequent mode of administration is the hypodermic method, on account of the extreme rapidity with which it is absorbed. In pain due to colic and dyspepsia, it is administered as a decorative and soothing tincture by the injection of morphine directly into the muscle of the affected part, and in the treatment of renal and hepatic colic morphine given subcutaneously will relieve the acute pain consequent on the passage of biliary and urinary calculi. A violent paroxysm of asthma may be arrested by the administration of morphine subcutaneously, but the practice should not be continued, as there is great danger in a chronic disease that the patient may become the victim of morphinism. Morphine is recognized as one of the most useful drugs in the treatment of eclampsia, early injection often arresting the fits.

In bronchitis and croup, the injection of morphine at regular intervals in this particular disease morphine is frequently better replaced by codein or by heroin, which checks irritable coughs without the narcotism following upon the administration of morphine. In bronchitis with profuse expectoration the use of morphine is particularly dangerous, as it is likely to check the cough so necessary for getting rid of the secretion, but in the converse condition it usefully allays the harassing cough by diminishing the excitability of the respiratory centre. In the dyspnoea of advanced tubercular disease of the heart morphine relieves the distress and restlessness, and induces sleep. It should however be withheld if the heart has undergone fatty degeneration. Morphine is a sheet anchor in the later stages of cancer and other painful diseases, rendering the life of the patient one of comparative comfort. If given in excess the drug is eliminated by way of the intestines and kidneys. It
MORPHOLOGY

863

is also excreted in the milk; hence the danger in the administra-
tion of large doses of morphine to nursing mothers.

Morphine-scopolamine anaesthesia was introduced in 1902
by Steinbückel. It has been used by some surgeons for the pro-
duction of anaesthesia previous to the administration of ether
or chloroform, but the use of the method is now more
usually relegated to obstetric practice.

Chronic morphine poisoning is very common, and the patient
acquires a habit. Once the habit is acquired, the patient
becomes virtually tolerant of the alkaloid the organism
develops from the drug it has been accustomed to. The usual
amounts, which have been indulged in by the habitual morphinist
may reach an astonishing figure; 15 gms. a day is said to be common,
and some medical writers record quantities such as 60 to 70 gms.
in 24 hours in extreme cases. The symptoms of morphine
withdrawal appear in the patient who has been addicted to the
drug for a long time. The patient becomes restless, and, if
the drug is suddenly stopped, there is likely to be nausea,
and, finally, convulsions. The withdrawal symptoms
are usually more marked when the drug is stopped after
long periods of constant administration, than after
shorter periods of its use. The withdrawal symptoms
may be marked by nervous symptoms, such as
violent shivering, tremulousness, delirium, convulsions,
and beriberi. Morbidity is increased, and the patient
becomes more sensitive to external stimuli. The
withdrawal symptoms may be greatly diminished
by the administration of a weak solution of
morphine hydrochloride, or by the use of a
weak solution of morphine hydrochloride in
a diluent such as a solution of sodium
bicarbonate.

Historical Outline.—If we disregard such vague likenesses
as those expressed in the popular classifications of plants
by size into herbs, shrubs and trees, or of terrestrial animals
by habit into beasts and creeping things, the history of morphol-
gy begins with Aristotle. Founder of comparative anatomy
and taxonomy, he established eight great divisions (to which are
added certain minor groups)—Viviparous Quadrupeds,
Birds, Oviparous Quadrupeds and Apeida, Fishes, Malakia, Mala-
costraca, Entomo, and Ostracodermata—distinguishing the first
four groups as Eudice ("with blood") from the remaining four
as Anatome ("bloodless"). In these divisions he recognized the
Vertebrata and Invertebrata of J. B. P. A. Lamarck, the
first four groups corresponding with the Mammals, Birds,
Reptiles, Fishes, whilst the others agree more loosely with
the Cephalopods, Crustacea, Insecta, and Echinoderms with Mollusca
other than the Cephalopods. Far from committing the mistake
attributed to him of reckoning Bats as Birds, or Cetaceans as
Fishes, he discerned the true affinities of both, and erected
the latter into a special 400s beside the Viviparous Quadrupeds,
more on account of their absence of limbs than of their aquatic
habit. Not only the bodily powers, but the mental and
the progress of development from a general to a special form
is preceded by the development of the limbs. His work,
discerned the characteristic power of the fins of Fishes
and the limbs of Quadrupeds, the idea of homology
is not to be found in the book. The animal kingdom
is divided into two great phyla—"artificial"
and "natural"—the former depending on the presence
of vertebral column, the latter on the presence
of fins. These two phyla are divided into five
subphyla, the first three of which are
the "animalia"—the "artificial"; the last
two are the "animalia"—the "natural".

The classification of animals is
not only by the art, but also
by the natural characteristics,
and method, but by the subordination of the species under
the successive higher categories of genus, order and class, so
reconciling the analytic and synthetic tendencies of his predecessors.

Although the classification of plants by the number of their
essential organs is highly artificial, it must be remembered
that this artificiality is after all only a question of degree,
and that he not only distinctly recognized its provisional character
but collected and extended those fragments of the natural
system with which A. de Jussieu soon afterwards began to
build. His classification of animals, too, was largely natural,
and, though on the whole he lent his authority to maintain the notion
of three kingdoms of nature, he at least at one time discerned
the fundamental unity of animals and vegetables, and united
them in opposition to the non-living world as Organisms.
At the time he was still far more a scholar than a naturalist; but his
work was the starting point of the modern system of classification.
Candolle and Robert Brown. The former concentrated his own long life and that of his son upon a new "systema naturae," the colossal Prodrumus systematis naturalis (20 vols., 1829-1853), in which 80,000 species were described and arranged. Meanwhile, the penetrative genius of Brown enabled him to unravel such structural complexities as those of Conifers and Cycads, Orchids and Proteaceae, thus demonstrating the possibility of ascertaining the systematic position of even the most highly modified floral types. Both Candolle and Brown were thus no mere systematists, but genuine morphologists of the modern school.

The labours of Bernard and Antoine de Jussieu initiated a parallel advance in botany, the joint memoir on the classification of mammals with which Cuvier and Geoffroy St-Hilaire almost began their career receiving its dominant impulse from the genius of Antoine. Cuvier's works correspond in zoology to those of the whole period from the Jussieus to Brown, and epitomize the results of that line of advance. Although in some respects preceded by A. von Haller and J. Hunter, who compared, though mainly with physiological aim, the same parts in different organisms, and much more distinctly by Viciq d'Azyr, the only real comparative anatomist of the 18th century, he opens the era of detailed anatomical research united with exact comparison and classification with the evolutionary view. (1817) and the theory of types (vertebrate, molluscan, articulate, and radiate) are the results of this union of analysis and synthesis and mark the reconstitution of taxonomy on a new basis, henceforth to be no longer a matter of superficial description and nomenclature but a complete expression of structural resemblances and differences. In Germany, L. H. Bojanus, J. F. Meckel, C. T. E. von Siebold and Johannes Müller, with his many pupils, carried on the work; in France, too, a succession of brilliant anatomists, such as A. de Quatrefages, A. Milne-Edwards and H. de Lacaee-Duthiers, were his intellectual heirs; and in England he has been admirably represented by Sir R. Owen.

It is now necessary to return to Linnaeus, whose more speculative writings contain, though encumbered by fantastic hypotheses, the idea of floral metamorphosis. About the same time, and quite independently, C. F. Wolff, the embryologist, stated the same theory with greater clearness, for the first time distinctly reducing the plant to an axis bearing appendages—the vegetative leaves—which become metamorphosed into bud-scales or floral parts through diminution of vegetative force. This view was independently developed by Goethe in his now well-known pamphlet (Versuch die Metamorphose der Pflanzen zu erklären, Gotha, 1790). In this brilliant essay the doctrine of the fundamental unity of floral and foliar parts is clearly enunciated, and supported by arguments from anatomy, development and teratology. All the organs of a plant are thus modifications of one fundamental organ—the leaf—and all plants are in like manner to be viewed as modifications of a common type—the Urpfanne. Whether, as some historians hold, his "Urpfanne" was a mere ideal architype, bringing forth as its fruit the innumerable metaphysical abstractions of the Naturphilosophie, and leading his countrymen into all the extravagances of that system; or whether, as E. H. Haeckel maintains, it represented a concrete ancestral form, so anticipating the view of modern evolutionists, it is certain that to him F. W. S. von Schelling was indebted for the foundation upon which he erected his philosophic edifice, as also that Goethe shared the same ideas. It must be remembered that he lived and made progress for forty years after the publication of this essay, that he was familiar with the whole scientific movement and was, as it were, immersed in the evolutionary force. Thirty of Lamarck and Geoffroy St-Hilaire; it is not therefore to be wondered at that his writings should furnish evidence in favour of each and every interpretation of them. His other morphological labours must not be forgotten. Independently of Viciq d'Azyr, he discovered the human premaxillary bone; independently of L. Oken, he proposed the vertebral theory of the skull; and before S. C. Savigny, he discerned that the jaws of insects were the limbs of the head.

In 1813 A. P. de Candolle published his Théorie élémentaire de la botanique, which he developed into the classic Organographie végétale (1827). He established his theory of symmetry, reducing all flowers to "symmetrical" groupings of appendages on an axis and accounting for their various forms by cohesion and adhesion, by arrested or excessive development. The next advance was the investigation by W. P. Schimper and A. Braun of phyllotaxis—the ascending spiral arrangement of floral and organax—thus further demonstrating their essential unity.

The term morphology was first introduced by Goethe in 1817, in a subsequent essay (Zur Naturwissenschaft überhaupt, besonders zur Morphologie). It did not come into use in botany until its popularization by Auguste de St-Hilaire in his Morphologie végétale (1841), and in zoology until later, although De Blainville, who also first employed the term type, had treated the external forms of animals under "morphologie." Though the Naturphilosophie of Schelling and its countless modifications by his followers, its mystic theories of "polarization" and the like, its apparatus of assumption and abstraction, hypothesis and metaphor, cannot here be discussed, its undoubted services must not be forgotten, since it stimulated innumerable reflective minds to the earnest study of natural science, gauging the value of its methods and the efficacy of its conclusions.

The term morphological, and its accompanying terms like, metaphorical, others mystical or poetic, others, again, more especially scientific; but its most typical and picturesque figure is Lorenz Oken, who epitomizes alike the best and the worst features of the school, and among whose innumerable pseudo-morphological dreams there occasionally occurred suggestions of the greatest fruitfulness—notably, for instance, the independent statement of the vertebral theory of the skull.

By far the most distinguished anatomist of the transcendental school is Geoffroy St-Hilaire, who being comparatively free from the extravagances of Oken, and uniting a depth of morphological insight scarcely inferior to that of Goethe with greater knowledge of facts and far wider influence and reputation in the scientific world, had greater influence on the progress of science than either. He started from the same studies of anatomical detail as Cuvier, but, influenced by Buffon's view of unity of plan and by the evolutionary doctrines of Lamarck, the Academy of Sciences. On the point of fact he was of course utterly defeated; the type theory was henceforward fully accepted and the Naturphilosophie received its death-blow. Such was the popular view; only a few, like the aged Goethe, whose last literary effort was a masterly critique of the controversy, discerned that the very reverse interpretation was the deeper and essential one, that a veritable "scientific revolution" was in progress, and that the supremacy of homologous and synthetic over descriptive and analytic studies was
thenceforward assured. The irreconcilable feud between the two leaders really involved a reconciliation for their followers; theories of homological anatomy had thenceforward to be strictly subjected to anatomical and embryological verification, while anatomy and embryology acquired a homological aim. This union of the solid matter and rigorous method of Cuvier with the generalizing spirit and philosophic aims of Geoffroy is well illustrated in the works of Owen.

The further evolution of the idea of homology is sketched below. It was due to the rapidity of the subsequent progress of the knowledge of all the structural appendages of animals alike that a historical survey makes a historical survey impossible up to the appearance of the Origin of Species (1859). The needful solution was effected by Darwin. The "Urphilanze" of Goethe, the types of Cuvier, and the like, at once became intelligible as schematic representations of ancestral organisms, which in various and varying environments, have undergone differentiation into the vast multitude of existing forms. All the enigmas of structure become resolved; "representative," and "aberrant," "progressive," and "degraded," "synthetic," and "isolated," "persistent," and "prophetic," types no longer baffled immediate conformity to type differentiated by differentiated or rudimentary organs in one organism is no longer contradicted by their entire disappearance in its near allies, while systematic and morphologist became related simply as specialist and generalizer, all through this escape from the Linnaean dogma of the fixity of species. The phenomena of individual development receive interpretation in terms of ancestral history; and embryology thus becomes divided into ontogeny and phylogeny—the latter, too, in its relative and absolute forms. Recognition of the fact of the emergence of the morphology of the vertebrate and plants as a cell-community, in which the separate elements were like the bees of a swarm—a view virtually concurred in by all essential systematists by M. Schleiden, R. Virchow and others, while the nominally converse view—that of the leaf as a mere outward expansion of the stem-segment—was proposed by C. B. de Saussure.

Though sundry attempts at identifying various tissues, such as the fibro-vascular bundles, as the constituent individuals may be passed over, those associated with the cell theory are of great importance. Schwann 1839 and Virchow 1845 regarded a plant as a cell-community, in which the separate elements were like the bees of a swarm—a view virtually concurred in by all essential systematists by M. Schleiden, R. Virchow and others, while the nominally converse view—that of the leaf as a mere outward expansion of the stem-segment—was proposed by C. B. de Saussure.

So far the theories of individuality. The conception of relative individuality was first clearly expressed by Alphonse de Candolle and Schleiden, both of whom took the cell, the shoot and the multi-axial plant as forming three successive and subordinated categories. K. W. von Nägeli too recognized not only the necessity of establishing such a series (cell, organ, bud, leafy axis, multi-axial plant) but the distinction between morphological and physiological individualities afterwards enunciated by Haekel.

Passing over the difficulties which arise even among the Protozoa we find that a similar controversy (fully chronicled in Haekel's Kryptogame) has arisen concerning the particularity of sponges. While the older observers were content to regard each sponge as an individual, a view in which J. N. Lieberkühn and other monographers substantially concurred, the application of the microscope led to the view, adopted by J. H. Streenstrup and criticized by H. J. Carter, that the sponge is a city of amoeboid or infusorian individuals. K. W. von Nägeli was the first to propose that a sponge be regarded as a "alternation of generations" as a mode of origin of distinct individuals by two methods, for him fundamentally similar, the sexual from unimaginated females and the asexual from unimaginated "nurses."—a view adopted by Edward Forbes and many other naturalists, but keenly criticized by W. B. Carpenter and T. H. Huxley. In R. Leuckart's remarkable essay on polymorphism (1853) the Siphonophores were analyzed and shown to be structurally a number of interdependent individuals; the difference in size and shape is due to the differences in the proportions of feeding and reproductive parts, and the whole being a "alternation of generations." In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations.

For the higher animals the problem, though perhaps really even more difficult, is less prominent. As Haeckel points out, the earlier discussions and even the comparatively late essay of Johannes Müller take an almost purely psychological or at least a physiological point of view; and the morphological aspect of the inquiry only came forward when it was found that the suspicion that certain worms (see Platyhelminia) or Siphonophores (see Hydrozoa) had the difficulties with which botanists had so long been familiar. With the rapid progress of embryology, too, the more recent discussions are more strictly physiological, and the development of the embryo is regarded as the "alternation of generations" as a mode of origin of distinct individuals by two methods, for him fundamentally similar, the sexual from unimaginated females and the asexual from unimaginated "nurses."—a view adopted by Edward Forbes and many other naturalists, but keenly criticized by W. B. Carpenter and T. H. Huxley. In R. Leuckart's remarkable essay on polymorphism (1853) the Siphonophores were analyzed and shown to be structurally a number of interdependent individuals; the difference in size and shape is due to the differences in the proportions of feeding and reproductive parts, and the whole being a "alternation of generations." In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations. In the case of Polyporia and other forms it is due to the alternation of generations.
animal, as Galles had done the plant, as the entire product of an individual one—the swarm of Aphides or tree Medusae which in this way might belong to a single individual being termed Zooids.

In Carus's _System of Animal Morphology_ (1853) another theory was propounded, but the principles by which it was carried out were so deeply involved into an antecedent theory that it formed the subject of a prolonged and fruitful discussion in the _Principles of Biology_. Adopting the cell (defined as an aggregate of the lower order, itself formed of physiological and morphological unit) as the fundamental unit, Haeckel has permitted or even induced by the theory that any cell or cells, which may either exist independently, or gradually exhibit unions into aggregates of the second order, like the lower Algae, of which the individuality may be less or more pronounced. Thus, in the case of the lower aggregates or compartments, the whole individuality, or yet higher order is then traced through such intermediate forms as are represented by the higher seaweeds or the liverworts, from the thallus of which the axes and appendages of the plants sub-sciences are successively derived. The shoal of a flowering plant is thus an aggregate of the third order; it branches into an aggregate of the fourth or higher order, and finally as a tree to acquire a degree of composition too complex to be any longer defined. Proceeding to animals, the same method is applied. The Protozoa are aggregates of the first order. These, like plants, exhibit transitions, of which Radiolarians, Foraminifera and sponges are taken as examples, to such definite compound wholes as _Hydra_; and such secondary aggregates multiply by gemmation into permanent aggregates of the third order, which may exhibit all degrees of integration up to that of the _Coelenterata_, where the colonies finally lost in the _Protozoa_. The whole series of articulated animals are next interpreted as more or less integrated aggregates of the third order, of which the lower _Annelida_ and _Mollusca_ are developed from an original tissue, more or less highly integrated and individualized. Molluscs and vertebrates are regarded as aggregates of the second order.

In 1866 appeared a morphological classic, the _Generelle Morphologie der Organismen_. Here pure morphology is distinguished into two sub-sciences—the first purely structural, _textology_, which regards the organism as composed of organic individuals of different orders; the second essentially stereometric, _protology_, and _tectology_, defined as the science of organic individuality, a large section of the work is devoted. Dismissing the theory of absolute individuality as a metaphysical figure, and starting from the view of Schleiden, De Bary and the _Naturphilosophen_—that every cell is an individual, he distinguishes more clearly than heretofore the physiological individual (or _bion_), characterized by definiteness and independence of function, from the morphological individual (or _persona_), formed by a system of individuals, or units, of which the latter he establishes six categories, as follows—

1. **Plastides** (cytodes and cells), or elementary organisms.
2. **Organs** (cell-stocks or cell-fusions), simple or homoplastic organisms, or heteroplastic organisms, _Organ-systems_, _organ-apparatuses_.
3. **Antimeres** (opposite or symmetrical or homotypic parts), _e.g._ metameric animals, "halves of bilaterally symmetrical animals."
4. **Metameres** (successive or homodynamous parts), _e.g._ stem-segments of Phanerogams, segments or zones of Annelids and Echinoderms.
5. **Personae**, shoots or buds of plants, _polyplas of Cocleenterates_, &c., "individuals" in the narrow sense among the higher animals.
6. **Coelom-stocks or colonies**, _e.g._ trees, chains of Salpas, polyp-stocks, &c.

In his subsequent monograph on calcareous sponges, and in a final work, he somewhat modifies these categories by substituting one category of extreme comprehensiveness, that of the _idorgas_, in place of the three separate orders of organs, antimeres and metameres. The _Idorgan_ (of course clearly distinguished from the _physiological organ_ or _bion_) is finally defined as a morphological unit consisting of two or more plastids, which do not possess the positive character of the person or stock. These are distinguished into _homoplastis_ or _homo-organisms_ or _allopastis_ or _allo-organs_, the former two _homoplastics_ being distinguished by groupings of individuals or cells, the latter _idomeris_ or _idomers_, metameres and antimeres. The former definition of the _term antime_, as denoting at once each separate ray of a radicle, the right and left halves of a bilaterally symmetrical animal, is corrected by terming each ray a _paramere_, and its symmetrical halves the antimeres. Thus an ordinary _Medusa _ has four parameres and eight antimeres, a starfish five and ten. These categories are then modified by the following rules: (1) There is no idorgan in a person, nothing but the axes and accessory ground upon which the waving of the _coelomstock_, or the yoke of a _Porifera_ is based. (2) In drawing the comparison of the animal with the vegetable shoot and by omitting the antime and metamere as necessary components, but by taking the central embryonic form of all the _Metazoa—the_ gastrula—as the simplest and oldest form of person. The different morphological stages to which it may attain are classified into three series: _ectoderm_, _endoderm_, and _metameres_, e.g. annelids, arthropods, vertebrates. The colonies of _protozoa_ are mere idorgas. True corals, composed of united personae, occur only among sponges, hydrozoans, siphonophores, and echinoderms, of which the apparent individuality is formed by a complexly subdivided personae, usually central personae, of a radially budded worm colony; and these can be classified according to the morphological rank of the _operculum_; as such, as an aggregate of the lower order are derived by gemmation from a single personae, yet in sponges and corals occasionally by fusion of several originally distinct personae. Of the theory of successive subordinate orders of individuality being thus not only derived from the development of the coordinate, but essentially determined by the _exogon_, _protology_, and _tectology_, is levitated by the _exogon_, _protology_, and _tectology_, is levitated by the

---

(After Haeckel)

**Fig. 33.** Gastrola in optical section, showing primitive opening and digestive cavity (blastopore) and archeogonia, but also outer and inner layers, ectoderm and endoderm.
arise merely, as Jäger expresses it, from that concentric lamination, or, with Perrier, from that polymorphism of the members of the colony, which is associated with organic and social existence. The idea of the anteinner omitted, as being essentially a pronomorphological conception (for such a study belongs to the domain of the social order, the last distinct order of individuality, is entirely so divisible); that the metamere is convenient to denote the secondary units of a linear tertiary individual; the term persona, however, seems unlikely to survive, not only on account of the monstrosity of its connotations, but because it has been somewhat vaguely applied alike to aggregates of the second and third order; and the term colony, even or deme may indifferently designate the aggregates of primary, secondary, tertiary or quaternary order which are, however, integrated into a whole, and do not reach the full individuality of the next higher order. The term zooid is also objectionable since it gives the idea of a divisible individual which may be merely a piece of something natural while the medusoid gonophores of a hydroid were looked at as evoluted from its homologue in Hydra, whereas the latter may be a degenerate form of the former. Such a differentiation of the primary, secondary, and tertiary units, as we find them in the primitive starfish, are the most convenient and logical way of ar esting the simple geometrical ground-forms of crystals with the highly curved and hopelessly complicated lines and surfaces of the organism.

But there are other considerations which lead up to a mathematical conception of organic forms, namely, by symmetry and regularity. These, however, are usually but little developed, botanists since Schleiden containing themselves with throwing organisms into three-fold categories—first, single; second, regular and radiate; third, symmetrical bilaterally or zygomoraphically—the last being capable of division into two halves only in a single plane, the second in two or more planes, the first in none at all. H. C. B. Burmeister, and more fully H. G. Bronn, introduced the fundamental improvement of defining the mathematical forms which they sought not by the surfaces but by its axes and their poles; and Haeckel has developed this into a method with an elaborateness of detail and nomenclature which seems, unfortunately, to be a little redundant, but of which the main results may, with slight variations chiefly due to Jäger (Lehr. d. Zool. i. 283), be briefly outlined.

I. HOMAXONIA, all axes equal.
(a) Spheres, where a definite number of equal axes can be drawn through the middle point, e.g. Sphaeraeum.
(b) Polyhedra, with a definite number of like axes.

Of these, a considerable number occur in nature, for example, many radiolarians (fig. 3), pollen-grains, &c., and they are again classifiable by the number and regularity of their faces.

1. Pteraxonia, where all the parts are arranged round a main axis, and of these we distinguish—
(a) Homaxonia, with not more than one definite axis. Here are distinguished (a) those with similar poles, spheroid (Coccidius) and cylinder (Pyrosoma) and (b) those with dissimilar poles, cone (Conulina).

2. Stauraxonia, where, besides the main axis, a definite number of secondary axes are placed at right angles, and the stereometric ground-form becomes a pyramid. Here, again, may be distinguished (a) those with the similar poles, such as Stauraxonia homopola, where the stereometric form is the double pyramid (fig. 3), and (b) those where the similar poles are not, as Stauraxonia heteropola, as they may be easily distinguished with reference to the basal plane, as a single pyramid, a triangle, an oval, or a semicircle. There are bases of these may be considered as fused to the primary axis; such as irregular polygons, and thus a new classification into Homostaura and Heterostaura naturally arises.

The simpler group, the Homostaura, may have either an even or an odd number of sides, and thus among the Homostaura we have the regular, single and double pyramids.

In those Homostauria with an even number of sides, as medusae, the radial and inter-radial diameters are equal; whereas in those with an odd number of sides, as most echinoderms, each of the transverse axes is half radial and half semi-radial (fig. 5). Of the group of regular double pyramids the twelve-sided pollen-grain of Passiflora may be taken as an example, having the ground-form of the hexagonal system, the hexagonal dodecahedron. Of the equal even-sided single pyramids of Stauraxonia the homopolar, Geryonia, Aurelia, may be taken as examples of the eight-sided, six-sided, and four-sided, pyramids, which are represented by Opiatia or Primula with five sides, and the flower of lily or rush with three sides.

In the highest and most complicated group, the Heterostaura,
the basal polygon is no longer regular but amphitheatric (αμφιθεατρόν = double-edged). Such a polygon has an even number of sides, and can be divided into symmetrical halves by each of two planes intersecting at right angles in the middle point, and thus dividing the whole figure into four congruent polygons. The longer of these axes may be named the lateral, the shorter the equatorial or dorso-ventral; and these two axes, along with the main axes, always define the three-dimensional space occupied by the five-sided figures. Thus a Gyrocoelus (fig. 6) furnishes examples of eight-sided amphitheatric pyramids, some Madreporite Corals of six-sided, Cruscifers, some Medusae, and Cestodes of four-sided amphitheatric pyramids.

In these forms the poles of the dorso-ventral axis and the equatorial axes are the same, or nearly so, and thus the homotypy of the central point are called Centrormata. There are, however, other forms and these the most complicated, in which the poles of at

**MORPHOLOGY**

**Fig. 5.—**Starfish, an example of Heteropoda homostoma. Ground-form a regular single pyramid of five sides.

---

**Fig. 6.—**Ctenophore (Eucharis). Ground-form an eight-sided amphitheatric pyramid.

---

**Fig. 7.—**Spatangus. Ground-form a five-sided half amphitheatric pyramid.

---

...least the dorso-ventral axis are unlike, and in which the body is thus defined not with reference to a line but to a median plane, and has become thereby a true five-sided figure. Their ground-form is a polygon with an even number of sides, which can only be divided into two symmetrical halves by the one median plane. It can be obtained by halving an amphitheatric pyramid of double the number of sides, and is consequently termed a half amphitheatric pyramid (fig. 7). The whole amphitheatric pyramid may be most conveniently obtained by the reduplication of the ground-form as it appears in a mirror. Of half amphitheatric pyramids there are again two forms, termed by Haeckel Amyphileura and Zygo-pleura, the former including the "bilateral symmetrical" or irregular radiate forms of previous authors, such as Spatangus Viola, Orbildes, while the Zygopleura includes forms bilaterally symmetrical in the strictest sense, in which not more than two radial planes, and these at right angles to each other, are present. The stenometric ground-form is a half rhombic pyramid. Haeckel again divides these, according to the number of anteriors, into Tetrapleura and Diplura.

**Promorphology.**

Promorphology has thus shown that the reigning dogma of the fundamental difference of organic and mineral forms is false, and that a crystallography of organic forms is possible—the form of the cell or the cell-aggregate differing from the crystal merely by its more or less viscous state of aggregation, its inherited peculi-arity, and its greater adaptability to the environment. The classification into bilateral and radiate forms which usually does duty for more precise promorphological conceptions must be aban-doned as hopelessly confusing essentially different forms, or at least to be greatly modified. Moreover, the use of the term "double pyramids, the term bilateral to the Centropodea if not indeed to dipluran forms. Similarly the topographical and relative terms, anterior and posterior, upper and under, horizontal and vertical, must be superseded by the terms above applied to the axes and their poles, oral and aboral, dorsal and ventral, right and left.

**Nature of Morphological Changes.**—The main forms of organic structure being analysed and classified on the basis of homologie-ality being ascertained, the question next arises, by what morpho-logical changes have they arisen, and into what categories can these modes of differentiation be grouped? They at first sight seem innumerable, yet in reality are somewhat generalised for the flower as ascending and descending metamorphosis, expansion and contraction of organs, &c.; but the first attempt at careful enumeration seems to be that of Auguste de St Hilaire, who recognized defects of development, adherences, excesses of production or "dédoublements," metamorphosis and displacement of organs. Subsequent authors have variously treated the subject; thus A. Gray enumerates as modifications of the

**flower—coalescence, adnation, irregularity, abortion, non-alteration, etc., but the question is one of morphological changes, and has involved the study of the axis, and other morphological modifications consequent on fertilization. These are obviously too numerous, and may be best shown by a single comparison with the view of an animal--the Ostracoda, or "shell-fish." Thus the use of the term "shell," and the reduction of the same, is a natural one and a question of degree. It is a question of the suppression of certain parts, (c) coalescence of parts originally distinct. The particular form of excess of development which characterizes an organ will depend on the particular function of the organ and the changes due to partial or complete fusion of such repeated parts receive special treatment in the article METAMERISM.

**Nature of Morphological Correspondence—Categories of Homology.**—The ground-forms of the eight-sided amphitheatric pyramid may be roughly divided into two main categories, which may be called the categories of homology and analogy. The former is a result of the suppression of certain parts, (c) coalescence of parts originally distinct. The particular form of excess of development which characterizes an organ will depend on the particular function of the organ and the changes due to partial or complete fusion of such repeated parts receive special treatment in the article METAMERISM.

MORPH—MORRIS, GOVERNEUR

organisms, are nevertheless, as our historic survey showed, the first work of the morphologist is to determine the homological or homomorphic forms, as Haeeckel has shown, come to be referred to the general category of the promorphologist as do isoorganical crystals within that of his un-anorganical colleague the crystallographer. Here, too, would be considered the "homotypy of amictes," and all questions of symmetry, for which Haeeckel’s nomenclature of homaxonal, homopile, &c., is distinctly pruncated. Even in this field of tectology or morphology in the ordinary sense, we may not consider two organisms or plant embryos) differentiated and reared are the same category of individuality—i.e., homocategic; and under this serial homology, for instance, would come as a major division, the correspondence between the units or parts of units of a linear dyad-demic or triad. From a third point of view, that of the embryologist, we trace the development of such a multiple organism (1) from the embryonic layers and systems into which the protozoon (organism or plant embryo) differentiates; (2) from a unit-demic or unit of the inferior order or orders of individuality. The parts and units thus recognized by ontogenetic research, respectively or successively as homodermic, homostemic, and homodemic, may then conveniently be termed (indifferently save for considerations of priority) either "special homologous," "homogeneous," "homophilic," or "homogenetic," in the language of phylogenetic theory. These three great classes of morphological correspondence—morphomorphological, tectological and embryological—may or may not coincide. But the complete homology, in which all forms of resemblance unite and from which they differentiate, is that expressed in the embryonic theory itself. Neither is this embryonic theory which underlies it, and which Agassiz therefore not unjustly regarded as the greatest discovery in the natural sciences of modern times.

Orientation and Subdivisions of Morphology.—The position of morphology in the classification of the sciences and the proper mode of subdividing it cannot be discussed within these limits, although the position above assumed, that of including under morphology the whole statical aspects of the organic world, is that of Haeeckel, Spencer, Huxley and most recent animal morphologists; botanists, frequently, however, still use the term under its earlier and more limited significance (see Plants: Morphology).

(P. G. E.; P. C. M.)

MORPHY, PAUL CHARLES (1837–1884), American chess player, was born in New Orleans, Louisiana, on the 22nd of June 1837, the son of Allan Morphy (1798–1856) and his wife, whose maiden name was Le Carpentier. The father, the son of a well-to-do Spanish immigrant, was a prominent jurist and legislator and, like his brother Ernest, passionately fond of chess. Learning the moves from his father at the age of ten, Paul gave evidence of such extraordinary precocity that in less than two years he was able to defeat all the amateurs of his native city. While still at school he competed successfully with such strong players as Eugène Rousseau and the Hungarian master J. Löwenthal.

He attended the Jesuit college of St Joseph at Spring Hill, Alabama, and applied himself to the study of the law, being admitted to the bar of Louisiana in 1855. In the spring of 1857 he took part in the first American chess congress at New York, winning the first prize from sixteen competitors, including the well-known L. Paulsen. Morphy went to Europe in the spring of 1858 and entered upon a series of triumphs, both in regular matches and in blindfold play, that proved him to be one of the best players of the time. The winter of 1858–1859 was passed in Paris, where he was destined to gain his greatest triumphs, practically winning the championship of the world by beating Adolf Andersen, champion of Germany, by a score of 5 wins, 2 losses and 2 draws. At the same time he entered a remarkable blindfold match against eight strong French players, six of whom he defeated. At this time he was in his twenty-second year. Returning to the United States in 1859, he intended to establish himself in the practice of the law at New Orleans, but the outbreak of the Civil War frustrated these plans. His devotion to chess had already begun to affect his health. He spent the year 1860 in Paris, returning to New Orleans in 1864, but his health was now permanently impaired. He became insane, and at last he died in New Orleans in 1884.

See Exploits and Triumph of Paul Morphy, by F. M. Edge (New York: 1857); Morphy’s Games, edited by J. Löwenthal (New York: 1860); Paul Morphy, by Max Lange (Leipzig, 1881).

MORRILL, JUSTIN SMITH (1810–1898), American political leader and financier, was born at Strafford, Vermont, on the 14th of April 1810. He was a clerk in a store at Strafford in 1825–

1828, and at Portland, Maine, in 1828–1831, and was a merchant and then a farmer in his native town in 1831–1855. He was elected to the national house of representatives as an anti-slavery Whig in 1854, soon afterwards joining the new Republican party, and served in the house from 1855 until 1867. From 1867 until his death in Washington on the 28th of December 1868 he represented Vermont in the Senate. In the house he was a leader of the anti-slavery party, and in the Senate of the finance committee (of which he was chairman in 1865–1867), and of the Senate of the finance committee (of which he was chairman in 1858–1859, 1881–1883 and 1893–1898). Soon after entering Congress he became the acknowledged leader of the protectionists, and at the request of John Sherman, then chairman of the ways and means committee, he prepared a new tariff bill, which was introduced in the house in March 1860. To this relatively conservative bill, which substituted in many instances ad valorem for specific duties, and was intended by its author to be a revenue as well as a protective measure, were added many amendments which made the bill more strongly protectionist, and in some cases were vigorously opposed by Morrill. The bill was finally passed by the Senate on the 20th of February 1861, and was signed by President Buchanan on the 2nd of March following. Morrill is probably best known as the author of the Land Grant Act of 1862, which led to the development of the highly important system of state educational institutions, aided by the Federal government. On the 14th of December 1857, he introduced in the house a bill "donating public lands to the several states and Territories which may provide colleges for the benefit of agriculture and the mechanic arts." This bill passed both houses, but was vetoed in February 1859 by President Buchanan on the ground that it would create friction between the states, that it would be uneconomical, that it might encourage fraudulent speculation, that it would injure existing institutions, and that it was unconstitutional. A similar bill was introduced by Morrill on the 16th of December 1861, and five months afterwards was presented to the Senate by Benjamin Wade of Ohio. This bill, however, was rejected by the Senate; and it was strongly opposed in the Senate; but it passed both branches, and on the 2nd of July 1862 was signed by President Lincoln. This measure provided for the foundation and maintenance of colleges "where the leading object shall be, without excluding other scientific and classical studies, and including military tactics [which had not been included in the original bill], to teach such branches of learning as are related to agriculture and the mechanic arts . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." In 1866 Morrill introduced a new bill in the Senate called the "Second Morrill Act," under which $350,000 is given annually by the Federal government to each of the "land-grant" colleges.

MORRIS [MORRISON], CLARA (1849– ), American actress, was born in Toronto, Ontario, and at the age of seventeen joined a stock company in Cleveland, Ohio. Her first New York appearance (1870) was under August Daly in an adaptation of Wilkie Collins’s Man and Wife; and she won considerable success as Coral in L’Attore 47, Camille, Miss Multon and similar romantic parts. She had a difficult task at first, and soon afterwards began to write novels and to contribute to magazines. She published her Life on the Stage in 1901, and Life of a Star in 1906.

MORRIS, GOVERNEUR (1752–1816), American statesman, was born in the old Morrisania manor house, in what is now the city of New York, on the 31st of January 1752. He graduated at King’s College (now Columbia University) in 1768, studied law, and was admitted to the bar in 1771. New York, then in the midst of the political storm which preceded the outbreak of the War of American Independence, offered a good opportunity for a public career, and Morris had the aristocratic connections which tradition required.1 An extreme aristocrat

1 His great grandfather, Richard Morris, having fought in Cromwell’s armies, emigrated to America on the restoration of Charles II., and founded the manor of Morrisania, in what was then New Netherland. His grandfather, Lewis Morris (1671–1746), inherited this
in his political views, he distrusted the democratic tendencies of the Whigs, but a firm belief in the justice of the American cause led him to join their ranks. His half-brother, Staats Long Morris (1728-1800), was a Tory, fought in the British army, and became a major-General. Gouverneur served in the New York Provincial Congress in 1776-1777, was perhaps the leading advocate in that body of a declaration of independence, and after the Congress had become (July 1776) the "Convention of the Representatives of the state of New York," he served on the committee of that body which prepared the first draft of the state constitution. He served in the Continental Congress in 1777-1779, and was enthusiastic in his support of Washington. In 1778 he was selected chairman of the committee to treat with Lord North’s conciliation commissioners, and as such presented the famous report, adopted by a unanimous vote of Congress, which declared that the recognition of independence must precede any negotiations for peace. He settled in Philadelphia as a lawyer, and in February 1780 he published in Philadelphia a series of essays on finance, in which he criticized the issue of legal-tenders, denounced laws for the execution of such debts as common good. From 1781 to 1785 he was assistant to Robert Morris (q.v.), superintendent of finance. In 1782 he prepared a elaborate report on the coinage, suggesting the use of the decimal system and of the terms dollar and cent. With some modifications introduced by Jefferson, notably the adoption of a higher value of the dollar instead of one-tenth of a cent, this plan constitutes the basis of the present American system. Morris was one of Pennsylvania’s representatives in the constitutional convention of 1787, and took an active part in the debates. His influence was weakened, however, by his cynicism and by his ultra-aristocratic views. He favoured a strong executive holding during good behaviour, an aristocratic senate appointed by the president for life, and the restriction of the suffrage to free-holders. The struggle which the frontier settlers of Pennsylvania had made in the state legislature to secure unlimited issues of paper money and the enactment of laws favourable to the debtor class prejudiced him against the West, and he tried to introduce into the constitution a clause guaranteeing forever the political supremacy of the states east of the Alleghanies. He was opposed to the Federalists; he disliked the executive veto and in defeating the proposal that the legislature should elect the president. He also gave able support to the nationalistic and anti-slavery factions in the convention. He was a member of the committee of revision selected to draft the constitution in its final form, and that document is a monument to the vigour and simplicity of his literary style. In 1787 he bought Morrisania from Staats Long Morris, and returned to New York to live. He went to France in February 1789 on private business, and remained abroad for nine years, passing most of the time in Paris, London, and the German capitals. In 1792 he acted as financial agent in a daring attempt to secure the escape of the king and queen from Paris. He was appointed United States minister to France in 1792, and was the only representative of a foreign country who remained at his post throughout the Reign of Terror; but his ill-concealed attitude of hostility to the Revolution gave offence, and in return for the recall of Genet, at the request of the United States, the French government, in 1794, asked for the recall of Morris. Business and pleasure, however, still detained him in Europe for four years longer. He returned to New York in 1798, resumed the practice of his profession, re-entered politics, and sat in the United States Senate as a Federalist from 1800 to 1803. As early as 1801 Morris became interested in projects for improving the communication between the Hudson river and Lake Erie, and from 1810 to 1816 he was chairman of the board of canal commissioners, which after exploring the country prepared plans for the Erie Canal. He was bitterly opposed to the war of 1812, and openly advocated the formation of a northern confederacy to escape the rule of the “Virginia dynasty.” He died at Morrisania on the 6th of November 1816.

His half-brother, Lewis Morris (1726-1768), a signer of the Declaration of Independence, was educated at Yale, served in the Continental Congress from 1775 until early in 1777, and went on a mission to the western frontier in 1775 to win over the Indians for the British Association. He was awarded the Lyell medal by the Royal Geographical Society in 1786, and was made Hon. M.A. of Cambridge in 1878 in acknowledgment of his services as deputy Woodwardian professor during the final illness of Sedgwick. He died in London on the 7th of January 1886.

Morris, Sir Lewis (1833-1907), British poet, eldest son of Lewis Edward William Morris and Sophia, daughter of John Hughes of Carmarthen, was born at Penbryn in 1833. His great grandfather, Lewis Morris (1700-1765), had been a well-known Welsh poet and antiquary. He was educated at Sherborne School and Jesus College, Oxford, where he took first classes in classics (1853 and 1855). He won the chancellor’s prize for an English essay in 1858, was called to the bar in 1861, and elected fellow of his old college in 1877. He practised for twenty years as a conveyancing counsel, retiring from active legal work in 1881. He was energetic on behalf of educational movements in Wales, and contested Welsh constituencies in the Liberal interest, but without success. He was knighted in 1896, and became also a Jubilee-medallist and Knight of the Redeemer of Greece. Comparatively late in life Sir Lewis Morris made his appearance as a writer of verse with three series of miscellaneous poems, published respectively in 1872, 1874 and 1875. These little volumes proved him to have a refined taste and a gentle metrical fluidity, which soon won for his work considerable popularity. In 1876 and 1877 he made a more important venture with The Epic of Hades, an attempt to retell the stories of Hellenic mythology with a certain modern and allegorical setting. This work, though it is somewhat strained in sentiment and is not free from artistic infelicities, contains his best verse and has passages of undeniable force and effect. His later work follows too closely upon the influence of Tennyson, from which he is never altogether free; but his earnest
didacticism, genial optimism and evident sincerity have given his work a thoroughly wholesome moral influence. Among his other books were *Gwen (1880), Songs Unsung (1883), Cicely (1886), A Vision of Saints (1890), Idyls and Lyrics (1896) and The New Rambler* (1896). He died at Carmarthen on the 13th of May, 1907.

**MORRIS, RICHARD** (1833–1896), English philologist, was born in London on the 8th of September, 1833. In 1871 he was ordained in the Church of England, and from 1875–1885 was head master of the Royal Masonic Institution for Boys, near London. His first published work was *The Etymology of Local Names* (1857). Between 1862 and 1886 he prepared twelve volumes for the Early English Text Society, edited Chaucer (1856) and Spencer (1866) from the original manuscripts, and published *Specimens of Early English* (1867). His educational works, *Historical Outlines of English Accents* (1872), *Elementary Lessons in Historical English Grammar* (1874) and *English Grammar* (1874), had a large sale and exercised a real influence. The rest of his life he devoted to the study of Pali, on which he became a recognized authority. He died at Harold Wood, Essex, on the 12th of May, 1894.

**MORRIS, ROBERT** (1734–1806), American financier, a signor of the Declaration of Independence, was born in Liverpool, England, on the 31st of January, 1734. He emigrated to America in 1747, entered a mercantile house, and in 1754 became a member of the House of Representatives from 1781 to 1784. He retired from Congress in 1778, and was at once sent to the legislature, serving in 1778–1779 and in 1780–1781. His greatest public service was the financing of the War of Independence. As chairman or member of various committees he practically controlled the financial operations of Congress from 1776 to 1778, and when the board system was superseded in 1781 by single-headed executive departments he was chosen superintendent of finance. With the able co-operation of his assistant, Gouverneur Morris—who was in no way related to him—he filled this position with great success during the treacherous period of August. He was also agent of marine, and hence head of the navy department. Through requisitions on the states and loans from the French, and in large measure through money advanced out of his own pocket or borrowed on his private credit, he furnished the means to transfer Washington’s army from Dobbs Ferry to Yorktown (1781). In 1781 he established in Philadelphia the Bank of North America, chartered first by Congress and later by Pennsylvania, the oldest financial institution in the United States, and the first which had even partially a national character. A confusion of public and private accounts, due primarily to the fact that his own credit was superior to that of the United States, gave rise to charges of dishonesty, of which he was acquitted by a vote of Congress. He was a member of the Federal Convention of 1787, but took little part in its deliberations beyond making the speech which placed Washington in nomination for the presidency of the body. On the formation of the new government he was offered, but declined, the secretaryship of the treasury, and urged Hamilton’s appointment in his stead. As United States senator, 1789–1795, he supported the highest principles of a prosperous farm, which was known successively as the *Farm and Gilt*. **Hamilton** considerable assistance in carrying out his financial plans, taking part, according to tradition, in arranging a bargain by which certain Virginia representatives were induced to vote for the funding of the state debts in return for the location of the Federal capital on the Potomac. After the war he gradually disposed of his mercantile and banking interests and engaged extensively in western land speculation. At one time or another he owned wholly or in major part nearly the entire western half of New York state, two million acres in Georgia and about one million each in Pennsylvania, Virginia and South Carolina. The slow development of this property, the failure of a London bank in which he had funds invested, and the exertions of a Federal and the dishonesty of one of his partners, finally drove him into bankruptcy, and he was confined in a debtors’ prison for more than three years (1798–1801). He died in Philadelphia on the 7th of May, 1806.

The best biography is E. P. Oberholtzer’s *Robert Morris, Patriot and Financier* (New York, 1903), based upon the Robert Morris papers in the Library of Congress; see also W. G. Sumner’s *The Financier and the Finances of the American Revolution* (New York, 1891).

**MORRIS, WILLIAM** (1824–1866), English poet and artist, third child and eldest son of William Morris and Emma Shelton, was born at Elm House, Walthamstow, on the 24th of March, 1834. His grandfather was a respected tradesman in Worcester, and his father, who was born in that town in 1797, came up to London in 1820, and entered the office of a firm of discount brokers, in which he afterwards assumed a partnership. As a child the poet was delicate but studious. He learnt to read very early, and by the time he was four years old was familiar with most of the Waverley novels. When he was six the family moved to Woodford Hall, where new opportunities for an outdoor life brought the boy health and vigour. He rode about Epping Forest, sometimes in a toy suit of armour, became a close observer of animal nature, and was able to recognize any bird upon the wing. At the same time he continued to read whatever came in his way, and was particularly attracted by the stories in the *Arabian Nights* and by the designs in Gerard’s *Herbal*. He studied with his sisters’ governess until he was nine, when he was sent to a school at Walthamstow. In his ninth year his father died, leaving the family well off. The home at Woodford was broken up, as being unnecessarily large; and in 1848 William Morris went to Marlborough, where his father had bought him a nomination. Morris was at the school three years, but got very little good from it beyond a taste for architecture, fostered by the school library, and an attraction towards the Anglo-Catholic movement. He made but slow progress in school work, and at Christmas 1851 was removed and sent to a private tutor for a year. In June 1852 he matriculated at Exeter College, Oxford, but, as the college was full, he did not go into residence till January 1853. He at once made friends, who stood him in good stead all his life, foremost among whom were Edward Burne-Jones, who was a freshman of his year, and a little Birmingham group at Pembroke. They were known among themselves as the “Brotherhood”; they read together theology, ecclesiastical history, medieval poetry, and, among moderns, Tennyson and Ruskin. They studied art, and fostered the study in the long vacations by tours among the English churches and the Continental cathedrals. Moreover, Morris began at this time to write poetry, and many of his first pieces, afterwards destroyed, were held by sound judges to be equal to anything he ever did. Both Morris and Burne-Jones had come to Oxford with the intention of taking holy orders, but as they felt their way they both came to the conclusion that there was more to be done in the direction of social than of ecclesiastical work, and that their energies would be best employed outside the priesthood. So Morris decided to become an architect, and for the better propagation of the views of the new brotherhood a magazine was at the same time projected, which was to make a speciality of social articles, besides poems and short stories.

At the beginning of 1856 the two schemes came to a head together. Morris, having passed his finals in the preceding term, was entered as a pupil at the office of George Edmund Street, the well-known architect; and on New Year’s Day the first number of *The Oxford and Cambridge Magazine* appeared. The expenses of this very interesting venture were borne entirely
by Morris, but after the issue of No. 1 he resigned the formal editorship to his friend Fulford. Many distinguished compositions appeared in its pages, but it gradually languished, and was given up after a year's experiment. The chief immediate result was the friendship between Morris and Dante Gabriel Rossetti (q.v.), which sprang up from a successful attempt to secure Rossetti as a contributor. In the summer of 1856 Street removed to London, and Morris accompanied him, working very hard both in and out of office hours at architecture and painting. But Rossetti persuaded him that he was better suited for a painter, and after a while he devoted himself exclusively to that branch of art. It was in the summer that the two friends visited Oxford, and finding the new Union debating-hall in course of construction, offered to paint the bays. Seven artists volunteered help, and the work was hastily begun. Morris worked with feverish energy, and on finishing the portion assigned to him proceeded to work on the roof. The work did not do too soon and too fast, the colours began to fade at once, and are now barely decipherable; but the broken designs, so long as any vestige remains, will always be interesting as a relic of an important aesthetic movement and as the first attempt on Morris's part towards decorative art (see Rossetti). Early in 1858 Morris published The Defence of Guenevere, which was almost unnoticed by contemporary criticism, but is now recognized as one of the pearls of Victorian poetry.

On 26th April 1859 Morris married Jane Burden, a beautiful Oxford girl, who had sat to him as a model, and settled temporarily at 42 Red Lion Street, London, in a small house set apart for building for himself at Upton a house which was to be the embodiment of all his principles of decorative art. Furniture, decorations, household utensils and every article of daily use were specially designed, and in the summer of 1860 the house was ready for occupation. The furnishing of it had suggested a fresh activity; Morris now determined to embark upon decoration as a career. A small company was formed, consisting of D. G. Rossetti, Philip Webb, Burne-Jones, Madox Brown, Faulkner and Marshall, and in January 1862 started business under the title of Morris, Marshall, Faulkner & Co., with offices at 8 Red Lion Square. The prospectus set forth that the firm would undertake church decoration, carving, stained glass, metal-work, paper-hangings, chintzes and carpets. The business, after inevitable vicissitudes, flourished, but the "house beautiful" at Upton proved to be unhealthily situated. Serious illness obliged the family to remove to town, and in November 1865 they resided at 26 Queen Square, Bloomsbury. Morris was now unceasingly busy, but he found time also for literature. In June 1887 he published The Life and Death of Jason, which was at once successful, and in April 1868 he issued the first two parts of The Earthly Paradise. The result of this artistic enterprise, a number of poetic romance appeared in two volumes in 1869 and 1870. In the following year he was again looking for a country house, and lighted upon Kelmscott manor house, in the Upper Thames valley, which he took at first in joint-tenancy with Rossetti and used principally as a holiday home. In 1872 appeared Love is Enough, structurally the most elaborate of his poems for its combination of the epic and dramatic spirits; and in the autumn he began to translate the shorter Icelandic sagas, to which his enthusiasm had been directed by two inspiring journeys to Iceland. Business matters, however, interrupted him: it was found necessary to reconstruct the company owing to its having grown out of proportion with the existing division of profit and labour. Long negotiations ensued, and in March 1875 the old firm was dissolved. Morris now became sole manager and proprietor, although the other members of the old firm continued, in varying degrees, to give him the advantage of their assistance and advice.

Meanwhile the epic mood had possessed Morris very strongly, and, in addition to his work upon the sagas, he had actually finished and (in 1872) published a verse translation of the Aeneid, which is interesting rather for its individuality than for any fidelity to the spirit of the original. In the following year appeared Sigurd the Volsung, a version full of heroic vigour, movement and vitality, but somewhat too lengthy and incoherent in design to preserve the epic interest intact to the British taste. This splendid burst of poetic activity, however, had raised him to a place among the first poets of his time; and in 1877 an attempt was made to induce him to accept the professorship of poetry at Oxford. But he felt himself lacking in the academic spirit, and wisely declined. At this time a fresh outlet for his energy was furnished by his foundation in 1877 of the Society for the Protection of Ancient Buildings, which sprang into being as a practical protest against a scheme for restoring and reviving Tewkesbury Abbey. He began, too, to take an active interest in politics over the Eastern Question, but his enthusiasm was at the moment a flash in the pan. Finding that events were going against his judgment, Morris, as was so often the case with him, shrugged his shoulders and broke free from the movement.

Still, though he found it hard to sit close to a definite party, Morris continued to be spasmodically interested in political movements. During the next few years, indeed, the interest gained ground with him steadily. He became treasurer of the National Liberal League in 1879, but after the Irish coercive measures of 1881 he finally abandoned the Liberal party, and drifted further and further into Socialism. For ten or twelve years this movement had been gaining ground in England, and the Social Democratic Federation was formed in 1881. In January 1883, within a week of his election to an honorary fellowship at Exeter, Morris was enrolled among its members. Long before that time, his advocacy of the cause of Socialism absorbed not only his spare time, but the thought and energy of all his working hours. For it he even neglected literature and art. In March 1883 he gave an address at Manchester on "Art, Wealth and Riches"; in May he was elected upon the executive of the federation. In September he wrote the first of his Chants for Socialists. About the same time he shocked the authorities by pleading in University Hall for the wholesale support of Socialism among the undergraduates at Oxford. Nevertheless, the federation began to weaken. At the franchise meeting in Hyde Park in 1884 it was unable to get a hearing. Morris, however, had not yet lost heart. Internal dissensions in 1884 led to the foundation of the Socialist League, and in February 1885 a new organ, Commonweal, began to print Morris's splendid rallying-songs. Still, differences of opinion and degree prevented concerted action; and when, after the Trafalgar Square riots in February 1886, Morris demonstrated with the anarchic section he was denounced by the advanced party and ever afterwards was regarded with suspicion. In 1889 he was deposed from the management of Commonweal, and gradually lost all confidence in the movement as an active force. But for a time, however, Morris had returned to the paramount interests of his life—to art and literature. When his business was enlarged in 1881 by the establishment of a tapestry industry at Merton, in Surrey, Morris found yet another means for expressing the medievalism that inspired all his work, whether on paper or at the loom. In 1887 he published his translation of the Odyssey, which had many of the qualities and defects of his Aeneid, and is much more interesting as an experiment than valuable as a "Homeric echo." In the Commonweal appeared News from Newheare, published in book form in 1891, describing in England in which the principles of communism had been realized. He then added another to his many activities; he assumed a direct interest in typography. In the early seventies he had devoted much attention to the arts of illumination and calligraphy. He himself wrote several manuscripts, with illuminations of his own devising. From this to attempts to beautify the art of modern printing was but a short step. The House of the Wolfings, printed in 1889 at the Chiswick Press, was the first essay in this direction; and in the same year, in The Roots of the Mountains, he carried his theory a step further. Sometime perhaps, if later, he wished to print the printing press to his multiform interests, and started upon the first volume issued from the Kelmscott Press, his own Glittering Plain. For the last few years of his life this new interest remained the
MORRIS—MORRISON, R.

absorbing a. A series of exquisite books, which gain in value every year, witnesses to the thorough and whole-hearted fashion in which he invariably threw himself into the exigencies of his life-work.

The last years of his life were peacefully occupied. He was sounded as to whether he would accept the laureateship upon the death of Tennyson, but declined, feeling that his tastes and his record were too remote from the requirements of a court appointment. His last piece of work, the crowning glory of his printing-press, was the Kelmscott Chaucer, which had taken nearly two years to print, and fully five to plan and mature. It was finished in June 1896, and before it was in his hands he already knew it was doomed. It is an impression of all kinds—furniture, wall-papers and hangings (which he preferred to paper), carpet-weaving, and the painting of glass and tiles, needlework, tapestry—he formed a school which was dominated by his protest against commercialism and his assertion of the necessity for natural decoration and pure colour, produced by hand work and inspired by a passion for beauty irrespective of cheapness or quickness of manufacture (see ARTS AND CRAFTS).

The truest criticism of William Morris is that attributed to his friend, the poet Swinburne, who said that he was always more truly inspired by literature than by life. His Symphony, however, it made a brave show at times, was at heart a passionate enthusiasm for an inaccessible artistic ideal. Morris, indeed, was not primarily interested in men at all, but in objects. His poetry deals, it is true, with the human passions, but the emotion is always seen as in a picture; he is more concerned with the attitude of the group than with the realization of a character. He had very little adaptability in dealing with his fellows; the crowd, as a crowd, fired his enthusiasm, but he was unable to cope with the individuals that composed it. Many of his colleagues bear witness to his generosity and magnanimity. But as a general principle he certainly lacked the wider humanity. This is the falling of his art; it is also the shortcoming of his poetry. Granted this, there is left an immense amount that will always command admiration. The spirit of beauty breathes in every line; a sense of music and of colour is everywhere abundant; the reader moves, as it were, under a canopy of apple-blossom, over a flower-starred turf, to the faint harmony of virginals. Nor does the poet lack power and vigour when an adventurous story is to be told. The clash of arms breaks upon his pagan paradise with no uncertain sound; he is swift in narrative, breathless in escapade. And over all hangs the faint atmosphere of medievalism, of an England of green gardens and grey towers, of a London "small and white and clean," of chivalry and adventure in every brave. The critic has also to remember the historical value of Morris’s literary influence, following upon the prim domesticities of early Victorian verse, and breaking in upon Tennyson’s least happy phase of natural homeliness.

MORRIS, a city and the county-seat of Grundy county, Illinois, U.S.A., on the north bank of the Illinois river, about 62 m. S.W. of Chicago. Pop. (1900), 4773; (1910) 4563. Morris is served by the Chicago, Rock Island & Pacific railway, and by the Illinois & Michigan canal. Electric power is derived from the Illinois river at Marseilles, III. (pop. in 1910, 3291), about 15 m. west. Morris (named in honour of Isaac P. Morris, a commissioner of the Illinois & Michigan canal) was settled in 1834, and was chartered as a city in 1857.

MORRIS—DANCE, or MORRICE-DANCE (Span. Morisco, Moorish), an old English dance, which is said by various authorities to have been introduced by John of Gaunt from Spain about 1400, and from the French or Flemings. That it was a development of the morisco-dance or Spanish fandango is not invalidated by the fact that the morisco was for one person only, for, although latterly the morris-dance was represented by various characters, uniformity in this respect was not always observed. There are few references to it earlier than the reign of Henry VIII., but it would appear that in the reign of Henry VIII. it was an almost essential part of the principal village festivities. In earlier times it was usually danced by five men and a boy dressed in a leper habit, which was called Maid Marion. There were also two musicians; and, at least sometimes, one of the dancers, more gaily and richly dressed than the others, acted as "foreman of the morris." The garments of the dancers were ornamented with bells tuned to different notes so as to sound in harmony. Robin Hood, Friar Tuck and Little John were characters extraneous to the original dance, and were introduced when it came to be associated with the May-games. At Betchley, in Staffordshire, there is a painted window, of the time of Henry VIII. or earlier, portraying the morris—the characters including Maid Marion, Friar Tuck, the hobby-horse, the piper, the tabourer, the fool and five other persons apparently representing various ranks or callings. The hobby-horse, which, latterly at least, was one of the principal characters of the dance, consisted of a wooden figure attached to the person of the actor, who was covered with trappings reaching to the ground, so as to conceal his feet. The morris-dance was abolished along with the May-games and other festivities by the Puritans, and, although revived at the Restoration, the pageant gradually degenerated in character and declined in importance. Maid Marion was literally personated by a woman, while the Hobby-horse was played by a child. The interest of the subject has revived in recent years in connexion with the new movements associated with folk-music generally.

MORRISON, ARTHUR (1865— ), English novelist, was born in Kent on the 1st of November 1865. He was for a short time a clerk in the civil service, and in 1890 took to journalism. He had already published scattered tales and sketches of low life in London when W. E. Henley, with whom he was connected as a contributor to the National Observer, suggested their publication in volume form. Tales of Mean Streets (1894) immediately attracted attention, and this was followed by A Child of the Jago (1896), the scene of which is laid between High Street, Shoreditch, and Bethnal Green Road. Cuming Murrell (1900), The Hide in the Well (1902), and the detective stories, Martin Hewitt, Investigator (1894), which had sequels in 1895 and 1896, and The Green Eye of Gore, are among his other works.

MORRISON, RICHARD JAMES (1795—1874). English astrologer, commonly known by his pseudonym "Zadkiel," was born on the 17th of June 1795. He served in the Royal Navy, but resigned with the rank of lieutenant in 1829. He then devoted himself to the study of astrology, and in 1837 issued The Herald of Astrology, subsequently known as Zadkiel's Almanac. In this annual pamphlet Morrison, over the signature "Zadkiel Tao-Zee," published predictions of the chief events of the coming year. In 1863 Morrison brought a libel action against Admiral Sir Edward Belcher, who had accused him of obtaining money by charlatanism in the form of crystal-gazing. He was awarded twenty shillings damages, but was deprived of his costs. Morrison died on the 5th of April 1874.

MORRISON, ROBERT (1782—1834), the first Protestant missionary to China, was born of Scottish parents at Buller's Green, near Morpeth, on the 5th of January 1782. After receiving an elementary education in Newcastle, he was apprenticed to a lastmaker, but his spare hours were given to theology, and in 1803 he was received into the Independent Academy at
MORRISTOWN—MORSHANSK

Haxton. In the following year he offered his services to the London Missionary Society, and after he had attended David Bogue's college at Gosport and studied Chinese under a native teacher, he was appointed to Canton in 1827. After a year of much hardship he became translator to the East India Company's factory there in 1829, and worked at a Chinese Grammar and a translation of the New Testament, both published in 1844. In 1837 he published A View of China for Pæialogical Purposes, and his translation of the Old Testament (in which William Milne collaborated) was completed in the following year. His next enterprise was the establishment (1839) of an Anglo-Chinese college at Malacca for “the reciprocal cultivation of Chinese and European literature.” Here too were trained native Chinese evangelists who could proceed to the mainland and carry on Christian work with comparative immunity. In 1831 Morrison's Chinese Dictionary, in six 4to volumes, a monumental work, was published by the East India Company, at a cost of £15,000. Leaving China at the close of 1833, Morrison spent two years in England, where he was elected a fellow of the Royal Society. Returning to China in 1836, he set himself to promote education and to prepare a Chinese commentary on the Bible and other Christian literature. He died at Canton on the 1st of August 1834. Morrison was admirably fitted for the pioneering work accomplished by his grammar and dictionary; and his establishment of a dispensary, manned by a native who had learned the main principles of European treatment, marks him out as the forerunner of modern medical missions.

MORRISTOWN, a town and the county-seat of Morris county, New Jersey, U.S.A., on the Whippany river, 31 m. (by rail) W. of New York City. Pop. (1890) 8150; (1900) 11,267; (1910 census) 12,507. It is served by the Delaware, Lackawanna & Western, Lehigh & Hudson River, and the Morris & Erie railways. Morristown is situated on a table-land surrounded by picturesque hills. It is primarily a residential suburb of New York, and has many handsome residences and a number of large estates. Near its centre is a public park, in which is a soldiers' monument (50 ft. in height). At Morris Plains, about 4 m. to the north, is a state hospital for the insane (1876).

Morristown, officially named in 1740 in honour of Lewis Morris (1671-1740), then governor of New Jersey, and grandfather of Governor Morris, was settled about 1710, under the leadership of James Hanover, by Puritans, who were attracted here by the presence of iron ore. From January 3, 1777, and again from December 1779 to June 1780, Morristown was occupied by the American army under Washington. Behind the court-house is the site of Fort Nonsense, built at Washington's orders, largely to keep his soldiers employed. In December 1779-January 1780 General Benedict Arnold was tried before a court martial presided over by General Robert Howe (1732-1785) in the Dickerson tavern here, still standing. In Morristown, at the old Speedwell ironworks (almost destroyed by fire in 1900), was made a part of the machinery of the “Savannah,” the first steamship to successfully cross the Atlantic, and here Samuel F. B. Morse and Alfred Vail completed the invention of the electric telegraph. Morristown was incorporated as a town in 1815.

See A. M. Sherman, Historic Morristown, New Jersey; The Story of its First Century (Morristown, 1905) and Julia K. Colles, Authors and Writers Associated with Morristown (Morristown, 1893).

MORSE, SAMUEL FINLEY BREESE (1791-1872), American artist and inventor, was born at Charlestown, Massachusetts, on the 27th of April 1791, son of Jedidiah Morse (1761-1826), Congregational minister there and a writer on geography, and a grandson of Samuel Finley, president of the college of New Jersey. At the age of fourteen he entered Yale College, where he graduated in 1810 and where under the instruction of Jeremiah Day and Benjamin Silliman he received the first impulse towards electrical studies. In 1811 Morse, whose tastes during his early years led him more strongly towards art than towards science, became the pupil of Washington Allston, and accompanied his master to England, where he remained four years. His success at this period as a painter was considerable. In 1825 he was one of the founders of the National Academy of Design, and was its first president, from 1826 until 1845. The year 1827 marks the revival of Morse's interest in electricity. It was at that time that he learned from J. F. Dana of Columbia College the elementary facts of electromagnetism. As yet, however, he was devoted to his art, and in 1829 he again went to Europe to study the old masters.

The year of his return, 1832, may be said to close the period of his artistic and to open that of his scientific life. On board the packet-ship "Sully," while discussing one day with his fellow-passengers the properties of the electromagnet, he was led to remark: "If the presence of electricity can be made visible in any without the circuit, I see no reason why intelligence may not be transmitted by electricity." In a few weeks he had completed rough drafts of the necessary apparatus, which he displayed to his fellow-passengers.1 During the twelve years that followed Morse was engaged in a painful struggle to perfect his invention and secure for it a proper presentation to the public. In poverty he pursued his new enterprise, making his own models, moulds and castings, denying himself the common necessities of life. It was not until 1836 that he completed any apparatus that would work, and finally, on the 2nd of September 1837, the instrument was exhibited to a few friends in the building of the university of the City of New York. The instrument at the time had been set up, with such satisfactory results as to awaken the practical interest of the Messrs Vail, iron and brass workers in New Jersey, who thenceforth became associated with Morse in his undertaking. Morse's petition for a patent was soon followed by a petition to Congress for an appropriation to defray the expense of subjecting the telegraph to actual experiment over a length sufficient to establish its feasibility and demonstrate its value. The committee on commerce, to whom the petition was referred, reported favourably. Congress, however, adjourned without making an appropriation, and meanwhile Morse sailed for Europe to take out patents there. The trip was not a success. In England his application was refused, and, while he obtained a patent in France, it was subsequently appropriated by the French government without compensation to himself. His negotiations also with Russia proved futile, and after a year's absence he returned to New York. In 1843 Congress passed the long-delayed appropriation, steps were at once taken to construct a telegraph from Baltimore to Washington, and on the 24th of May 1844 it was used for the first time. In 1847 Morse was compelled to abandon his invention in the courts, and successfully vindicated his device by being called the original inventor of the electromagnetical recording telegraph. In 1858 the representatives of Austria, Belgium, France, the Netherlands, Piedmont, Russia, the Holy See, Sweden, Tuscany and Turkey appropriated the sum of 400,000 francs in recognition of the use of his instruments in those countries. He died on the 2nd of April 1872, at New York, where his statue in bronze now stands in the Central Park. (See Telegraph.) He introduced into America Daguerre's process of photography, patented a marble-cutting machine in 1825, and in 1842 made experiments with telegraphy by a submarine cable.

See S. Irenaeus Prime, Life of S. F. B. Morse (New York, 1875).

MORSE, the ornamented brooch by which a cock is fastened. The usual form is a large circular clasp made of gold or silver and studded with jewels. A 14th-century “morse” ornamented with translucent enamel is in the British Museum. The word comes through the O. Fr. mors, from the Lat. morsus, the catch of a buckle, from mordere, to bite.

MORSHANSK, a town of Russia, in the government of Tambov, 50 m. N. of the city of Tambov, on the Tsna river. Pop. (1900) 25,913. The village of Morsha was founded in the middle of

1 Five years later the captain of the ship identified under oath Morse's completed instrument with that which Morse had explained to board the "Sully" in 1832.
the 17th century, and received municipal institutions in 1779; but within a very few years it became a wealthy town, owing to its situation in a very fertile district. Since it was brought into railway communication with Ryazhsk (81 m. west on the railway between Moscow and Ryazan) it has become the chief centre for the trade in wheat raised in the governments of Tambov, Penza, Saratov and in the eastern districts of the government of Ryazan. There are also extensive dealings in flour, sugar, tobacco, and paper.

MORTAGNE—MORTAR

MORTAGNE, a town of northern France, capital of an arrondissement in the department of Orne, 24 m. E.N.E. of Alençon by rail. Pop. (1906), 3383. A vaulted entrance (15th century), relic of an old stronghold, and the church of Notre-Dame (15th and 16th centuries) with a fine northern portal are of interest.

The town is the seat of a sub-prefecture and of a tribunal of first instance, and is a celebrated market for horses of the Perche breed. Mortagne, once capital of the Perche, dates from the 10th century.

MORTAIN, a small town in the department of La Manche, France, the chief town of an arrondissement and seat of a sub-prefect. It is beautifully situated on a rocky hill rising above the gorge of the Cance, a tributary of the Sélune. The parish church of St Évroult is a magnificent example of the transitional style of the early 13th century, with a massive tower of the 14th and a Norman doorway dating from the original collegiate church (1053). Close to the town is the Abbey-Blanche, founded as a Benedictine convent in 1105 and soon afterwards affiliated to Cîteaux. The church is a perfect example of a Cluniac monastic church of the late 12th century, and portions of the 12th-century cloisters also survive. The population is between 2000 and 3000.

Mortain was, in the middle ages, the head of an important comté, reserved for the reigning house of Normandy. In or about 1049 Duke William took it from his cousin William, the "warling," and bestowed it on his half-brother, Robert, thenecoroh known as "count of Mortain," whose vast possessions in England after the Conquest (1066) gave name to "the small fees of Mortain," which owed less (knight) service to others. Robert was succeeded as count by his son William, who rebelled against Henry I., was captured at the battle of Tinchebrai (1066) and forfeited his possessions. Some years later, Henry bestowed the comté on his nephew Stephen, who became king in 1135. On Stephen's death (1154) his surviving son William became count of Mortain, but when he died childless in 1159 the comté was resumed by Henry II. On the accession of Richard I. (1189) he granted it to his brother John, who was thereupon known as count of Mortain till he ascended the throne (1199). With his loss of Normandy the comté was lost, but after the recapture of the province by the House of Lancaster, Edmund de Beaumont, a grandson of John of Gaunt, was created count of Mortain and so styled till 1441, when he was made earl of Dorset.

As the counts are often described as "earls" of Mortain (or even of "Moreton") the title is sometimes mistaken for an English one. It has also, through erroneous spelling, been sometimes wrongly derived from Mortagne-en-Perche. (J. H. R.)

MORTAR, the name (1) of a vessel in which any material may be crushed or pounded, and (2) given to various compositions used in building and consisting of lime and cement with sand or other fine aggregate, well mixed by manual labour or machinery, with a proper quantity of clean water (see below, and also Brickwork). The Latin name both for such a vessel and for the material as mixed in it, is mortarium. The earlier English form mortar, from Fr. mortier, has been in modern English more closely adapted to the spelling of the Latin original. As applied to a vessel, the name is chiefly used for one employed in the preparation of drugs, which are pounded or triturated in the "mortar" by means of a pestle (Lat. pustillum; pinseere, to pound). The name has also been given, from a resemblance in shape to the vessel, to a short thick piece of ordnance, resting on a "bed" formerly used for high-angle fire. The barrel was always very short, normally even shorter than it was wide, and sometimes even resembled a bowl in shape. The place of the mortar in artillery is now taken by the howitzer. In modern times the name "mortar" is occasionally used for a particularly short howitzer. (See Ordnance.)

Building Mortar.—The sand forming the aggregate is placed on the mixing platform and formed into a ring within which lime in the required proportion is placed; it is then gently but thoroughly sprinkled with clean water through the rose of a watering-can or hose. The mixture is then well worked with a shovel until well tempered. For large works a mortar mill working by hand, steam, or other power effects a considerable economy. Stone chippings, clean, hard, broken bricks or clinkers may also be used as a substitute for sand when it is employed, as the action of grinding reduces any large pieces to small sand-like particles.

The materials apply as ordinary lime mortar. Mortar of hydraulic lime, cement mortar, or mortar gauged with cement, must be mixed up in quantities sufficient only for immediate use. Any material not used at the time, or at least the same day, will be wasted; cement cannot be reworked after it has begun to set as its setting properties are destroyed.

Slaking is a most important part in the process of making mortar. There are three methods of slaking lime—first by immersion, then by sprinkling with water, and finally by exposing the lime to the air. Different qualities of lime require varying amounts of water, but the average allowance is a gallon and a half to every bushel of lime. It should all be added at once, and the mass then left to slake undisturbed. Hot limes are often used for mortars. These are unsuitable for plastering unless slaked for a long period, and will at once give off a great deal of water. Hot limes are used immediately after mixing, slaking must continue for a long time, drying up the moisture necessary for setting, and causing the mortar to crumble to dust in the joints of the brickwork. This fact gives us the reason for the old Roman enactment which stated that lime should be slaked for three years before using. In the south of Europe it is the custom to slake lime the season before it is used.

Combining the practical application of these methods proved the methods of patting the joints of brickwork and stonework, are described and fully illustrated in the article on Brickwork.

The results of many careful tests and experiments serve to show that the hardening of mortar is due to several causes acting conjunctively. With ordinary lime mortars the chief causes of hardening are the absorption of carbonic acid from the air and the combination of part of the water with the lime, which unites with some of the silica of which the sand is composed and forms silicate of lime. The initial setting is due to the evaporation of the excess of water and to the production of minute crystals of hydrate of lime. The slowest action is that of the chemical combination of a mortar of rich lime an outer crust is thus formed on the exposed parts which prevents ready access of air to the interior and retards setting. In illustration of this peculiar property of lime to remain plastic for a remarkable length of time, a mortar of 1 gallon was erected by Vauban in 1666 was removed by General Treissart, in 1822, a hundred and fifty-six years after erection. The lime in the interior of the mass of mortar was in this instance not exposed to the atmosphere, was found to be quite soft. Dr John of Berlin mentions that in removing a pillar 9 ft. in diameter in the church of St Peter, Berlin, eighty years after erection, the mortar in the interior was found to be quite soft. Sir C. W. Pailey, in removing the old wharf wall at Chatham dockyard in 1834, found that the work executed in lime mortar was easily removable, the mortar being in a state of pulp. The brickwork, built with Roman cement, was found necessary to blast.

The Romans were convinced that it was owing to prolonged and thorough slaking that their works in plaster became so hard and were not injured by cracking. L. B. Alberti mentions in his History of Masonry that he once discovered in an old trough some lime which had been left there five hundred years and that it was quite soft and fit for use.

The setting and hardening of hydraulic limes and cements are due to chemical combination. The slaking of lime is instantaneous, but not by mere absorption of carbonic acid gas from the atmosphere. As a consequence we find that this variety of limes and cements has the valuable property of setting hard while immersed in water and in many cases growing increasingly hard with the lapse of time.

Opinions differ very widely as to the question of suitability for building purposes of lime or cements containing a high percentage of magnesium, many experts holding the view that the expansion which often occurs in floors and other slabs is not a serious evil and can be partially or wholly attributed to the presence of this substance. For mortars, however, it may be assumed that the presence of magnesia is not detrimental to the value of the matrix, but on the contrary may be a source of strength, for experiments show that it reduces the energy of
slaking and increases that of the setting processes. Cements containing magnesia are pronounced both by Vicat and Chatenoy to resist the dissolving action of sea-water better than those in which no magnesia is present, and it is pretty well established by experience that cements derived from argillo-magnesian limestones furnish a durable setting in the sea. 

The old mortar of the Romans, which proves its great property of endurance by many of their works still remaining, was in all probability composed of the mixture with pozzolana in England. These materials are similar in character and are obtained from extinct volcanoes—in the case of the Romans from the Italian volcanoes, but also from extinct volcanoes in the valleys of the Rhine and in Holland. Good as these mortars under water were, it may be safely asserted that no cement or mortar has been discovered to excel in strength, or in durability in all climates, the Portland cement of the present day. The best varieties of this material are published in England and it is probably the use of cement with lime passed from India to Egypt and Rome. The following is an extract from the Roorkie Treatise on Engineering, a work published in 1840: "It is common in this country, to mix a small quantity of the coarsest sand or gravel with the powder of ‘jagery’ being mixed with each gallon of water. The bricks were left for thirteen hours and after that time the average breaking weight of the joints in twenty trials was 6 lb per square inch. In twenty-one specimens joined with the same mortar without the ‘jagery’ the breaking weight was 4 lb per square inch."

Of the saccharine matters used in mortar ‘trass’ seems to give the best results, rough cane sugar being next in effectiveness; beetroot sugar is not a good material to use.

The by-laws made by the London County Council in 1891 under sec. 16 of the Metropolitan Management and Buildings Regulation Act 1875 require that "the mortar to be used in the construction of walls must be composed of freshly burned lime and clean, sharp sand or grit, without earth, matter, or other saccharine matter, in the proportions of one of lime to three of sand or grit. The cement to be used must be Portland cement or other cement of equal quality to be approved by the district surveyor, mixed with clean, sharp sand or grit in proportions of one of cement to four of sand or grit. Burnt ballast or broken brick may be substituted for sand or grit, provided such material be properly mixed with lime in a mortar mill."

The varieties of lime and a cement chiefly used for mortar in the British Isles are set forth below:

- Pure or fat limes should not be used for mortar. Grey stone lime, feebly hydraulic, makes a good mortar, but should not be employed for wet below ground or in other damp situations.

- Limes and Cements for Mortar. Portland cement is obtained chiefly at Dorking, Halling, Lewes and Merstham. It is used in the proportion of one part to two or three parts of sand. An analysis of the lime from Castle Blytham gives the following composition:

  - Silica: 14-00
  - Iron oxide and alumina: 4-25
  - Lime: 77-00
  - Magnesia: 4-25
  - Carbon dioxide: 0-90
  - Water and loss: 2-60

Blue clays lime is eminently hydraulic and should be used in good class work. Its use is a necessity for foundations and work in damp situations where Portland cement is not employed. It is used in the proportion of one part to two or three parts of sand. The best known varieties are obtained from Watchet in Somersetshire, Barrow-on-Soar in Leicestershire, Rugby in Warwickshire, and Wyke Regis in Dorsetshire. A typical flax lime shows on analysis the following composition:

  - Silica: 17-53
  - Iron oxide: 2-87
  - Alumina: 6-83
  - Magnesia: 6-84
  - Carbon dioxide: 1-36
  - Water and carbon dioxide: 3-85
  - Insoluble matter and loss: 0-72

Portland cement is the best matrix known, since it is the most powerful and the most durable. It is used for mortar wherever great strength, hardness, wearing properties, and resistance to water are required. It should weigh 112 lb per struck bushel and be ground fine enough to pass through a sieve having 2500 meshes to the square inch and leave not more than 10% residue. Test briquettes after setting for seven days in water should be examined for work that is to be subsequently painted. The mortar for the brick facing of the Forth Bridge below water was composed of one part of Portland cement and one part of sand mixed with water in a mill. Briquettes made from this compound when dried a tensile stress of an average of 365 lb per square inch when a week old, and of 510 lb at five weeks after mixing. Salt has no effect upon the strength of a mortar, although it retards the setting process somewhat. Cement mixed with a percentage of sugar (usually 2% and under) has been used with varying success. In India sugar is a frequent ingredient in mortars, because it has the effect of preventing too rapid setting; it also retards the dissolving action of the material. The sugar must be dissolved in the water used for gauging, as the results obtained when the sugar is mixed with the sand and cement in a dry state are not good. The addition of sugar to water enables it to take up about fourteen times more lime than pure water. It is supposed by many writers who have studied the methods of the ancients that old Roman mortars contained strong alkali or other saccharine matter, and it is probable that the use of sugar with lime passed from India to Egypt and Rome.

**MORTARA, E.—MORTGAGE**

Mortara, an Italian Jew, of a Bologna family, whose abduction in early childhood (1858) by the Inquisition occupied for several years the attention of European diplomacy. Edgar Mortara, when between five and six years of age, fell ill. His nurse, a Catholic, arranged with her priest for his baptism in that faith, unknown to his parents, on the 24th of June 1858. She had acted in the same way with another boy, who had been ill a year or two previously, but on his recovery the boy continued to be educated as a Jew. This time she determined to make sure of her convert. Everything was concerted in advance with the ecclesiastical authorities, and immediately after the baptism both child and nurse disappeared. The story became public property, and protest was aroused in nearly every European country. The English and French governments made representations to the Vatican, but Pius IX., through the medium of the *Città Cattolica,* maintained that the situation at issue was a spiritual one, outside his temporal jurisdiction. He accordingly declined to take any action, meanwhile indicating the direction of his sympathies by making Mortara his ward. In 1861 the Mortara family induced the Italian government to demand the prosecution of the nurse. The Vatican replied that she had entered a nursery, and subsequently, on the threat of intervention by Prussia, induced the Mortara family to withdraw their plaint. After the capture of Rome by the Italian troops in 1870 Edgar Mortara had the opportunity of reverting to Judaism, but he refused to do so, and not long afterwards became an Augustinian.

**MORTARA,** a town of Lombardy, Italy, in the province of Pavia, 354 ft. above sea-level, a railway junction situated between the Ticino and the Po, 32 m. by rail S.W. of Milan. Pop. (1901), 7208 (town); 8607 (commune). Lines run to Milan, Pavia, Alessandria, Casale Monferrato and Vercelli. The church of San Lorenzo is in the Gothic style of the 14th century with a brick façade. Outside the town is the Lombard Romanesque church of S. Albino. Mortara has iron-works and manufactures of hats and cheese. Here the Austrians defeated the Piedmontese in 1849.

**MORTGAGE** (an old French legal word, meaning "dead pledge," translated in medieval Latin *mortuum solum*), 1 the securing "money or money's worth" by making it a charge upon property, real or personal, so that if the debt be not paid by a time agreed upon by the parties, the creditor may foreclose or sell the property and pay himself out of the proceeds. In English law this is done by an actual or executory conveyance of the property to the creditor, subject only to its being defeated if the debt should be paid at the time fixed—an arrangement to which the law has attached peculiar incidents designed to carry out its real object.

The history of mortgage transactions in Roman law shows three well-marked stages. In the beginning the estate was conveyed absolutely to the creditor, who made a covenant (*fiducia*) to reconvey it when the debt should be paid. All the interest, however, in the meantime passed from the debtor to the creditor, and should the latter refuse to reconvey there was no remedy to the original owner except a personal action. In the second stage (that of *pignus*) the property did not pass to the creditor; he merely received possession of the thing pledged, together with certain rights of sale, &c., in the event of payment not being made at the time appointed. Lastly, without parting with the possession even of the pledge the debtor could create a lien or charge (*hypothecla*) over it in favour of the creditor, who

1 *Coke on Littleton* gives the following explanation of the meaning: "It seemeth that the cause why it is called mortgage is, for that it is doubtful whether the lessee or lessor shall pay at the day limited such summe or not, and thereby, the lessee is enabled, which is a certain condition for the payment of the money is taken from him for ever, and so dead to him upon condition, &c. And if he doth pay the money, then the pledge is dead as to the tenant, &c."
of the court of thancery, will turn the scale when there is an equality of equitable rights between two contracting parties. Thus, if the third mortgagee had no notice at the time of making his advance of the existence of the second mortgagee, the equities of the two claimants are supposed to be equal, and if nothing else intervened priority of time would decide the order of their rights. But if the third mortgagee gets an assignment of the first mortgage, he can tack his third mortgage to the first, and so postpone the second mortgagee. And if the first mortgagor himself makes an additional advance after the date of the second mortgage, but without notice of it, his whole debt will take precedence of the second mortgage. A similar result of equitable rules is seen in the consolidation of securities. Two separate estates, mortgaged at different dates, in the same sums of money by the same mortgagor to the same mortgagee, are regarded as consolidated, so that the whole of the land becomes security for the whole of the money, and the owner cannot redeem either mortgage without redeeming the other. If the mortgagor should have mortgaged another estate for more than its value, the holder of the deficient security may buy in the first mortgage, consolidate it with his own, and exclude the second mortgagee.

An equitable mortgage is constituted simply by the deposit of the title-deed of the land or money advanced. The enactment of the Statute of Frauds that no action shall be brought on “any contract or sale of lands,” etc., or any interests in or concerning them unless the agreement be in writing and signed by the party to be charged, has been cited as incompatible with the recognition of equitable mortgages, but it is argued by Lord Abinger that the act was never meant to affect such a transaction. The deeds which are the evidence of title could not be recovered in an action at law, and, if they were claimed in equity, the court would require the claimant to do equity by repaying the money borrowed on the deposit. Any subsequent legal mortgagee, having notice of the deposit, will be postponed to the equitable mortgagee, and when the legal mortgagee has not inquired as to the title-deeds the court will impute to him such knowledge as he would have acquired if he had made inquiry. A Welsh mortgage is one in which an estate is conveyed to a creditor, who takes the rents and profits in lieu of interest and without account, the estate being redeemable at any time on payment of the principal. Any form of property, with few exceptions, may be mortgaged.

The United States has been express legislation dealing with mortgages of land in most of the states. For the most part legislation has followed the lines of the English law, but there is a great variation in the extent to which the principles of equity have been substituted for the rules of common law. In some states, the mortgage deed is held to create a seizin of and an estate in the premises, with all its common law incidents, to be enforced if need be by ejectment. In others, the mortgagee’s rights are limited to such as the rules of equity prescribe, and may not be enforced by a suit at law. In yet others, the mortgagee’s interest is not deemed an estate at all, but is here only to be enforced by the sale of the premises as a means of paying the debt. See Fisher on Mortgages; Coote on Mortgages; Ashburn on Mortgages; L. A. Jones, Treatise on the Law of Corporate Bonds and Mortgages (Indianapolis, 1897).

MORTIER, ÉDOUARD ADOLPHE CASIMIR JOSEPH, DUKE OF TREVISO (1768-1833), marshall of France, was born at Cateau Cambresis on the 13th of February 1768, and entered the army as a sub-lieutenant in 1791. He served in the campaigns of 1792, 1793 on the northern frontier and in the Netherlands, and subsequently on the Meuse and the Rhine. In the war against the second coalition in 1796 he was promoted successively general of brigade and general of division. His conduct of the French occupation of Hanover led Napoleon to include Mortier in the first list of marshals created in 1804. He commanded a corps of the grande armée in the Ulm campaign in which he distinguished himself particularly by his brilliant action of Dürenstein; in 1806 he was again in Hanover and north-western Germany, and in 1807 he served with the grande armée in the Friedland campaign. In 1808 he was created duke of Treviso, and shortly afterwards he commanded an army corps in Napoleon’s campaign for the recapture of Madrid, and he remained in Spain for two campaigns, winning the victory of Ocaña in November 1809. In 1812 and 1813 he commanded the Young Guard, and in the “defensive” campaign of 1814 he rendered brilliant services in command of rearguards and covering detachments. In 1815, after the flight of Louis XVIII, he rejoined Napoleon and was given a high command, but at the opening of the Waterloo campaign he fell ill. After the second restoration he was for a time in disgrace, but in 1819 he was readmitted to the Chamber of Peers and in 1825 received the pension of the grand cross of the Order of St. Louis. In 1834-1835 minister of war and president of the council of ministers. In 1835, while accompanying Louis Philippe to a review, the marshal with eleven other persons was killed by the bomb aimed at the King by Fieschi (July 28, 1835).

MORTIFICATION, a term used in pathology and surgery, signifying a local death (Lat. mortæ) in the animal body. A portion of the body may die in consequence of the disturbance of its nutrition by inflammation, or of a cutting off of the blood-supply by pressure, or of other accidents. A comparatively slight injury affecting a portion of the body imperfectly supplied with blood may give rise to an inflammatory condition which in a healthy part might pass unnoticed, but which, in consequence of imperfect nutrition, may end in mortification. If the flow of arterial blood only is arrested, the part depending upon it for nutrition becomes numb, cold and shrivelled, and the form of mortification known as dry gangrene occurs. This is apt to be met with in oldish persons with diseased vessels and feeble heart-action, especially if the blood is rendered less nutritious by the presence of diabetes or of kidney disease. The rule of treatment in all cases of threatened mortification is to keep the part warm by flannel or cotton-wool, but to avoid all methods which unduly hurry the returning circulation. Such increase would give rise to excessive reaction, which, in tissues already weakened, might actually produce mortification. When the part is dead it should be wrapped up in dry antiseptic dressings to prevent putrefaction. The surgeon should then wait until the “line of demarcation,” a linear ulceration, between the living and the dead part is evident, and then, if the case permits, should amputate at a higher level. In dry gangrene no attempts should be made to save the part, in which no line of demarcation forms, the best chance for the patient is promptly to amputate high up in sound tissues. In these cases the blood is generally poisoned, and if the patient recovers from the primary shock of the operation, the disease may reappear in the stump, and lead to a fatal result. Frost-bite.—Under the influence of cold, the blood-vessels contract, and less blood is conveyed to the tissues. Frost-bite is particularly apt to attack the feet, the hands, and the tips of the ears. The condition is unassociated with pain, for the reason that the nerves are numbed. As no blood is passing into the skin, the parts look like tallow, and thus attract the attention of the companions of the frost-bitten man, who perhaps has no thought of there being anything amiss. But because the tissues are frost-bitten it does not follow that they will not recover. The great danger is that, as the blood in the vessels becomes thawed, there will be so much reactionary flow through the tissues that acute inflammation will follow. And this inflammation of the damaged tissues is very likely to cause mortification. The re-establishment of the circulation, therefore, should be undertaken with the greatest possible care. The frost-bitten individual must not be brought near a fire nor even into a warm room. Nothing warm should come in contact with the affected parts. The best thing to do is to rub them with snow or with cold water. The thawing is associated with much pain, and in the case of the hand or foot this may be diminished by raising the part, so as to help the return of the venous blood to the heart. If mortification follows, the parts
MORTILLET—MORTIMER

879

become black, and care should be taken to prevent their becoming invaded by the germs of putrefaction.

(E. O.)

MORTILLET, LOUIS LAURENT GABRIEL DE (1821-1898), French anthropologist, was born at Meylas, Isère, on the 29th of August 1821. He was educated at the Jesuit college of Chambéry and at the Paris Conservatoire. Becoming in 1847 proprietor of La Revue indépendante, he was implicated in the Revolution of 1848 and sentenced to two years' imprisonment. He fled the country and during the next fifteen years lived abroad, chiefly in Italy. In 1858 he turned his attention to ethnological research, making a special study of the dwellings of the Swiss. He returned to Paris in 1864, and soon afterwards was appointed curator of the museum at St. Germain. He became mayor of the town, and in 1885 he was elected deputy for Seine-et-Oise. He had meantime founded a review, Matériaux pour l'histoire positive et philosophique de l'homme, and in conjunction with Broca assisted to found the French School of Anthropology. He died at St Germain-en-Laye on the 25th of September 1898. Of his published works the best known are Le Présidiat (1862); Origines de la pêche, de l'agriculture (1890); Les Nègres et la civilisation égyptienne (1884).

MORTIMER (Family). The Mortimers of Wigmore, earls of March and Ulster, were of a stock akin to the dukes of Normandy and to many great houses of the duchy. Their ancestor Hugh, bishop of Coutances in 990, had as least three sons by a niece of Herfast the Dane, forefather of the Norman earls of Hereford, and brother-in-law of Duke richard I. the eldest of these sons was Ralph, father of William of Warenne, earl of Surrey; the other was Roger, Mortimer-en-Briai, in the Pays de Caux, who, like his elder brother, is called filius episcopi. If we assume that Roger was born before his father's consecration, he must have lived to a great age. In the battle fought within his own village of Mortemer, Roger was a leader of the force which defeated the French, but, releasing an enemy of his, he was punished by the loss of his castle, which was given to his nephew, William of Warenne. The chronicle of Ordericus Vitalis makes the Conqueror relate in a long deathbed speech how he had thrust Roger out of Normandy, and, though reconciled to him, had not restored the castle "in which he served my enemy." It is somewhat remarkable that the Mortimers, thus early deprived of the castle at the source of the Eaulne, yet handed down a surname derived from it. Here also it may be noted that although Mortimer and Warenne branch off from their common stock before the beginnings of armorial bearings, the two houses assumed arms, which speak plainly enough of their common origin. The Mortimers' chief seat in Normandy became St Victor-en-Caux, where in 1074, by the last recorded act of Roger and his wife Hawise, the priory became an abbey. Roger's age would have forbidden him to be with the duke at Hastings, but, according to Wace, his son Hugh was in the fight, and Ralph the third son was probably among the knights.

By the deaths of his elder brothers, Ralph de Mortemer became heir to his father's lands. He followed his kinsman, William Fitz-Osbern, the earl of Hereford, to the marches of Wales, and the Domeday book for Hereford and Shropshire marks the growth of the Mortimer power in those counties. He remained loyal during the rising of the 2nd earl of Hereford, and was enriched by grants of many of the earl's forfeited estates, among them the castle town of Wigmore, which became the chivalric seat of Mortimer and Cleobury, thereafter called Cleobury Mortimer. His Domeday lands lie in eleven counties, but the most important are found in North Hereford and South Shropshire. Although keeping apart from the treason of Earl Roger, Ralph rose in 1188 with the other barons of the March, but was reconciled to William II., whom he afterwards supported in Normandy. He was living in 1194 a partisan of Henry I., and must have died soon afterwards. Hugh de Mortimer, who is found as his successor, a great Herefordshire baron in 1240, may have been either the son of Ralph's old age, or a grandson, the son of another Ralph. During the reign of Stephen, Hugh occupied himself with local feuds, but seized the royal castle of Bridgnorth. So great was his power in the marches, that he alone, deserted by the king, made war on Henry II. and held his three castles against Henry II. Although forced at last to submit, he was allowed to keep Wigmore and the ruins of Cleobury. This proud baron died at Cleobury (c. 1181) in the habit of a monk which he had founded at Wigmore.

Ralph de Mortimer, the 5th baron of Wigmore (d. 1246), married Gwladys the Swart, daughter of Llewelyn the Great, of Llywarch's famous race, the princes of Wales, and by her was father of Roger, whose bride, Maude de Breuse, daughter and co-heir of that William de Breuse whom Llewelyn had hanged, brought with the lady of Breuse of Brecknock, and a share of the honour of Breuse of Brecknock, and a share of the earl's marshal. So came the lordship of Radnor with other lands, and, as Eton justly remarks, the history of the Mortimers ceases to be a provincial record. The last-named Roger stood steadfast for the Crown during Henry III's struggle with his barons. He found the fleet horse that carried Edward from his captivity. He led the rear-guard at Evesham, where his marchers hacked the head from earl Simon, and sent it to their lady at Wigmore. "After that victory," says Eton, "no privilege, reward or honour was too great for Mortimer to ask." Dying in 1282, he was succeeded by Edmund, the eldest surviving son (d. 1304), Roger, a third son, founding the line of Mortimer of Chirk.

By Margaret de Fiennes, a kinswoman of Queen Eleanor of Castile, Edmund Mortimer had, with other issue, a son and heir, Roger (b. 1287), whose great-inheritance was increased on his marriage with Joan, daughter and heir of Peter de Geneville, his grandmother being a co-heir of Lacy. The whole of the Geneville lands, with the half of the Lady fief in England and Ireland, came through her to the Mortimers, who now added the castle town of Ludlow and half Meath to their estates. As the king's lieutenant in Ireland during Edward Bruce's invasion of 1316, Roger Mortimer defeated the Lacy's, his wife's jealous kinsfolk, and made her inheritance secure. With the aid of his uncle Roger Mortimer of Chirk, he assured the Mortimer power on the Welsh marches. During the war with the Despensers, the force of the Mortimers was cast against the king and his favourites, but after Bridgnorth Castle had been taken and fired, uncle and nephew submitted and suffered a harsh captivity for two years in the Tower of London. The uncle died in his prison, whence the nephew made a famous escape to France. At the court of Charles IV. the exile met Isabel, the queen of England, and early in 1326 the scandal of her close friendship with the lord of Wigmore had reached England. When the queen and her mercenaries from Germany and Hainault landed at an English port in September, Mortimer was with her, and he followed the flight of the king to Wales. He was among the judges of the elder Despenser at Bristol, and of the younger, his chief enemy, at Hereford. After the parliament had deprived Edward II. and made the young Edward king in his stead, Roger, as the queen's paramour, ruled England. Enriched by the lands of the Despensers, and by those of the earl of Arundel, beheaded at his command, Mortimer, who was created earl of March in 1328, never ceased to add greedily to his possessions and offices. When he held a Round Table, he summoned to it, with the young king and the queen-mother, almost all the nobles of the kingdom, and was, says Robert of Avesbury, "in the midst of them all." But his fate followed suddenly upon these doings. Lancaster turned in vain upon the aggrandized march-lord, but the young king, impatient of his own puppet-like place in Mortimer's polity, worked secretly and surely for his fall. Montague's men-at-arms entered Nottingham Castle by night, and joining the king, seized the favourite in his chamber next the queen. Mortimer, with the courage of his race, turned to bay and struck dead a knight who was the king's steward. But he was hurried to London and condemned by the peers; his death followed suddenly. Like any foot-pad, he was drawn at the horse-tail to the elbows of Tyburn, where his body hung two days upon the common gallows.
MORTISE—MORTON, EARL OF

The earl's son and heir, Edmund Mortimer, had been married to Elizabeth of Badlesmere, heir of her brother Giles. He died the year after his father's fall, and his young son Roger, as he grew up, was restored to a great part of their forfeited inheritance. This Roger fought at Crecy in "the king's battle." A founder of the order of the Garter, he was summoned as a baron and obtained a reversal of his grandfather's attainder. In 1355 he was summoned as earl of March. On the death of his grandmother, Ludlow Castle became the chief seat of his house. But following his king in the invasion of Burgundy, he died suddenly at Rouvray in 1360. His wife, a grand-daughter of that William Montague, earl of Salisbury, who had captured his grandfather at Nottingham, survived him two-and-twenty years.

His only son, Edmund, a boy nine years old, succeeded him as 3rd earl of Mortimer (1355-1381). A bride was found for him in the Cecile house. His marriage with Philippa, daughter of Lionel of Antwerp, duke of Clarence, by Elizabeth de Burgh, the heir of Ulster, added the earldom of Ulster to his style, and brought his issue into the direct succession of the crown. Like so many of his race, he died young, of a chill caught in fording a Munster river on a winter's day, and his countess was dead before him. Elizabeth, their eldest child, became the wife of the famous Harry Percy, called Hotspur. Their second son was Roger, who succeeded to his father's two earldoms as a boy of seven, and was at once appointed lieutenant of Ireland. His marriage was given to the earl of Kent, who married him to his daughter, Eleanor Holand, the niece of King Richard. In the parliament of 1385 the king named him as heir-presumptive to the throne. The panegyrist of his family are loud in their praise of his knightly doings and his great beauty, but they speak also of his lion-like ferocity, of his lasciviousness, and of his neglect of divine things. When in Ireland he defied the statute of Kilkenny, and ordered his garments and horse-harness after the fashion of an Irish chieftain. He wore the Irish mantle on his back, in the manner, in one of the Leinster wars, in the Leinster men, he was struck down at Kells as he charged far before his horsemen. The body, mangled by Irish spears and axes, was brought home to be laid by his fathers in their abbey of Wigmore.

Once more a child succeeded to the earldoms. Edmund, 4th earl of March, was six years old at his father's death, and was, for the king's party, the heir-presumptive of the kingdom. But in 1399 the boy's fate was changed by the coming to power of the Lancastrian party, and Henry IV.'s first parliament recognized Henry's son as heir-apparent. Although Edmund and his brother Roger were brought up honourably with the new king's younger children, they were in strict custody until the king's death, broken only by the attempt of their uncle, Sir Edmund Mortimer, and his father-in-law, Owen Glyndwr, to carry them off from Windsor to Wales, where the young earl would have been proclaimed king. Henry V., however, released the earl and restored his lands, and absolved March from any share in the plot of the earl of Cambridge, who had married Anne, sister of the earl. March served the king in his French wars, although a dysentery caught in the camp at Harfleur seems to have kept him from his share in the glory of Agincourt. On the accession of Henry VI. the earl was appointed to the lieutenancy of Ireland which had been held by his father and grandfather, and in Ireland, on the 19th of January 1425, he died suddenly of the plague. His wife, Anne, daughter of Edmund, earl of Stafford, had borne him no child, and thus, his brother being dead before him, the illustrious house of the Mortimers, earls of March and Ulster, became extinct. Their lands and earldoms passed to Richard, duke of York, son of Richard of Gloucester, by the last marriage of the great name of Mortimer disappeared from the English barony.

O. B.A.

MORTISE, or mortice (adapted from the Fr. mortaise; cf. Ital. mortise and Spanish mortaja; the origin is unknown; Celtic equivalents, such as Gaelic moirit, are of French origin), a term for a socket or cavity cut in a piece of wood, or other material, into which a corresponding projecting end, a "tenon," fits, the two when fitted together forming a "mortise-joint," for fastening two beams or other pieces of timber together.

MORTLAKE, a village in the Kingston parliamentary division of Surrey, England, on the Thames, 6½ m. W. of London. Pop. of parish, which includes East Sheen (1901), 7774. It has been associated with the Oxford and Cambridge boat-race since 1845, the race finishing here. The village appears in Domesday, and the manor belonged to the Archbishops of Canterbury until the time of Henry VIII., when it passed by exchange to the Crown. From the early part of the 17th century until after the Civil Wars Mortlake was celebrated for a manufacture of tapestry.

MORTMAIN (O. Fr. mortemain; med. Lat. mortua manus, dead hand), the state or condition of lands or tenements when held by a corporation in perpetual or inalienable tenure. Alienation in mortmain having the effect of depriving the lord of the incidents of seignory, which arose through the death or felony of the tenant or failure of his heirs, many English statutes were passed directly against such alienation. The earliest is that of Henry III. 36 (Magna Carta); others being 7 Edward I. 13 (1275), 6 Edward II. 6 (1326), 1 Edward III. 4 (1332), 14 Edward III. 19 (1349), 13 Richard II. 18 (1385), 1 Henry VI. 22 (1426), and 3 Henry VIII. 19. The present law is regulated by the Mortmain and Charitable Uses Act 1888, as amended by the act of 1891.

MORTON, JAMES DOUGLAS, 4TH EARL OF (c. 1525-1581), Scottish statesman, was the second son of Sir George Douglas of Pittendrie. Before 1543 he married Elizabeth (d. 1574), daughter of James Douglas, 3rd earl of Morton, a grandson of James Douglas (d. c. 1500), who was created earl of Morton in 1548. The 3rd earl's wife was Catherine, an illegitimate daughter of James IV. In 1553 James Douglas succeeded to the title and estates of his father-in-law, and in 1563 he became lord high chancellor of Scotland. Though he repudiated the reforms, he took no part in the composition of Protestant barons in 1565, but he headed the armed force which took possession of Holyrood palace in March 1566 to effect the assassination of Rizzio, and it was to his house that the leading conspirators adjourned while a messenger was sent to obtain Mary's signature to the "bond of security," the queen, before complying with the request, escaped to Dunbar, and Morton and the other leaders fled to England. Having been pardoned, Morton returned to Scotland early in 1567, and was created Marquis of Lothian. He was appointed governor of the queen after her marriage with Bothwell had taken refuge. He was present at the remarkable conference at Carberry Hill, and he also took an active part in obtaining the consent of the queen at Lochleven to an abdication. He led the army which defeated the queen's forces at Langside in 1568, and he was the most valued counsellor of the earl of Murray during the latter's brief term of office as regent. On the death of the earl of Mar (Oct. 28, 1572), Morton, who had been the most powerful noble during this regency, and also during that of the earl of Lennox, at last reached the object of his ambition by being elected regent. In many respects Morton was an energetic and capable ruler. He effected at Perth, in February 1573, with the aid of Elizabeth's envoy, a pacification with Huntly, the Hamiltons, and the Catholic nobles who supported Mary. Only the castle of Edinburgh held out, and this, aided by English artillery, he succeeded in taking after a brave resistance by Kirkcaldy of Grange and Maitland of Lethington.

The ensuing execution of these men, the bravest and the ablest Scotsmen of that age, put an end to the last chance of Mary's restoration by native support. But while all seemed to favour Morton, there were under-currents which combined to procure his fall. The Presbyterian clergy were alienated by his leaning to Episcopacy, and all parties in the divided Church by his seizure of its estates. Andrew Melville, who had succeeded to the leadership of Knox, was more decided than Knox against any departure from the Presbyterian model, and refused to be

won by a place in his household. The powerful earl of Argyll and Atholl, a Stuart and Roman Catholic, united with Alexander Erskine, a younger son of the Erskine family of the young king, and others in a league which received so much support that Morton bent before the storm and offered to resign. He surrendered the castle of Edinburgh, the palace of Holyrood, and the royal treasures, retiring to Leickeven, where he busied himself in laying out gardens. But his ambition could not deny itself another stroke for power. Aided by the young earl of Mar, he got possession of Stirling Castle and the person of the king. Civil war was avoided only by the influence of Sir Robert Bowes, the English ambassador. A nominal reconciliation was effected, but Stirling had caused a new government. Morton, who secured an indemnity, was president of the council, but Atholl remained a privy councillor in an enlarged council with the representatives of both parties. Shortly afterwards Atholl died of poison, it was said, and suspicion pointed to Morton. His return to power was brief, and the only important event was the prosecution of the two Hamiltons, who still supported Mary and saved their lives by flight to England. The final fall of Morton came from an opposite quarter. In September 1579 Edmée Stuart, the king's cousin, came to Scotland. Morton had entrusted the government to a council of his friends, and the estates and earldom of Lennox, the custody of Dumbarton Castle, and the office of chamberlain. One of his dependants, Captain James Stuart, son of Lord Ochiltrie and brother-in-law of Knox, had the daring to accuse Morton at a meeting of the council in Holyrood in complicity in the murder of Darnley, and he was at once committed to custody. Some months later Morton was condemned by an assize for having taken part in that crime, and the verdict was justified by his confession that Bothwell had revealed to him the design, although he denied participation in its execution. Morton was executed by the maiden—a guillotine he had himself brought from England—on the 2nd of June 1581.

The attainted earldom of Morton passed by charter at his death to a grandson of the 3rd earl, John, 7th Lord Maxwell (1553–1593), who had previously claimed the title. In 1586, however, the attainder was rescinded in favour of Archibald Douglas, 8th earl of Angus (g.c.), a nephew of the 4th earl. Various earls of Morton have now to be distinguished.

Sir William Douglas (d. 1606), who ranks as 6th or 7th earl of Morton, was the 4th earl's near kinsman, being the son of Sir Robert Douglas of Lochleven (d. 1547), and was closely associated with him in his career, the two men being occasionally confused in the histories. He had a son, Archibald Douglas, 9th earl of Morton (d. 1615), but his younger son, Sir Robert Douglas (d. 1633), who was attainted in 1616, succeeded to the earldom. The 4th earl's will will succeeded in 1588 to the earldom of Morton, on the death of Archibald, 8th earl of Angus; but Lord Maxwell's title of Morton, which had been revoked in 1585, was revived in 1588. Archibald was at first taken for a man of Morton's faction, and was only afterwards executed by the maiden—a guillotine he had himself brought from England—on the 2nd of June 1581.

MORTON, L. P.—MORTUARY

dramatist, was the author of Columbus, or a World Discovered (1792); Speed the Plough (1798); The School of Reform, or How to Rule a Husband (1805); A Roland for an Oliver (1819); and other pieces.

MORTON, LEVI PARSONS (1824— ), American banker and politician, was born at Shoreham, Vermont, on the 16th of May 1824. He was in business at Hanover, New Hampshire, in 1834–1849 and in Boston in 1840–1854. He then became a partner in a New York dry-goods house. He established in 1863 the banking house of L. P. Morton & Company (dissolved 1899), with a London branch which had Sir John Rose (1820–1888) as its principal member. The American firm assisted in funding the national debt at the time of the resumption of specie payments, and the London house were fiscal agents of the United States government in 1873–1884, even as such received the $15,500,000 awarded by the Geneva Arbitration Court in settlement of the “Alabama Claims” against Great Britain. In 1899 Morton became president of the Morton Trust Company in New York City. He was a Republican representative in Congress in 1879–1881, United States minister to France in 1881–1885, vice-president of the United States during the presidency of Benjamin Harrison in 1889–1893, and in 1895–1896 was governor of New York, signing as such the “Great New York” bill and the liquor-tax measure known as the “Raines law.” In 1896 he was a candidate for the presidential nomination in the Republican national convention.

MORTON, OLIVER PERRY (1823–1877), American political leader, “war governor” of Indiana, was born in Salisbury, Wayne county, Indiana, on the 4th of August 1823. After studying for two years (1843–1845) at Miami University, he practised law at Centerville, Indiana, and in 1852 was judge of the sixth judicial circuit of Indiana. In February 1856 he was a member of the Pittsburg convention which led to the organization of the national Republican party, and in the same year he was a candidate for governor of Indiana; he also assisted his campaign with a considerable part of the organization of the new party in his state. He was elected lieutenant-governor in 1856, and when Henry S. Lane (1811–1881), the governor, resigned, on the 16th of January 1861, Morton became governor. In 1864 he was re-elected. In meeting all the extraordinary demands resulting from the Civil War he displayed great energy and resourcefulness, and was active in thwarting the schemes of the secessionists in the neighbouring state of Kentucky, and of the Knights of the Golden Circle, the Order of American Knights, and the Sons of Liberty (secret societies of Southern sympathizers and other opponents of the war) in Indiana. In 1861 a hostile legislature sought to deprive him of all control over the militia, and failing in this, adjourned without making the appropriations necessary for carrying on the state government. In this predicament Morton appointed a bureau of finance, and appealed for financial aid to private individuals, bankers, the counties, and even the Federal government. The response was so prompt that he was able to conduct affairs practically single-handed until 1865, when a legislature more favourable to his policies assembled. In 1865, when Morton had a paralytic stroke and went to Europe for treatment, the president entrusted him with a confidential mission to Napoleon III. concerning the withdrawal of the French troops from Mexico. Morton resigned as governor in January 1867 to accept a seat in the United States Senate, in which he served during the rest of his life. He was recognized as one of the leaders of the Radical wing of his party, voting in favour of Johnson’s impeachment, and being especially active on behalf of negro suffrage. In 1870 Grant offered to appoint him minister to Great Britain, but he declined the honour on perceiving that a Democrat would succeed him in the Senate.

He was a candidate for the Republican nomination for the presidency in 1876, and at the national convention of his party received 124 votes on the first ballot; the nomination, however, finally went to Rutherford B. Hayes. He died at Indianapolis on the 4th of November, 1877.

MORTON, THOMAS (1564–1599), English bishop, was born at York, and was educated at York and Halifax grammar schools and St John’s College, Cambridge, where he became fellow on taking his degree. He was ordained in 1592, and held the office of university lecturer in logic till in 1598 he was presented to the living of Long Marston, Yorkshire. He gained a considerable reputation as a Protestant controversialist, and published numerous works against Roman Catholicism, chief among them being the Apologia catholica (1652) and A Catholike Apology (1660). He held successively the deaneries of Gloucester (1660), Winchester (1660), and a canonry at York (1610). In 1616 he became bishop of Chester, in 1618 bishop of Lichfield and Coventry, and in 1632 bishop of Durham. On the abolition of the episcopate in 1646 he was assigned a pension, but it was never paid, and the remainder of his life was passed in retirement.

MORTON, THOMAS (c. 1590–1646), usually called Thomas Morton, or Merrymount, English adventurer in America, was a lawyer of Clifford’s Inn, London, and seems to have practised in the west of England. He spent three months in America in 1622; returned in 1625, and settled at Mount Wollaston, in what is now Quincy, Massachusetts; and in 1626, when most of the settlers removed to Virginia, he assumed command of the settlement, and renamed it Merrymount. Morton, a Royalist rake, soon became a thorn in the flesh of the sober colonists at Plymouth. On May-Day in 1627 his companions erected a May-pole, and, assisted by Indians, indulged in all the revelry and licence then customary in England. "The setting up of this pole" says it, "was withal a mean act, and not the best that lived at New Plutoose."

"They termed it an Idol; yea, they called it the Calf of Horeb, and stood at defiance with the place, ... threatening to make it a woeful mount and not a merry mount."

In disregard of a royal proclamation, Morton sold rum and fire-arms to the natives, not only injuring the trade of Plymouth, but also endangering the safety of the colonists. Morton was therefore arrested and sent to England; and when John Endecott, with a patent from the council for New England, arrived soon afterward he visited the Mount which lay within his jurisdiction, rebuked the inhabitants, cut down the May-pole, and renamed the place Mount Dagon. In 1630 Morton returned to America, but was arrested on trivial charges by the Massachusetts authorities, and was confined in the stocks. Later his house was burned and he was sent to England, where he spent a term in the Essex gaol. After his release he wrote his New English Canaan (1637), in which he describes the Indians and the natural features of the country, and heaps ridicule upon the New England colonists. In 1643 Morton returned to America. He was imprisoned in Boston in the following year, and was tried before the general court for complaining against the colony before the Privy Council; he was re-committed to gaol pending the gathering of further evidence, and after a year’s confinement was fined £100 and released. He retired to Agamentics (now York), Maine, and in 1646 died poverty-stricken.

See the New English Canaan, edited by Charles Francis Adams (Publications of the Prince Society, vol. ix., Boston, 1883); C. F. Adams, Three Epistles of Massachusetts History (Boston, 1866); and, for a more favourable view of Morton, A Few Observations on the Prince Society’s Edition of the New English Canaan, revised and reprinted from the Churchman (New York, 1895).

Morton’s adventures have furnished material for Nathaniel Hawthorne’s short story, The Maypole of Merrymount, and for John Lothrop Motley’s novels, Morton’s Hope (1839) and Merry Mount (1849).

MORTUARY (Med. Lat. moriarius, from moriātur, dead), of or belonging to the dead, or, in particular, to the burial
of the dead. The chief modern use of the word is for a building in which dead bodies awaiting burial may be temporarily kept, for the purpose of inquiry, identification, post-mortem examination, &c. But it has also been applied to many subjects connected with death and burial. In monastic institutions it was the duty of the almoner to send round to other monastic houses notice of the death of a member, asking for prayers for the soul of the dead. This notice was often beautifully illuminated. On being returned with the endorsement of the monastery to which it had been sent, it would be copied into the roll. Both the notice and the roll were known as a mortuary, or mortuary (see Abbob F. H. Gasquet's English Monastic Life, 1904). In the English Church a "mortuary" was in certain places a customary oblation or offering paid out of the estate of a deceased person to the church to which he belonged. An act of 1529 (21 Hen. VIII. c. 6) limited the amount to be paid in mortuaries, the highest being of the value of 10s. in estates above £40. Mortuaries, where customary, can only be enforced in the ecclesiastical courts. The custom has entirely died out, though claims have been made from time to time.

MORVAN, a region forming the northern continuation of the central plateau of France, and extending over a large part of the department of Nièvre, and over portions of those of Yonne, Côte-d'Or and Saône-et-Loire. Its area is a little over 1000 sq. m. The average elevation is about 1600 ft., the culminating point the Bois-du-Roi, attaining 2950 ft. It is traversed by the Yonne, which has its source on Mt Prénelay (2785 ft.), by the Cure and by several affluents of the Arroux. Geologically it consists chiefly of gneiss and granite. It contains much good pasturage and is abundantly wooded, the exploitation of its forests affording employment to large numbers of the inhabitants.

MORVI, a native state of India, in Kathiawar, within the Gujarat division of Bombay. Area, 822 sq. m.; pop. (1901), 87,496, showing a decrease of 17% in the decade, due to famine; estimated revenue, £48,000; tribute, £4,000. The chief, whose title is Thakur sahib, is a Jadeja rajput, of the same clan as the rao of Cutch. The chief products are cotton and grain. The town of Morvi is situated on the river Machhu, 22 m. from the sea and 33 from Rajkot; pop. (1901) 17,520.

MORVILE, Hugh de, one of the four English knights who perpetrated the murder of Becket. He appears in the service of Henry II. from 1158. His principal estate was at Burgh-on-Sands. After the archbishop's murder Hugh and his associates at first took refuge in Knaresborough Castle; afterwards the king sent them to obtain absolution from the pope. The story runs that all four were enjoined to go on pilgrimage to the Holy Land, but it is not known whether Hugh made his expulsion in this way. The date of his death is unknown, but it was in or before 1202/3, when we find his English lands in the hands of his two daughters as co-heiresses.

See Eyton's Itinerary of Henry II.; Ramsay, Angevin England.

MORSON, Fynes (1566-1630), English traveller and writer, was the son of a Lincolnshire gentleman, Thomas Morson, member of parliament for Grimsby. After being educated at Cambridge, where he gained a fellowship at Peterhouse, Fynes Morson spent many years in travel on the continent of Europe, in Palestine, and in Asia Minor. In 1600 he became secretary to Sir Charles Blount, lord-deputy of Ireland, in which country his brother, Sir Richard Morson, held an important government appointment. In 1617 Morson embarked on an account of his travels and of his experiences in Ireland, where he witnessed O'Neill's rebellion, in a voluminous work entitled An Itinerary. He died on the 12th of February 1630. The Itinerary was originally intended to consist of five parts; but only three were printed, a fourth being preserved in manuscript in the library of Corpus Christi College, Oxford (partially printed in 1903 in Charles Hughes's Shakespeare's Europe). Another part of the Itinerary was republished in 1735 with the title History of Ireland 1599-1603, with a short Narrative of the State of the Kingdom from 1169; and in 1890 Henry Morley included in the "Carisbrooke Library" a volume, Ireland under Elizabeth and James I., described by Spencer, Sir John Davies and Fynes Morson. The Itinerary is a work of great value to the historian as a truthful picture of the social conditions prevailing in Europe at the beginning of the 17th century.

MOSAIC (corresponding to Lat. opus musitum, from Gr. μουσίτων, an artificial grotto often decorated with mosaics; the word is only found in the sense of mosaic in late Greek, which generally uses ψφοδόλγυμα), the fitting together of many, generally small, pieces of marble, opaquc glass, coloured clays, or other substances, so as to form a pattern.

Ancient Mosaic.---The earliest existing specimens of mosaic belong to one of the less important branches of the art,—namely, the ornamentation on a small scale of jewellery, ivory thrones, and other furniture, or more rarely of some elaborate architectural ornament. Most of this sort of mosaic resembles in execution what are called cloisonné enamels. In the Louvre and in the British Museum are preserved some very beautiful ivory carvings in low relief, some from Nineveh and others from Egypt, in which figures of deities, ornaments formed of the lotus flower, and other plant designs are either set by small pieces of glass or lapis-lazuli and other gem-like stones, which are let into holes made in the ivory. Each minute piece is separated from the next by a thin wall or cloison of ivory, about as thick as cardboard, which thus forms a white outline and sets off the brilliance of the coloured stones.

Excavations at Tel-el-Yehudia in Lower Egypt have brought to light some mosaics on a larger scale, but treated in the same way. These are caps of columns, wall tiles, and other objects, either of white limestone or earthenware, in which designs, chiefly some forms of the papyrus, are formed by bits of glass or enamelled earthenware, let into a sinking in the tile or column. This form of mosaic was employed by the Greeks: the Erechtheum at Athens, built in the middle of the 5th century B.C., had the bases of some of its white marble columns ornamented with a plait-like design, in which pieces of coloured glass were inserted to emphasize the main lines of the pattern.

Another, quite different, sort of mosaic was known to the Egyptians of the Ptolemaic and Roman periods. This is made entirely of glass and is extremely minute. The finest known specimen is in the British Museum: it is a small tablet about 3 in. square, apparently the bezel of a ring, on which is represented the sacred hawk—every feather on the bird's wing being produced with a great number of colours and tints, each quite distinct, and so minute that a strong magnifying glass is required to distinguish its details.

The way in which this mosaic was produced is extremely ingenious. Numbers of long sticks of various-coloured glass were arranged in such a way that their ends produced the figure of the hawk; other sticks of blue glass were placed all round so as to form the ground. The whole bundle of sticks of glass when looked at endwise now presented the figure of the hawk with a blue background, immensely larger than it afterwards became. The bundle was then heated till the sticks melted together, and the whole thick rod, softened by fire, was drawn out to a greatly diminished thickness. A slice of the rod was then cut off and its faces polished—the design, much reduced in size, of course being equally visible at both sides of the slice; and thus the microscopic minuteness of the mosaic was produced with astonishing delicacy and refinement; many slices, each showing the same mosaic, could be cut from the piece of glass.

Far more important was the use of mosaic on a large scale, either for pavements or for walls and vaulted ceilings. We are told by Pliny (H. N. xxxvi. 184) that the practice of decorating pavements "after the fashion of painting" was due to the Greeks, and there is no reason to doubt the truth of this statement, although no mosaic pavement discovered in Greece can be dated with certainty to a period preceding the Roman occupation. This is true even of the pavement in the temple of Zeus at Olympia (fig. 1; Olympia, Baedekermüller, vol. ii. pl. cv.).
The simplest classification of mosaics is that of Gauckler (Daremberg and Saglio, Dictionnaire des antiquités, s.v. "Musivum Opus"), who distinguishes the following:

a. Opus tessellatum, consisting of cubes of marble or stone, regularly disposed in simple patterns. This was largely used for pavements, especially in Roman times.

b. Opus verniculatum, consisting of cubes (not always regularly shaped) generally of coloured marble or more precious materials, when these were obtainable, disposed so as to obtain a pictorial effect. The art of mosaic is mainly concerned with this branch of work.

c. Opus opacum, properly applied to the mosaic decoration of walls and vaulted ceilings (camerae), in which cubes of glass or enamel were used. The glass was rendered opaque by the addition of oxide of tin, and coloured with other metallic oxides; when melted it was cast into flat slabs, generally about 1 in. thick, and then broken into small cubes.

d. Opus sectile, a species of marqueterie in marble or other coloured materials used to produce pictures and patterns. Under the later empire a particular variety of this, called opus alexandrinum, mainly composed of porphyry, red and green, was much in use.

Judging from the description given by Vitruvius (vii. 1), and an examination of numerous specimens of Roman tessellated mosaics, the process of manufacture was the following. The earth was first carefully rammed down to a firm and even surface; on this was laid a thick bed of stones, dry rubbish, and lime, called "rudus," from 6 to 9 in. deep, and above this another layer, 4 to 6 in. thick, called "nucleus," of one part of lime to three of pounded brick, mixed with water; on this, while still soft, the pattern could be sketched out with a wooden or metal point, and the tesserae or small bits of marble stuck into it, with their smoothest side uppermost. Lime, pounded white marble, and water were then mixed to the consistency of cream, forming a very hard-setting cement, called marmoratum. This cement, while fluid, was poured over the marble surface, and well brushed into all the interstices between the tesserae. When the concrete and cement were both set, the surface of the pavement was rubbed down and polished.

The usual Roman pavement was made of pieces of marble, averaging from half to a quarter of an inch square, but rather irregular in shape. A few other, but quite exceptional, kinds of mosaic pavements have been found, such as that at the Isola Farnese, 9 m. from Rome, made of tile-like slabs of green glass, and a fine "sectile" pavement on the Palatine Hill, made of various-shaped pieces of glass, in black, white, and deep yellow. In some cases—for example, in the "House of the Faun" at Pompeii—glass tesserae in small quantities have been mixed with the marble ones, for the sake of greater brilliance of colour.

Few countries are richer than England in remains of Roman mosaics; the great pavements of York, Woodchester, Cirencester, and many other places are as elaborate in design and as skilfully executed as any that now exist even in Rome itself. In whatever country these mosaics are found, their style and method of treatment are always much the same; the materials only of which the tesserae are made vary according to the stone or marble supplied by each country. In England, for instance, limestone or chalk often takes the place of the white marble so common in Italian and North African mosaics; while, instead of red marble, a fine sort of burnt clay or red sandstone is generally used; other makeshifts had to be resorted to, and many of the Romano-British mosaics are made entirely without marble. It is perhaps partly owing to the great wealth of Northern Africa in marbles of many colours and of varying shades that the finest of all Roman mosaics have been found in Algeria and Tunis, especially those from Carthage, some of which have been brought to the British Museum. See Archaeologia, xxxviii. 202.

The range of colour in the marble tesserae is very great, and is made use of with wonderful taste and skill: there are three or four different shades of red, and an equal number of yellows and greens, the last colour in all its tints being almost peculiar to this part of Africa, and one of the most pleasant and harmonious in almost any combination. Deep black, browns and bluish-greys are also abundant. The mosaics from Carthage are no less excellent in design than in the richness and beauty of their materials. Large spaces are filled by grand sweeping curves of acanthus and other leaves, drawn with wonderful boldness and freedom of hand, and varied with great wealth of invention. Without the use of very small tesserae, much richness of effect is given by gradations of tints, suggesting light and
MOSAIC

885

shade, without a painful attempt to represent actual relief. The colours of the marbles used here and elsewhere by the Romans are so quiet and harmonious that it would have been almost impossible to produce with them a harsh or glaring design. But when used with the skill and strong artistic feeling of the mosaic workers at Carthage the result is a real masterpiece of decorative design.

The finest of the later examples in Rome is that which decorates the vault of the ambulatory of the circular church of S. Costanza, begun by Constantine the Great, outside the walls of Rome. This very interesting mosaic might from its style and materials have been executed in the 1st century, and is equal in beauty to any work of the kind in Italy. It shows no trace whatever of the Byzantine influence which, in the next centuries, introduced into Italy a new style of mosaic, in materials of the most glittering splendour. Survivals of this classical style of mosaic are found in North Africa and the East. In Galia Placidia near Autun, Roman deposit, the ruins of a small three-apsed Christian church of the 4th century A.D. a fine mosaic pavement, covering the nave and aisles, thoroughly classical in style. A very similar mosaic, of about the same date, was discovered at Nehi Yunos, near Sidon.

Medieval Mosaics.—These may be divided into four principal classes: (1) those used to decorate walls and vaults, made of glass cubes; (2) those for pavements, made of marble, partly in large shaped pieces, and partly in small tesserae; (3) glass in small pieces, either rectangular or triangular, used to enrich marble pulpits, columns, and other architectural features; (4) wood mosaics.

1. In the Byzantine period the glass cube mosaic was exclusively employed in mural decoration. At first natural colouring was used, and backgrounds, if not in local colour, were generally blue, but the use of gold, both for backgrounds and for the highlights on drapery, etc., gradually prevailed. Owing to the intense conservatism of Byzantine art, no regular stages of progression can be traced in this class of mosaic. Some of the 5th-century mosaics at Ravenna are, in every way, as fine as those of the 12th, and it was not till the end of the 13th century that any important change in style took place. The mosaics of the 9th century are inferior in drawing and general treatment to those both of the earlier and later time, while in Italy at least this art was almost entirely extinct during the 10th and 11th centuries. Extreme splendour of colour and jewel-like brilliance combined with the most stately grandeur of form are the main characteristics of this sort of decoration.

A "majesty," or colossal central figure of Christ with saints standing on each side, is the most frequent motive. In many cases, especially in the 5th and 6th centuries, Christ was represented as the Judge, while the twelve apostles, in the form of sheep, are paying adoration. Christ, the Good Shepherd, is sometimes depicted as a beardless youth, seated among a circle of sheep—the treatment of the motive being obviously taken from Pagan representations of Orpheus playing to the beasts. The tomb of Gala Placidia has a good example of this subject, with much of the old Roman grace in the drawing and composition. Frequently the Virgin Mary, or the patron saint of the church, occupies the central space in the apse, with ranges of other saints on each side.

The "Doom," or Last Judgment, is a favourite subject for domes and sanctuary arches; the Florence baptistery has one of the grandest mosaic pictures of this subject, executed in the 13th century. The earlier baptisteries usually have the scene of Christ's baptism—the river Jordan being sometimes personified in a very classical manner, as an old man with flowing beard, holding an urn from which a stream of water forth. S. Vitale at Ravenna has in the sanctuary a very interesting representation of Justinian and his empress Theodora (see fig. 3), attended by a numerous suite of courtiers and ladies; these mosaics are certainly of the 6th century, and may be contemporaneous with Justinian, though the fact that he and Theodora are each represented with a circular nimbus appears to indicate that they were not then alive.

In mosaics of the best periods the treatment of the forms and draperies is broad and simple, a just amount of relief being expressed by delicate gradations of tints. In mosaics of the 9th century the drawing is very awkward, and the folds of the robes are rudely expressed in outline, with no suggestion of light and shade.

A further application of this work was to the decoration of broad bands over the columns of the nave, as at S. Maria Maggiore in Rome, 4th century, and in the two churches of S. Apollinare at Ravenna, 6th century. In some cases almost the whole interior of the church was encrusted in this magnificent way, as at Monreale Cathedral, the Capella Palatina of Palermo, and S. Mark's at Venice.

In these churches the mosaics cover soffits and angles entirely, and give the effect of a mass of solid gold and colour producing the utmost conceivable splendour of decoration. In many cases vaulted ceilings were covered with these mosaics, as the tomb of Gallo Placidia, A.D. 450, and the two baptisteries at Ravenna, 5th and 6th centuries. For exteriors, the large use of mosaic was usually confined to the west façade, as at S. Miniato, Florence; S. Maria Maggiore, Rome; and S. Mark's.

Venice. In almost all cases the figures are represented on a gold ground, and gold is freely used in the dresses and ornaments—rich jewels and embroidery being represented in gold, silver, sparkling reds, blues and other colours, so as to give the utmost splendour of effect to the figures and their drapery.

The revival of the art of painting in Italy and the introduction of fresco work in the 14th century gave the deathblow to the

1 Unfortunately the world-wide fame of S. Mark's and the other great churches of Italy has subjected these extraordinary works to the fatal process of "restoration," and wherever any sign of decay in the cement backing (the tesserae themselves are quite indestructible) has given the least excuse the "restorers" have destroyed whole masses of ancient work, and supplied its place with worthless modern copies. The mosaics of the S. Mark's baptistery, and of the apses at S. Miniato, at Pisa, and many other places have in this way been wantonly renewed in recent times.

Fig. 3.—Mosaic of Theodora and Attendants, from S. Vitale, Ravenna; over life size.
true art of wall-mosaics. Though at first the simple and archaic style of Cimabue and his pupils Jacopo da Tura, Giotto, and Taddeo Gaddi was equally applicable to painting or mosaic, yet soon the development of art into greater realism and complexity required a method of expression unfettered by the necessities and canons of mosaic work. Pietro Cavallini, a Roman artist, was one of the last who worked according to the old traditions. His mosaic of the birth of the Virgin in S. Maria in Cosmedin, Rome, executed about the middle of the 14th century, is not without merit, though his superior knowledge of form has only caused his composition to be somewhat feeble and insipid compared with the works of the earlier artists. Even in the 15th century a few good mosaics were produced at Venice and elsewhere. The mosaics from Titian's pictures on the west end of S. Mark's at Venice, Raphael's in the Chigi Chapel in S. Maria del Popolo, and many large pictures in S. Peter's in Rome are the most striking examples of these.

The following list, in chronological order, comprises a selection from among the most important glass wall-mosaics during the period when mosaic-working was a real art.1

4th Century.

Rome. S. Costanza.
S. Maria Maggiore—square panels over the columns of the nave.
S. Pudenziana.
S. Giovanni in Laterano—chapel of S. Rufina e Anastorida.

Naples. S. Restituta—baptistery.

5th Century.

Ravenna. Orthodox Baptistery—vault.
Tomb of Gala Placidia—vault, 450.
Archbishop's Chapel—vault.
S. Paolo fuori le mura—triumphal arch.
S. Maria Maggiore—square pictures over nave columns, and triumphal arch (?).
S. Sabina—figures on west wall.

Milan. S. Ambrogio, Chapel of S. Satiro—vault.

Fundi. Cathedral—apse.
Nola. Cathedral—apse.

6th Century.

Ravenna. Arian Baptistery—vault.
S. Apollinare Nuovo—apse and nave, with 6th-century additions.
S. Vitale—apse and whole sanctuary, c. 547.
S. Apollinare in Classe—apse and nave, c. 549.
S. SS. Cosmas and Damian—apse.

Rome. S. Lorenzo, Chapel of S. Aquilinus—vault.
S. Sophia—walls and vault, c. 550.

Thessalonica. Church of St George—apse, &c.; and S. Sophia—dome and apse.

Tremonzo. S. Sophia—apse.

7th Century.

Rome. S. Agnese fuori le mura—apse, 626.
S. Teodoro.
S. Stefano Rotondo.
Venanzio, baptistery of Lateran.

8th Century.

S. Sereus and Achilles.
Mount Sinai. Chapel of the Transfiguration.

9th Century.

Rome. S. Cecilia in Trastevere—apse.
S. Marco—apse.
S. Maria della Navicella—apse, and "Chapel of the Column.
S. Prassede—triumphal arch.

Milan. S. Ambrogio—apse, 832.

10th Century.

Cordova. Mihrab (sanctuary) of Mosque.

11th Century.

Church of S. Saviour—walls and domes.

12th Century.

Venice. S. Mark's—narthex, apse and walls of nave and aisles.

The Byzantine origin of these great wall-mosaics, wherever they are found, is amply proved both by internal and documentary evidence. The gorgeous mosaics of S. Sophia and S. Saviour's in Constantinople, 6th century, and the later ones in the monasteries of Mount Athos, at Salonica and at Daphne near Athens, are identical in style with those of Italy of the same date. Moreover, the even more beautiful mosaic work in the "Dome of the Rock" at Jerusalem, 7th and 11th centuries, and in the apse of the great mosque of Cordova, of the 10th century, are known to be the work of Byzantine artists, in spite of their thoroughly Oriental design. The same is the case with the rarer mosaics of Germany, such as in S. Gerona at Cologne and at Poreno.

A very remarkable, almost unique, specimen of Byzantine mosaics is now preserved in the "Opera del Duomo," Florence. This is a diptych of the 11th century, of extremely minute, almost microscopic work, in tesserae of glass and metal, perhaps the only example of tesserae made of solid metal. It has figures of saints and inscriptions, each tessera being scarcely larger than a pin's head. This beautiful diptych originally belonged to the imperial chapel in Constantinople, and was brought to Florence in the 14th century.

2. The second medieval class, mosaic pavements, though of great beauty, are of less artistic importance. This so-called <i>opus alexandrinum</i> is very common throughout Italy and in the East, and came to greatest perfection in the 15th century. It is made partly of small marble tesserae forming the main lines of the pattern, and partly of large pieces used as a ground

---

1 It must be remembered that the earlier mosaics have in most cases suffered much from restoration.
Besides the countless churches in Italy possessing these beautiful pavements, such as S. Lorenzo, S. Marco, S. Maria Maggiore, and S. Maria in Trastevere, in Rome, there are in England, in the Chapel of the Conventor, and in front of the high altar at Westminster, very fine specimens of this work, executed about 1268 by a Roman artist called Odericus, who was brought to England by Abbot Ware, on the occasion of a visit made by the latter to Rome. Another English example is the mosaic pavement in front of the shrine of Becket at Canterbury; this is probably the work of an Englishman, though the materials are foreign, as it is partly inlaid with bronze, a peculiarity never found in Italy. Palermo and Monreale are especially rich in examples of seccite mosaic, used both for pavements and walls — in the latter case generally for the bases of the columns while the upper part being covered with the glass mosaics. Fig. 4 gives a specimen of this mosaic from Monreale cathedral. Its chief characteristic is the absence of curved lines, so largely used in the splendid opus Alexandrinum of Italy, arising from the fact that this class of Oriental design was mainly used for the delicate panelling in wood on their pulpits, doors, &c.—wood being a material quite unsuited for the production of large curves.

3. Glass mosaic, used to ornament ambones, pulpits, tombs, bishops' thrones, baldacchini columns and architraves, and other marble objects, is chiefly Italian. The designs, when it is used to enrich flat surfaces, such as panels or architraves, are very similar to those of the pavements last described. The white marble is used as a matrix, in which sinkings are made to hold the glass tesserae; twisted columns are frequently ornamented with a spiral band of this glass mosaic, or flutings are suggested by parallel bands on straight columns. The cloisters of S. Giovanni in Laterano and S. Paolo fuori le mura have splendid examples of these worked stalls and architraves. This style of work was largely employed from the 6th to the 14th centuries. One family in Italy, the Cosmati, during the whole of the 15th century, was especially skilled in this craft. The pulpits in S. Maria in Ara Coeli, Rome, is both of the finest specimens (see fig. 5), as are also the ambones in S. Clemente and S. Lorenzo, and that in Salerno cathedral. The tomb of Henry III. (1201), and the shrine of the Confessor (1265) at Westminster are the best examples of this work in England. They were executed by "Petrus civis Romanus," probably a pupil of the Cosmati.

In India, especially during the 17th century, many Mahommedan buildings were decorated with fine marble inlays of the class now called "Florentine." This is seccile mosaic, formed by shaped pieces of various coloured marbles let into a marble matrix. A great deal of the Indian mosaic of this sort was executed in the 18th century, especially the finest examples are at Agra, such as the Taj Mahal.

4. Mosaics in wood are largely used in Mahommedan buildings, especially from the 14th to the 17th centuries. The finest specimens of this work are at Cairo and Damascus, and are used chiefly to decorate the magnificent pulpits and other woodwork in the mosques. The patterns are very delicate and complicated, and in the case of one of the pulpits at Damascus, often further enriched by bits of mother-of-pearl and minutely carved ivory. This art was also practised largely by the Copts of Egypt, and much used by them to ornament the magnificent iconostases and other screens in their churches.

Another application of wood to mosaic work, called "interiatura," was very common in Italy, especially in Tuscany and Lombardy, during the 15th and early 16th centuries. Its chief use was for the decoration of the stalls and lecterns in the church choirs. Very small bits of various coloured woods were used to make a mosaic effect, the wood being cut out in geometrical patterns, and in some cases the whole building was ornamented with various groups of buildings with strong perspective effects, and even landscapes, were very skilfully produced by an inlay of large pieces. Ambrogio Borgognone, Raphael, and other great painters, often drew the designs for this sort of work. The mosaic figures in the panels of the stalls at the Certosa near Pavia were by Borgognone, and are extremely beautiful. The stalls in Siena cathedral and in S. Pietro de' Casinensi at Perugia, the latter from Raphael's designs, are among the finest works of this sort, which are very numerous in Italy. It has also been used on a smaller scale in ornament forming flutes, etc., to which large trousseau coffers, on which the most costly and elaborate decorations were often lavished.

AUTHORITIES.—Classical. An excellent account of the subject, with full references, is given by Gauckler in Darmen and Saglio, Dictionnaire des antiquités, s.v. "Musivum opus"; the translations here given of the loci classicæ of Pliny are, however, inaccurate. Amongst earlier works the following are important: G. Campani, Vetera monumenta (1690-1699); A. Furtielli, De musivis (1732); A. G. Pavlovsky, Die Mosaiken von Byzanz (1881); E. Ainalov, Enrich Gravina, wood is 15; H. flutings S. Monuments the examples about England, pupil They Westminster 3.

Fig. 5.—Part of Marble Pulpit with glass mosaic, church of Ara Coeli, Rome.
Modern Mosaic.—The art of mosaic for mural decoration has never been deeply implanted in the artistic sensibilities of the north of Europe, nor has it been employed much either in France, or Germany, or England. It ceased to be generally adopted in Italy when fresco, oil and tempera painting came into vogue. Gothic architecture is very little related to its possibilities and the incoming fashion for the latest and least interesting development of classical architecture, “Palladian,” divorced not only it, but mural painting also, from all architectural schemes. To be properly consequent and effective, buildings, ecclesiastical or public, should be constructed with the intention of being covered almost entirely by mosaics, which demand rich environment, marble or other colour; mosaic is essentially a colour medium. It is therefore scarcely surprising that when mural decoration became pre-eminently pictorial, and gestures and expression grew complicated, elaborate, and naturalistic, an art limited in its powers of presenting such manifestation of realistic design was relegated into the limbo of obscurity.

There are no instances of the use of mosaic in England after the Roman occupation. The Normans, who derived it from the Greeks and Saracens, and adopted it in Sicily, did not import it either to France or England. Although English churches, and French also, were highly decorated with polychromy from early times up to the 16th century, there is no evidence of mosaic ever having been used. The revival of a school of mosaicists in Rome during the 17th century, employed in the decoration of St Peter’s, and here and there sparsely engaged in other churches, led to the idea which Wren would have carried into effect, namely, making use of mosaic for the cathedral of St Paul’s in London; but his scheme, if it was ever really entertained, was not carried out, as we know, and the art, which might have become the fashion in England, remained an exotic. Even late into the years of the 19th century mosaic decoration was regarded by classical purists as a barbarous art, and the glorious decorative ideas so vital to ancient Italy, Japan, and India, which are a common bond of Mediterranean and Asiatic Minor and Russia were disregarded as works of high art. They were in many cases cut out to provide room for extravagant and vulgar designs in fresco or tempera, unmeaning, undecorative, and wholly abominable as decoration. Those Roman mosaics over the altars in St Peter’s, being copies of celebrated oil pictures, while they cannot be denied excellence as such and marvellous dexterity, reveal the worst possible taste, for they attempt to represent adequately, in cubes, touches of the brush which were spontaneous, fluid, thick and thin, and as sensitive and spontaneous as the finger pressure on the violin string, so accurately that the least deviation from absolute position produces discord.

The restrictions on mosaic are many, and some are obvious. In the first place, mosaic is not suited for a small scale of design. It is true that in the Opera del Duomo in Florence there is a miniature mosaic (executed in the 12th century) of extraordinary beauty, which must have taken a lifetime to execute; but still this remains a curiosity, a bit of craftsmanship rather than a great work of art. There is also a copy of Mr Holman Hunt’s “Finding the Saviours in the Temple,” executed for Clifton College, Sheffield, and Messrs Powell’s in Messrs Miller’s Wells Road, London; it is admirably done, no doubt, but it is a long way behind the original, which is a design wholly ill adapted to mosaic. There are several other instances, notably one by Mr H. Holiday of the “Last Supper,” where mosaic has been employed to translate a beautiful design which would have been more satisfactorily executed either in oil or water colours. The primal and most obvious limitation is in matters of detail — detail as regards a multiplicity of forms, many gradations over a facade, or colour and naturalistic accidents. In this respect good mosaic is like good baso relief; it is accomplished by firmly pronounced outlines, unconfused masses, large planes unbroken up by small adjuncs, and generalized and conventionalized forms and simple colour. So all small curves, as well as small tints, should be eliminated, because it is not in the nature of the material to do them justice. One can scarcely conceive a choice less happy for mosaic than the centre group taken out of the upper portion of the Disputa fresco in the Vatican by Raphael, yet this florid piece of work, so facile in creation, was chosen to be executed on the eastern wall of the morning chapel in St Paul’s. It is this which was intended to illustrate the many similar mistakes that have been made. They were made in some of the earlier work in the choir of St Paul’s. The best example of mosaic on a small scale is in Ravenna, the tomb of Galla Placidia; the best upon a large scale is the great Christ at the east end of the cathedral at Monreale. These two works absolutely justify the means to the end. Interesting are the designs made by Sir Edward Burne-Jones for the mosaics for the American church in Rome, but the execution and colour are alike monotonous. The cathedral of Chester contains a series of mosaic pictures designed by Mr Clayton. The Guards’ chapel in St James’s is adorned likewise by the same artist, under the direction of the late Sir Arthur Blomfield. In the chapel for the school at Giggleswick are mosaics designed by T. G. Jackson, R.A., admirably and broadly treated in true mosaic character; these were executed in situ, and not, according to the modern habit, upon paper, away from their environment and by a foreign firm. Those mosaic pictures which are placed in niches in the great gallery of South Kensington Museum are failures qua mosaic, though the designs in many instances are fine, notably those by Lord Leighton and VaS. The picture of the Louvre is the most interesting, because the cubes are laid so flatly and so evenly that they suggest an oil picture appliqué upon a flat ground.

Messrs Powell have been employed on several occasions to decorate churches with mosaic. This firm has adopted the old style, and rejected the new one initiated by Dr Salvati of Venice. If we observe the surface of a fine Greek mosaic, such as that of Andrea Tafi in the Baptistry of Florence, or the few remains of unrestored mosaic in St Mark’s, Venice, or indeed other works scattered over Italy, we shall see that it is rough, not smooth; the cubes may or may not show the same crispness. It is more in the space of the ground colour left, red or white, and visible between each cube. In modern mosaic, with rare exceptions, restoration or other, the cubes have been jammed up closely together, and the surface is as smooth as a piece of paper; thereby is engendered a mechanical and uninteresting surface, over which light plays with monotonity, and hence that brilliant and scintillating effect so essentially the character of true mosaic is absent. This defect — and it is a grave one — is evident in the works in mosaic more or less recently set up in Paris, notably in the apse of the Pantheon, the east end of the Maddeleine, and the vaulting of the Basilica of St Sulpice. The same principle may apply to the mosaics in recent years set up on the west front of Santa Maria del Fiore in Florence. The very first principles which go to make a fine picture are just those which should be avoided in mosaic — elaborate modelling, delicate transitions of light and shade and picturesque effects of dark and light, materialistic resemblance indeed. The designer for mosaic should ever bear in mind his material, and in his designs for it he should accentuate those characteristics which belong essentially and specifically to mosaic and to no other technique. If he is a painter, he must lose his heart to that art and take up with new ones — those which teach broad masses of colour obtained in lines. He will find that effects gained by a technique employed in oil colour look bald and ridiculous when translated into mosaic. Water-colour and pastel are by far the best media for cartoons to be copied in mosaic. We do not know how these were executed
MOSAIC

in ancient days; probably the design was drawn on the wall, and there were no cartoons. The master not only invented, but he was the master-workman also, and that is how it should be. The probability is that the custom of drawing the design upon the wall practised by the early frescati was the survival of a method adopted by the mosaicists, just as their method repeated that of Roman and Greek wall-painters. Of course this direct method leads to a large style, a style harmonizing with environment, and not requiring red or yellow or green to draw small in a small one. Anyhow, this is quite certain, that all the fine Byzantine and 15th century mosaics, as well as wall paintings, were executed in situ and not away, as was the usual custom in England and elsewhere until recently.

Mr. Harry Powell has permitted the writer to make use of some of his reflections upon the mosaicist's art in the following notes. The mosaicist should not separate the artistic from the technical details of his craft. He must study not only the decorative effect, form, colour and spacing of his design, but the surface to be covered as well as the materials with which he builds.

Surface.—Good brick-work, the mortar joints slightly cut back, affords the best foundation for mosaic. The hollow and sharp-edged joints provide a key for the cement into which the cubes will be set, and they diminish the risk of sagging, a not uncommon event when cement is exuded by being put in contact with the joints. If the mosaic is to be applied on stone, the stone must be notched and well roughened to provide support. Whether the mosaic is of cement or plaster, it must be added with oil to prevent suction, because if too much suction takes place the powder only of the cement will remain and the cubes will drop out.

Cement.—A cement suitable for mosaic is one which retains its tenacity even when dry and which sets in bond, which sets in bond, and which is not liable to change colour after long exposure. These conditions are best met by an oil cement. One consisting of equal weights of white oxide of zinc and carbonate of zinc, mixed with double boiled oil and containing small proportions of white lead and slaked lime gives good results. This cement can either be white or red, white where greyness of tone is desirable, red where a richer effect is required. It is generally mixed with a small proportion of oxide of iron or oxide of manganese, which prevents the whiteness of the joint from rendering adjacent tints grey from a distance.

Atmospheric Corrosion.—As the atmosphere of modern towns is more corrosive than that of medieval Venice or medieval Rome, it is important that, in choosing the cement and the materials to be imbedded in it, the mosaicist should be certain that they are impervious to atmospheric impurities.

Glass.—Although marble, mother of pearl, and other substances have been, and are still, occasionally used, the predominant material in ancient as well as modern mosaics is glass. When prepared with due consideration to the effect it is to produce, its ingredients are impervious to the action of ordinary acids, and is practically indestructible. It can be made to assume almost every shade and tint of colour (see Glass). There are many kinds of glass, but the most important and the other side, the one usually employed. Both of these glasses can be rendered opaque by mixing with the ingredients either oxide of tin or a mixture of feldspar and fluorspar. Glass rendered opaque by the admixture of feldspar and fluorspar has a bright, vitreous, easily cleaned surface, and readily develops brilliant colours.

Production of Colours.—Colours are obtained by mixing and melting with the ingredients of the opaque glass small proportions of certain metallic oxides. Oxide of chalk gives a purple blue; oxide of copper gives a peacock blue; oxide of copper with oxide of iron gives a green; oxide of copper mixed with oxide of iron and a strong blue tint gives a red; oxide of chromium a green oxide of nickel a purple; oxide of uranium a yellow; and oxide of manganese a violet—or a black if a larger quantity of oxide is used.

Manufacture of Glass Slabs.—The mixtures, in a state of powder, are shovelled into crucibles standing round the grate of a furnace, and when fusion is complete the viscous glass can be coiled upon the heating agent and removed for use, very much in the way that thick treacle may be coiled round the bowl of a spoon. A mass of molten glass, thus collected, is allowed to fall upon a flat iron table, and is pressed into a slab about 6 in. square and 4 in. thick. The excess or overhung edges are then removed, allowed to cool slowly, and when cool are removed and broken by a hammer or a miniature guillotine into tesserae or cubes. The fraction of each tessera is used for the surface of the mosaic.

Gold and Silver Slabs.—The tessera containing gold or silver leaf are as impervious to surface corrosions from the effects of atmosphere as the solid colours. The process of manufacturing a gold or silver slab for mosaic work is to spread the metal leaf on a very thin tray of transparent glass, about 5 in. in diameter and after it has been heated to press upon the surface of the leaf a mass of molten glass, so as to create cohesion between the molten glass and the glass tray through the pores of the metallic leaf. The slab thus formed contains gold, and if the slab after it has been cooled is strongly reheated, the leaf becomes sufficiently disintegrated to allow the colour of the background to show through, with the result that the color effect of the metallic leaf is modified.

Tinted Metals.—By using powdered glass or the tin glass trays which form the surface of the metallic slabs a variety of tinted metallic effects are obtained. Moreover, if the glass which is to form the background is colored, a line of desire is obtained, but if the glass is not colored, this line, which is slightly molded, is generally not noticed. The scale, or cement, is of red or yellow, and the tin glass is of a different shade, the result being a tinted metallic effect which is generally not noticed.

Palettes and Tools.—The palettes of the mosaicist are a shallow box with many partitions, each division containing different coloured tesserae. The only tools required are clippers, for shaping the tesserae, and a pair of tweezers, by which they are inserted into the cement the outlines of the design. Although the process and tools are simple, it requires prolonged training of mind, hand, eye and fingers to enable a workman to create in mosaic a living representation as distinguished from a lifeless copy of the master craftsman's design.

Drawing directly on the Wall. Curved Surfaces.—If the mosaicist desires to draw his cartoon directly upon the wall, a necessary procedure where curved surfaces are presented, he goes to work in the following manner. He causes a model to be made to scale of a dome, semi-dome or spandrel and upon it he draws his design with a brush in strong red pigment, having previously squared up the whole surface to scale. This done, he causes the dome, semi-dome or spandrel to be covered over with thick brush layer. This being dried to a hard, but sufficiently only to give temporary adhesion, the brown paper is squared up to the scale of the small sketch; each square being relatively numbered. The master then sets his pupils to work to draw mechanically and copy accurately from the small design on to the full-sized dome, semi-dome or spandrel. This done, the master follows on, correcting with charcoal or brush until the whole design is developed in strong outline. Having made a slightly coloured sketch, the master with the aid of his pupils proceeds to mix all the tints in water-colour, adding colle di pace or fish glue, and a little honey to prevent cracking. He then applies every tint separately, keeping each distinct, and above all minding that the local colours of all half-tints are different from the colour of all shadows. This done, he dips his brush in black and draws all the outlines, the thickness of which depends upon the distance which will intervene between his work and the spectator; in order that the black may not appear cold from a distance, he will add to one side of the line, a red line, thicker or thinner than the black, according to the effect he wishes to produce. It is sometimes effective to add upon the red line a transparent blue, or better, a blue of green line, so that the purple effect of the black and red shall be moderated.

Colour.—We now come to the great question of colour and how to obtain it simply, and so that from a distance a blazed and woolly effect is not obtained. There should be a marked and sharp definition between all tints; they should not be fused; they should look sharply defined, as the squares upon a chessboard, and appear crude and brutal. The work which looks least refined near at hand looks more finished at a distance. Red and blue lines alternatively laid, either more red or more blue, can be used towards red or blue, make the best purple. Green is best made with yellow and blue lines, the masses being separated by red lines, and the shadows of green should be red or blue: if red, they should be outlined with blue; if blue, with red. Red should be treated flatly, shaded with a deeper red, which should be of a warmer tone than the lights. Blue should be shaded with blue or red; and it is well to mix green tesserae with the blue in the lights, and again green tesserae with the blue or red shades to modify crudity. Pure white should be very sparingly used; it expands greatly at a distance. The best white is that which is of the tone of Naples yellow. Whenever it is necessary to use pure white, either a yellow or pink line should be set on one side of it.

It is impossible to keep the flesh too simple. The local colour, i.e. a red orange, is the staple colour. Features should be drawn
in strong red or burnt sienna, or a rich brown. The outlines of limbs or the contours of faces should be made first with a green line, a little darker than the local tints, then a red line darker still, then a black or brown line. White drapery is capable of being treated with endless variety. Their shadows may be green, red, blue, grey or yellow. If the white drapery is to take a neutral tone when seen from a distance, all these tints should be employed, because when mixed those positive colours appear neutral when seen from afar.

Gold drapery has a fine effect. Bright gold expands to four times the width of the line, so that the lines of gold should be thin. It may be that the gold drapery is to appear greenish, like the green of the foliage. Gold is drawn upon the outline with red. All deep shades should be treated with red and hot browns. As gold expands so considerably, a larger interval should be left between the tesserae than between any other colour, even white. Each tessera should have a thin space of the ground colour round it. The tesserae should never be jammed; it is that which causes so many modern mosaics to look like oil-cloth or chromo-lithographs.

The Finished Cartoon.—The finished cartoon, having been coloured in lines, should look exactly like the finished mosaic as regarded the effect. The master, while still absently; should always bear in mind that he is designing for mosaic, and not making a finished picture. The cartoon, when complete, is taken off the wall and cut up in pieces. Each piece is then carefully traced. The space upon the wall corresponding to each section is then covered with cement, but only upon that portion of the space which can be worked in mosaic in a day. The mosaic worker then applies the portion of the tracing upon the wet cement, and with a sharp point he pricks through the paper upon the lines thereon drawn; on removing the tracing he will find indentations within the surface of the cement, which give him his clue to all the forms. Setting up the coloured design by his side, he takes the tesserae, which exactly correspond in colour and tone with those on the drawing, and begins his work, commencing from the outline and working inwards towards the centre, the lightest portion being left to the last. Here comes in the real test whether the craftsman is capable of the reverse. This is soon judged by the master, who will put the work in and out until he is satisfied with the result. Unless the master has himself gone through the drudgery of laying the tints, he can be no master. He must be a craftsman as well as a designer, and must know by experience and practice in a very difficult craft what the material can do with ease and what it is not called upon to do by reason of its inherent limitations. If he has not so trained himself he is certain to pictorialize what he should conventionalize; and, moreover, he will set technical difficulties in the way which are impossible to overcome. He must aim at the greatest simplicity without dulness, at producing the greatest effect by the simplest means, and to do that he must know his material or fail. (W. B. Rt.)

Mosby, John Singleton (1831— ), American soldier, was born in Edgemont, Powhatan county, Virginia, on the 7th of December 1831. He graduated at the university of Virginia in 1852, was admitted to the bar in 1855, and practised law in Bristol, Washington county, Virginia, until the beginning of the Civil War, when he joined the cause of the South. He enlisted as a private in the Washington Mounted Rifles, which became a part of General J. E. B. Stuart’s 1st Virginia Cavalry, and of which he was adjutant for a time. In June 1862, after having gone over the ground alone on scouting duty, he accompanied Stuart in his ride through McAllister’s entire army. Early in 1863 he secured Stuart’s permission to undertake a quasi-inde- pendent command. In Fairfax county and then in Fauquier and Loudoun counties (known as Mosby’s Confederacy), within the Federal lines, he raised, mounted, armed and equipped a force of irregulars. On the night of the 8th of March 1863, with about 30 men, he penetrated the Federal lines at Fairfax Court-House and took 33 prisoners, including Brigadier-General Edwin H. Stoughton, commanding the 2nd Vermont brigade; and he became famous for other such exploits. In the North he was regarded as a guerrilla who disregarded the rules of war, and in the autumn of 1864, Sheridan, acting under orders from Grant, shot and hanged seven of Mosby’s men without trial; in November Mosby retaliated by hanging seven of Custer’s cavalrymen. Eventually, on the 21st of April 1865, twelve days after the surrender of General Lee, he disbanded his men and surrendered; and through the influence of General Grant, who later became his personal friend, he was paroled. He returned to his legal practice, joined the Republican party, canvassed Virginia in 1872 for General Grant, in 1878-1885 was United States consul at Hong-Kong, and after practising law in San Francisco, was president of the Federal Intemperance Society, and was a member of the U.S. House of Representatives from 1901 to 1907. He wrote Mosby’s Reminiscences and Stuart’s Cavalry Campaign (Boston, 1882), and—a defence of Stuart and of Lee—Stuart’s Cavalry in the Gettysburg Campaign (New York, 1908). See J. Marshall Crawford, Mosby and his Men (New York, 1867); A. Monteiro, War Reminiscences by the Surgeon of Mosby’s Command (Richmond, Virginia, 1890); James J. Williamson, Mosby’s Rangers (New York, 1900); John W. Munson, Reminiscences of a Mosby Guerrilla (New York, 1906); John H. Alexander, Mosby’s Men (New York, 1907); and Partisan Life with Mosby (New York, 1867), by a friend, who drafted the Partisan Ranger Law, under which Mosby’s command operated.

Moscheles, Ignaz (1794—1870), Bohemian pianist, was born at Prague on the 30th of May 1794, and studied music at the Conservatorium under the direction of Dionys Weber. At the age of fourteen he made his first appearance before the public in a pianoforte concerto of his own composition with marked success. In 1814 he prepared, with Beethoven’s consent, the pianoforte arrangement of Fidelio, afterwards published by Messrs. Artaria. In the following year he published his celebrated Variationen über den Alexandermarsch, a concert piece which first appeared at a private concert in London, and at a benefit concert in which he was at once recognized as the most brilliant performer of the day. He then started on a tour, during the course of which he visited most of the great capitals of Europe, making his first appearance in London in 1822, and there securing the friendship of Muzio Clementi and John Cramer. For a concert given by the latter he wrote his famous Hommage à Händel, a duet for two pianofortes, which afterwards became a lasting favourite with the public. During a visit to Berlin in 1824 he first became acquainted with Mendelssohn, then a boy of fifteen; and who, incidentally, organized a society for the encouragement of music. During the winter of 1824-25, Musical Life in London, and settled permanently in London. He was undoubtedly for some considerable time the greatest executant of his age; but, using his brilliant touch as a means and not as an end, he consistently devoted himself to the further development of the true classical school, interpreting the works of the great masters with conscientious fidelity, and in his extempore performances, which were of quite exceptional excellence, exhibiting a fertility of invention which never failed to please the most fastidious taste. In 1837 Moscheles conducted Beethoven’s Ninth Symphony at the Philharmonic Society’s concerts with extraordinary success, and by his skilful use of the baton contributed to the prosperity of this association. During the course of his long residence in London he laboured incessantly in the cause of art, until the year 1846, when, at Mendelssohn’s earnest solicitation, he removed to Leipzig to carry on a similar work at the Conservatorium, and then recently founded. In this new sphere he worked with unabated zeal for many years, dying on the 10th of March 1870. Moscheles’ numbered works extend to 145, apart from minor pieces. His most important compositions are his Pianoforte Concertos, Sonatas and Studies (Études, op. 70) and Characteristische Studien, op. 95; Hommage à Händel; and his three Allegri di bravura.

See The Life of Moscheles (1873), a translation by A. D. Coleridge of Mine Moscheles’ Aus Moscheles Leben (1872).

Moscherosch, Johann Michael (1661—1669), German satirist, was born at Willstätt, near Strassburg, on the 5th of March 1601. He received a careful early education at the
MOSCHOPULUS—MOSCOW

Latin School at Strassburg, and in 1620 began his academic career as a student of jurisprudence. After being for some years tutor in the family of the Graf von Leiningen-Dachsburg, he finally became privy councillor to the landgrave of Hesse-Cassel. He died at Worms on the 4th of April 1669. Under the name of "Der Träumende," Moscherosch was a member of the Fruchtbringende Gesellschaft, a society founded by Prince Ludwig of Anhalt-Cöthen, in 1617, for the purification of the German language and the fostering of the German literature. His most famous work is the Wunderliche und sehrbärgige Geschichte Philianders von Siltewald (anagram of Willistäd), (1642-1643), for which he took as his model the Suehol (visions) of the famous Spanish Francisco Gomez de Quevedo y Villegas (1580-1645). Hardly inferior to the "visions" is the Insomnis eura parentum, Christliches Vermächtnis eines Vaters, which was published at Strassburg in 1643 and again in 1647. Note-worthy is also Die Patientia, discovered in 1897 in MS. in the municipal library at Hamburg.

Selections from Moscherosch's writings have been published by W. Dittmar (1830), F. Bobergh (in Kürschner's Deutscher National-Literatur, xxxii, 1884), and K. Müller (in Reclam's Universalbiographien). Reprints of the Insomnis eura parentum and Patientia have been published by L. Partner (1893 and 1897), who is also the author of Beiträge zu einer Biographie von Moscherosch (1891). See also M. Nickels, Moscherosch als Pädagog (1883); J. Wirth Moscherosch's Geschichte (1898).

MOSCHOPULUS ("little calf," probably a nickname), MANUEL, Byzantine commentator and grammarian, lived during the end of the 15th and the beginning of the 14th century. His chief work, the Monasticon, in the form of question and answer, based upon an anonymous epitome of grammar, and supplemented by a lexicon (σταλογυη) of Attic nouns. He was also the author of scholia on the first and second books of the Iliad, on Hesiod, Theocritus, Pindar and other classical and later authors; of riddles, letters, and a treatise on the magic squares. His grammatical treatises formed the foundation of the labours of such promoters of classical studies as Manuel Chrysoloras, Theodorus Gaza, Guarini, and Constantine Lascaris.

A selection from his works under the title of Manuelis Moschopuli opuscula grammatico was published by F. N. Tite (Leipzig, 1822); see also C. Krumbacher, Geschichte der byzantinischer Literatur (1897) and M. Treu, Maximi monachi Planulis epistulae (1890), p. 208.

MOSCHUS, Greek bucolic poet and friend of the Alexandrian grammarian Aristarchus, was born at Syracuse and flourished about 150 B.C. He was the author of a short epic poem, Europa, and a pretty little epigram, Love, the Runaway, imitated by Torquato Tasso and Ben Jonson. The epitaph on Bion of Smyrna, wrongly supposed to have been his tutor, was in all probability written about the time of Sulla (see F. Bühcher in Rheinisches Museum, xxx., 1875). The poem on Megara (the wife of Heracles) is probably not his, but a few other pieces, undoubtedly genuine, have been preserved. His poems are nearly all in hexameters. They are usually printed in editions of Bion and Theocritus, and have been translated into many European languages.

The text has been edited by U. von Wilamowitz-Molendorff, in the Oxford Scriptorum classicorum bibliotheca (1905); there are English translations by J. Banks in Bohn's Classical Library (1853), and by Andrew Lang (1886), together with Bion and Theocritus. See F. Susemihl, Geschichte der griechischen Literatur in der Alexan- drinerzeit, i. 231 (1891), and article Bion.

MOSCOW (Russian Moskva), a government of Central Russia, bounded by the governments of Tver on the N.W., Vladimir and Ryazan on the E., Tula and Kaluga on the S., and Smolensk on the W., and having an area of 12,855 sq. m. The surface is undulating, with broad depressions occupied by the rivers, and varies in elevation from 300 to 850 ft. The government is situated in the centre of the Moscow coal-basin, which extends into the neighbouring governments. Its geology has been carefully studied, and it appears that in the Tertiary period, the surface of this province was already continental; but during the Cretaceous period it was to some extent overflowed by the sea. Jurassic deposits are represented by their upper divisions only; the lower ones, as well as Triassic and Permian deposits, are wanting. The Carboniferous deposits are of a deep-sea origin, and are only represented by the upper division which lies upon Devonian deposits, discovered in an artesian well at Moscow at a depth of 1508 ft. The pendulum anomaly, noticed by Kaspar Gottfried Schweitzer (1816-1873), has been investigated. It appears in a zone 10 m. wide and about 95 m. long from west to east, and is positive (+10-6) to the north of Moscow and negative (−2-7) to the south.

The river Moskva is drained by the Volga, which skirts it for a few miles on its northern boundary, by the navigable Sestra, which brings it into communication with the canals leading to St Petersburg, by the Oka, and by the Moskva. The Oka and Moskva from a remote period have been important channels of trade, and continue to be so notwithstanding the development of the railways. The Oka brings the government into water communication with the Volga. Extensive forests (39% of the entire area) still exist. The soil is somewhat unproductive; agriculture is carried on everywhere, but only two districts export corn, all the others being less or dependent on extraneous supplies. The principal crops are rye, oats, barley, potatoes, with some flax, hemp and hops.

The population, 1,913,700 in 1873, numbered 2,430,549 in 1897, and 2,733,300 in 1906. They are nearly all Great-Russians and belong to the Greek Church (4% Nonconformists). The importance of the Moscow government as a manufacturing centre is steadily increasing, and it now stands first in Russia.

The chief factories are for cottons, woolens, silks, clothing, pottery, perfumery, steel, sugar refineries, distilleries, iron-works. There is besides a very great variety of minor industries—such as the weaving of thin silk and gold brocades, and gold and silver jewelry, bronze, perfumery, waxes, tobacco, tanneries, gutta-percha, furniture, carriages, paper, toys, baskets, lace, and papier-mâché. The government is divided into 13 districts.

The prehistoric archaeology of Moscow has been carefully studied. This district has been inhabited since the Stone Age. Bronze implements are rare, and there are places where instruments of stone, bone and iron are found together. The inhabitants who constructed the burial mounds in the 10th to 12th centuries seem to have been of Finnish origin, and were poorer, as a rule, than their contemporaries on the Volga.

MOSCOW, (Russian Moskva), the second capital of the Russian empire, and chief town of the government of the same name, in 55° 45' N. and 37° 37' E., on both banks of the river Moskva, a tributary of the Oka. It is by rail 400 m. from St Petersburg, 1017 from Odessa, and 814 from Warsaw. It lies to the north of the most densely peopled parts of Russia (the "black-earth region"), whilst the country to the north of Moscow is rather thinner populated as far as polity, the ground is sparsely beyond that. The space between the middle Oka and the Volga, however, was the cradle of the Great-Russian nationality (Novgorod and Pskov excluded); and four or five centuries ago Moscow had a quite central position with regard to that region.

The present city covers an area of 32 sq. m. (about 40 when the suburbs are included). In the centre, on the left bank of the Moskva, stands the Kremlin or Kremlin, occupying the Borovitsky hill. To the east of the Kremlin is the Kitay-Gorod, formerly the Great Posad, the chief centre of trade. The Byelyi-Gorod, which was formerly enclosed by a stone wall (whence the name), surrounds the Kremlin and the Kitay-Gorod on the west, north, and north-east. A line of boulevards now occupies the place of its wall (destroyed in the 18th century), and forms a first circle of streets round the centre of Moscow. The Zemlyanoy-Gorod (earthen enclosure) surrounds the Byelyi-Gorod, including the Zamoskvornechye on the right bank of the Moskva. The earthen wall and palisade that formerly enclosed it no longer exist, their place being taken by a series of broad streets with further ones on both sides—the Sadovaya, or Gardens Street. The fourth enclosure (the Kamer College earthen wall) was made during the reign of Catherine II.; it is of irregular shape, and encloses the outer parts of Moscow.
MOSCOW

...whilst the suburbs and the villages which have sprung up on the highways extend some miles beyond.

The Kremlin is an old fort of pentagonal (nearly triangular) shape, about 100 acres in extent, occupying a hill 130 ft. above the level of the Moskva. It is enclosed by a high stone battlemented wall 2430 yds. in length, restored during the 19th century, and having nineteen towers. Its five gates are surmounted by towers and are all noteworthy. The Spaskiya (Saviour’s) Gate was erected in 1491 by a Milanese architect; the Gothic tower (203 ft.) that surmounts it was added in 1625 by the English architect, Holloway. A sacred picture of a Saviour (the “palladium of Moscow”) was placed upon it in 1614, and all who pass through the gate uncover. The towers surmounting the other four gates were erected by order of Ivan III. Of the sacred buildings of the Kremlin the most venerated is the Uspenskiy cathedral. The former church of this name was erected in 1326 by the tsar, Ivan Kalita, but, on its falling into disrepair, a new one was built on the same place in 1475-1479, by the Bolognese architect, Fioraventi, in the Lombardo-Byzantine style, with Italian cupolas. It was restored each time after being pillaged or burnt in 1429, 1547, 1682, and 1812. It contains the most ancient and most venerated holy pictures in Russia, one of which is attributed to the metropolitan Peter, another to St Luke. The cathedral possesses also the throne of Vladimir I., and numerous relics of saints, some of which date from the 14th century. The Russian metropolitan and patriarchs were consecrated in this cathedral, as well as the tsars after Ivan IV. The Arkhangel cathedral, on the opposite side of the square, was originally built in 1333, and a new one was erected in its place in 1595-1598. It contains the tombs of the tsars from Ivan Kalita (1340) to Ivan Alexeyevich (1666), and possesses vast wealth. The Blagoveschenskiy cathedral, recalling the churches of Mount Athos (in Turkey), was first built in 1397, rebuilt in 1484-1489, and restored in 1885-1896; the remarkable pictures of Rublev (1405) are still preserved. It was the private chapel of the tsars, and in it they are baptized and married. Vestiges of a very old church, that of the Saviour in the Wood, contemporaneous with the foundation of Moscow, still exist in the yard of the palace. A stone church took the place of the old wooden structure in 1339, and was rebuilt in 1537. The Voznesenskiy convent, erected in 1380-1393, and restored in the end of the 19th century, is the burial-place of wives and sisters of the tsars. The Chudov monastery, erected in 1358-1365 and rebuilt in 1771, was the residence of the metropolitans of Moscow and a state prison.

Close by, the great campanile of Ivan Velikiy, erected in the Lombardo-Byzantine style by Boris Godunov, in 1600, rises to the height of 271 ft. (318 ft. including the cross), and contains many bells, one of which weighs 64½ tons. Close by is the well-known Tsar-Kolokol (king of the bells), 63 ft. in circumference round the rim, 19 ft. high, and weighing 196½ tons. It was cast in 1735, and broken during the fire of 1737 before being hung. The treasury of the patriarchs in the campanile of Ivan Velikiy contains not only such articles of value as the sakkos (episcopal robes) of the metropolitans with 70,000 pearls, but also very remarkable monuments of Russian archaeology. The library has 900 Greek and 1000 very rare Russian MSS., also the Gospel of the 8th century. The great palace of the tsars, erected in 1838-1849, is a fine building in white stone with a glazed cupola. It contains the teremts or rooms erected by Tsar Michael Feodorovitch for the young princes his sons in 1636 (see Peter I), 1636-1649, their former chambers being maintained, a remarkable monument of the domestic life of the tsars in the 17th century. In the treasury of the tsars, in the Orujcynaya Palata, now public museums, the richest stores connected with old Russian archaeology are preserved—crowns, thrones, dresses, various articles of household furniture belonging to the tsars, Russian and Mongolian arms, carriages, &c. The Granovitaya Palata, another wing of the great palace, consists of a single-vaulted apartment built in 1473-1490, and is used as a state banquetting hall.

The four sides of the Senate Square are occupied by buildings of various dates, from the 15th century onwards. Among them is the imposing senate, now the law courts, erected by Catherine II. (1771-1785). Facing it is the arsenal (1701-1736). The temple of the Saviour, begun in 1817 in commemoration of the events of the French campaign of 1812, was abandoned in 1827, and a new one was built during 1838-1883 on a hill on the bank of the Moskva, at a short distance from the Kremlin. Its style is Lombardo-Byzantine, with modifications suggested by the military taste of Nicholas I.

The Kitay-Gorod, which covers 121 acres, is the chief commercial quarter of Moscow. It contains the new bazaar—a triple block of buildings erected in 1888-1895 in sandstone, at a cost of over £1,650,800, and the Gostinoy Dvor, consisting of several stone buildings divided into 1200 shops. The Red Square, 900 yrs. long, with a stone tribunal in the middle, which was formerly the forum, market cross and place of execution separates the bazaar from the Kremlin. At its lower end stands the fantastic Pokrovskiy Cathedral (usually known as Vasili Blazhenny), one of the wonders of Moscow, on account of its towers, all differing from each other and representing, in a lively trade. Here are situated the Okhotny Ryad (poultry and game market) and the streets Tverskaya, Petrovka and Kuznetsky-Most the rendezvous of the world of fashion. Here also are the theatres, the industrial art museum, imperial bank (1894), and Rozhdestvenskiy convent (founded in 1386). In the south-west of the Byelyi-Gorod, opposite the Alexander Garden on the west side of the Kremlin, stand the university (see below), museum of domestic industries, Rumyantsev Museum and church of the Redeemer. This last, built in the form of a Greek cross in 1837-1883 at a cost of nearly £1,600,000, is dominated by five gilded domes and faced externally with marble. Its interior is harmoniously decorated with gold and marble, and adorned with pictures by Verestchagin and other Russian artists. In the east of the city are three monasteries all dating from the 14th century.

The Zemlyanoy-Gorod, which has arisen from villages that surrounded Moscow, exhibits varied characteristics. In the neighbourhood of the railway stations it has busy centres of traffic; other parts are manufacturing quarters, whilst others—for instance, the small quiet streets on the west of the boulevard Prechistenkiy, called the old Komeshennaya, with their wooden houses and spacious courtyards—are the true abodes of the families of the old, for the most part decayed, but still proud, nobility. The Zamoskroyechie, on the right bank of the Moskva, is the abode of the patriarchal merchant families.

The climate of Moscow is cold and continental, but healthy. The average annual temperature is 49° F. (Jan., 14°; July, 66°). The summer is warm (64°-72°), and the winter cold and dry (15°-8°), great masses of snow lying in the streets. The spring, as is usually the case in cold continental climates, is beautiful. The prevailing winds are south-west and south.
The river Moskva is frozen, on the average, for 153 days (from Nov. 12 to April 13).
The Moskva is crossed by five bridges; a branch of it, or rather a channel, makes an elongated island in the middle of the city. Water of excellent quality, principally from the Mytishchi springs and ponds, 11 m. distant, has since 1893 been led to fountains in different parts of the city, whence it is distributed by water-carts.
The population was estimated at only 150,000 in the middle of the 18th century, and at 250,000 in 1812. Since 1870 it has been growing at the rate of about 2% per annum; (1872), 601,660; (1882), 753,469; (1902), 1,092,360, or including the suburbs 1,173,427; (est. 1907), 1,359,254. The housing problem is of great importance in Moscow, as it appears that over 10% of the dwelling-cells are under a room for the city is two occupants to each room, there are more than 10,000 domiciles which have more than four occupants to each room, representing one-fourth of the population. The average mortality is consequently high, namely 28 per 1000 (33 per 1000 if the children inmates of the Foundling House be included). Fires occur very frequently. The inhabitants are mostly Great Russians. They belong chiefly to the Orthodox Greek Church, or are Nonconformists; the Lutherans number 2% and the Roman Catholics 1%.
Since the 14th century Moscow has been an important commercial city. About the end of the 15th century its princes transported to Moscow, Vladimir, and other Russian towns no fewer than 18,000 of the richest Novgorod merchant families, and took over the entire trade of that city, entering into direct relations with Narva and Livonia. The annexation of Kazan (1552) and the conquest of Siberia (1582-1602) gave a new importance to Moscow, bringing it into direct commercial relations with Khiva, Bokhara and China, and supplying it with Siberian furs. The fur-trade had a great fascination for all European merchants in the 16th century, and an English company, having received the monopoly of the Archangel trade, caused their merchandise to be sent by the White Sea instead of by the Baltic. Moscow thus became the centre for nearly the entire trade of Russia, and the tsar himself engaged in large commercial operations. Situated at the intersection of six important highways, Moscow was the storehouse and exchange-mart for the merchandise of Europe and Asia. The opening of the port at St Petersburg affected its commercial interest unfavourably at first; but the Asiatie trade and internal trade of Moscow have since then enormously increased. Here are concentrated the traffic in grain, in hemp and in oils sent to the Baltic ports; in tea, brought both by way of Siberia and of St Petersburg; in sugar, refined here in large quantities; in grocery wares for the supply of more than half Russia and all Siberia; in tallow, skins, wool, metals, timber, wooden wares, iron and steel goods, wine, drugs, raw cotton, silk and all other produce of the manufactures of middle Russia. As a railway centre the city plays so predominant a part that ½ to ¾ of all the goods carried by the railways of European Russia are loaded or unloaded at Moscow. The banks, including the mortgage banks, are the most important in Russia.
From the 15th century onwards the villages around Moscow were renowned for the variety of small industries which they carried on; the first large manufactures in cottons, woolen fabrics, silk, and the like, in the glass and tile industry in Great Russia were established at Moscow in the 17th and 18th centuries. After 1830, in consequence of protection tariffs, the manufactories in the government of Moscow rapidly increased in number; but two-thirds of them are now concentrated in the capital. Moscow is in fact the principal manufacturing city in the empire, employing about 100,000 operatives in its mills and factories. Nearly one-half of them are engaged in the textile industries, especially calico-printing. Next in importance comes the preparation of food-stuffs, followed by the metal and metallurgical industries and the chemical works.
Moscow has many educational institutions and scientific societies. The university, founded in 1755, exercised a powerful influence on the intellectual life of Russia during the years 1830-1848; and it still continues to be the most frequented Russian university. In 1904 it had over 5000 students, who are mostly poor. The library contains some 286,000 volumes, and has rich collections in mineralogy, geology and zoology. Among the museums the Rumynstev, now connected with the so-called public museum, occupies the first rank. It contains a library of 700,000 volumes and 2300 MSS., remarkable collections of old pictures, sculptures and prints, as well as an extensive mineralogical collection, and an ethnographical collection representing very accurately the various races of Russia. The private museum of Prince Golitsin contains a good collection of paintings and MSS. The Shchukin Museum contains Russian antiquities, pictures and objects of industrial art. A number of excellent free libraries have been opened, two of them containing valuable collections of books and MSS. The remarkable Tretyakov gallery of pictures, chiefly of the Russian school, has been presented (1892) by its owner to the city. The philanthropic institutions include the vast foundling hospital (1764). The municipal relief of the poor was entirely reorganized in 1894, partly on the Elberfeld system and partly on quite new and original lines.

Moscow is surrounded by beautiful parks and picturesque suburbs. Of the former one of the most frequented is the Petrovsky Park, to the north-west, with a castle built in 1776, burnt by the French in 1812, but rebuilt in 1840. A little farther out is the Petrovsky Rayuzovskoye estate, with an agricultural academy (1865) and its dependencies (botanical garden, ornamental farms &c.). Another large park and wood surround an imperial palace (1796) in the village of Ostankino. The private estates of Kuziminski, Kuskovo and Kunisene are also surrounded by parks; the last has remains of a very old graveyard, supposed to belong to the pagan period. In the south-west, on the right bank of the Moskva, which here makes a great loop to the south, are the Vorobyevy hills, which are accessible by steamer from Moscow, and afford one of the best views of the capital. In the loop of the Moskva is situated the Novo-Dyevichy or Virgins' convent, erected in 1524 and connected with Sophia, sister of Peter the Great, and many events of Russian history. In the south, on the road to Serpukhov, is the village of Kolomenskoye, founded in 1327, a favourite residence of Ivan the Terrible and Peter the Great, with a church built in 1537, a striking monument of Russian architecture, restored in 1880. The monastery Nikolo-Ugryeshskiy, 12 m. from the city, between the Kursk and Ryazan railways, occupies a beautiful site and is much visited by Moscow merchants, to venerate a holy picture by which Dmitriy Donskoi is said to have been blessed before going to fight (1380) the Tartars at the battle of the Kalkan. The lakes are at the foot of hills, 1 sq. m., with its radial avenues and numerous summer residences, is the part of Moscow most frequented by the middle classes.

History.—The Russian annals first mention Moscow in 1147 as a place where Yuri Dolgoruky, prince of Suzdal, met Svyatoslav of Syeversk and his allies. The site was inhabited from a very remote antiquity by the Merya and Mordvinians, whose remains are numerous in the neighbourhood, and it was well peopled by Great-Russians in the 12th century. To the end of the 13th century Moscow remained a dependency of the princes of Vladimir, and suffered from the raids of the Mongols, who burned and plundered it in 1237 and 1293. Under Daniel, son of Alexander Nevsky (1261-1302), the prince of Moscow first acquired importance for the part he took in the wars against the Lithuanians. He annexed to his principality Kolomna, situated at the confluence of the Moskva with the Oka. His son in 1302 annexed Pereyaslavl Zalesky, and in the following year Mozhaisk (thus taking possession of the Moskva from its source to its mouth), and so inaugurated a policy which lasted for centuries, and continued, to the time of Solyomin by purchasing and other means of the neighbouring towns and villages. In 1300 the Kremlin, or fort, was enclosed by a strong wall of earth and timber, offering a protection to numerous emigrants from the
Tver and Ryazyan principalities. Under Ivan Kalita (1325-1341) the principality of Vladimir—where the princes of Kiev and the metropolitan of Russia had taken refuge after the wars that desolated south-western Russia—became united with Moscow; and in 1325 the metropolitan Peter established his seat at Moscow, thus giving new importance and powerful support to the young principality. In 1367 the Kremlin was enclosed within stone walls, which proved strong enough to resist the Lithuanians under Oliger (1368 and 1371). Kalita’s grandson, Dmitry Donskoy, annexed the dominions of Stanislaw and Rostov, and took part in the renowned battle of Kulikovo (1380), on the banks of the river of Kulikovka, where the Russians were the first time to oppose the Mongols, in a great pitched battle. Two years after the battle of Kulikovo Moscow was taken and plundered (for the last time) by Toktamish, khan of the Golden Horde of the Mongols.

The increase of the principality continued during the first half of the 16th century, and at the death of Vasili (or Basil) the Blind, in 1462, it included not only the whole of government of Moscow, but also large parts of the present governments of Kaluga, Tula, Vladimir, Nijni-Novgorod, Kostroma, Yaroslav, Veliki and Tver, which had been annexed by the reign (1462-1505) of Ivan III. That the prince of Moscow set up claims to other parts of Russia, and called himself “Ruler of all Russia.” In 1520 Moscow was said to contain 45,000 houses and 100,000 inhabitants. Ivan IV. annexed Novgorod and Pskov to Moscow, and subdued Kazan and Astrakhan. But after his reign Moscow suffered from a long series of misfortunes. In 1547 two conflagrations destroyed nearly the whole of the city, and a few days later the Tatar khan of the Crimea advanced against it with 100,000 men. He was compelled to retire from the banks of the Oka, but in 1571, taking advantage of the state into which Russia was brought by the extravagances of Ivan, he took Moscow and burned all the city outside the Kremlin. The gates of the Kremlin having been shut, thousands of people perished in the flames, and the annals record that of the 200,000 who then formed the population of Moscow, only 30,000 remained. In 1551 the Tatars of the Crimea were again in Moscow and avenged their repulse from the Kremlin on the inhabitants of the unfortified town. Meanwhile the political influence of the boyars had gradually increased. The peasants, who settled on their lands, or on the estates which the prince bestowed on his boyars, had become serfs; and the political tendency of the boyars, supported by the wealthiest middle classes (which had also a rapid development in the same century), was to become rulers of Russia, like the noblesse of Poland. During the reign of Feodor or Theodore (1584-1598), Boris Godunov, the regent, ordered the murder of the heir to the throne, Demetrius, son of Ivan IV., and himself became tsar of Russia. Moscow suffered severely in the struggle which ensued, especially when the populace rose and exterminated the Polish garrison, on which occasion the whole of the city outside the Kremlin was again burned and plundered. But in compensation it acquired in the eyes of the nation a greatly increased importance, as a stronghold against foreign invasions. The Novo-dyeveichy or Virgins’ nunnery, which the Poles besieged (1610) without taking, was invested with a higher sanctity. The city also by-and-by recovered its commercial importance, and this the more as other commercial cities were ruined, or fell into the hands of foreigners; and thirty years later Moscow was again a wealthy city. Owing, however, to the ever-increasing concentration of power in the hands of the tsar, and the steady development of autocracy, it lost much of its political importance, and assumed more and more, especially under Alexis Mikhailovich (1645-1676), the character of a private estate of the tsar, its suburbs becoming mere dependencies of his vast household.

During the whole of the 17th century Moscow continued to be the scene of many troubles and internal struggles. The people several times revolted against the favourites of the tsar, and were subdued only by cruel executions, in which the streltsy—a class of citizens and merchants rendering hereditary military service—supported the tsar. Afterwards appeared the raskol or nonconformist movement, and in 1648, when the news spread that Stenka Razin was advancing on Moscow “to settle his accounts with the boyars,” the populace was kept from rising only by severe repressive measures and by the defeat of the invader. Later on, the streltsy themselves engaged in a series of rebellions, which led the youthful Peter the Great to suppress them (1698) amid streams of blood. The opposition encountered at Moscow to his plans of reforming Russia according to his ideal of military autocracy, the conspiracies of the boyars and merchants, the distrust of the mass of the people, all compelled him afterwards to leave (1707) the city, a barefoot and naked, as his ancestors had done, a new capital. This he founded at St Petersburg on the very confines of the military empire he was trying to establish.

In the course of the 18th century Moscow became the seat of a passive and discontented opposition to the St Petersburg government. Peter the Great, wishing to see Moscow like other capitals of western Europe, ordered that only stone houses should be built within the walls of the town, that the streets should be paved, and so on; but his orders were only partially observed. In 1737 the Kremlin was restored. In 1759 the city became once more the prey of a great conflagration. The two others followed in 1748 and 1753, and gave an opportunity for enlarging some streets and squares. Catherine II. tried to conciliate the nobility, and applied herself to benefit the capital with new and useful buildings, such as the senate house, the foundlings’ and several other hospitals, salt stores, &c.

The last public disaster was experienced by Moscow in 1812. On the 15th of September, six days after the battle of Borodino, the Russian troops evacuated Moscow, and the next day the French occupied the Kremlin. The same night, while Napoleon was waiting for a deputation of Moscow notables, and received only a deputation of the rich raskolnik merchants, the capital was set on fire through the carelessness of its own inhabitants (it was no heroic deed of Rostochkin’s), the bazaar, with its stores of wine, spirits and chemical stuffs, becoming the prey of the flames. The inhabitants abandoned the city, and it was pillaged by the French troops, as well as by Russians themselves, and the burning of Moscow became the signal of a general rising of the peasants against the French. The want of supplies and the impossibility of wintering in a ruined city, continually attacked the French army, and Napoleon left Moscow on the 19th of October, after he had unsuccessfully attempted to blow up certain parts of the Kremlin.

(P. A. K.; J. T. Br.)

MOSEL (Fr. Moselle), a river of France and Germany, a left-bank tributary of the Rhine. It rises at an altitude of 2411 ft. on the west flank of the Voges, close to the Franco-German frontier, and a little N. of the Ballon d’Alsace. It flows first N.W. through the French department of Voges, then bends towards N. through that of Meurthe-et-Moselle, forms the Franco-German frontier for a short distance below Pagny, and enters Lorraine, where it is joined from the Sierck, which forms the frontier between the Rhine Province and Luxembourg. Then, turning N.E., it follows a sinuous course and reaches the Rhine at Coblenz. The principal towns on the banks of the Mosel are, in France: Remiremont, Épinal, Toul and Pont-à-Mousson; in Germany: Metz, Diedenhofen, Trier (Trèves) and Coblenz. The Mosel receives the waters of the Moselotte, Meurthe, Sarre and Saar (its principal tributary) on the right, and the Madon, Orne and Saucer on the left. Navigation for small vessels extends downwards from Fronard, a little below Nancy, the Mosel canal affording communication from a point above Metz to the frontier. In the lower part of the valley are the vineyards from which the well-known Mosel wines are produced. The valley of the Mosel, especially the part between Trier and Koblenz, is noted both for picturesque scenery and for many sites of antiquarian interest. The length of the river is 314 m.

MOSELLE-LINE, the designation of a line of French barrier forts (forts d’arrêt) on the upper Moselle between the fortresses
Moses (1780-1867), German poet and author, was born at Marieney in the Saxon Vogtland on the 8th of July, 1803. He studied law at Jena, and, after two years in Italy, at Leipzig. In 1834 he settled in Dresden as an advocate. He had meanwhile shown great literary promise by his Lied vom Ritter Wahl (1831). This was followed by the more philosophical Ahaiser (1838), and by a volume of poems, Gedichte (1836, 2nd ed., 1843), among which Andreas Hofer and Die letzten Zehn vom vierten Regiment have become popular. He wrote the historical plays Heinrich der Finkler (Leipzig, 1836), Cleopatra von Kleopatra, and Kaiser Otto III. (the four last being published in his Theater 1842), and a politico-historical novel, Der Kongress von Verona (1842), which was followed by a charming collection of short stories (Bilder im Moose, 1846). In 1844 Moses accepted the appointment of dramaturge at the Court Theatre in Oldenburg, but he was soon afterwards stricken with paralysis, and after remaining an invalid for many years, died at Oldenburg on the 10th of October 1867. Of his later works may be mentioned Die Dresdner Gemäldeliteratur (1849), and the tragedies Herzog Bernhard (1853) and Der Sohn des Vaterlandes (1859, with a collection of his works, Sämliche Werke, appeared in 8 vols. 1853; new ed., by his son, with a biography; 6 vols., 1880).

Moser, Johann Jakob (1701-1785), German jurist, was born at Stuttgart on the 18th of January 1701. He studied at the university of Tübingen, where, at the early age of nineteen, he was appointed extraordinary professor of law. In 1720 he became ordinary professor, and in 1736 he accepted a chair and directorship in the university of Frankfort-on-the-Oder. On account, however, of differences with King Frederick William I. of Prussia, he resigned the offices in 1759 and retired to Elberfeld, a village in the principality of Nassau, where for several years he devoted himself wholly to study, and especially to the production of his Deutsches Staatsrecht. In 1751 he was recalled to Würtemberg as district counsellor, and in 1759 was imprisoned at Hombriewil on account of the steps he had taken in connexion with this office against certain tyrannical proceedings of the duke. In 1764 he received his liberty and was restored to office. He died on the 30th of September 1785. Moser was the first to discuss in an adequate form the subject of European international law. He wrote more than 500 volumes, his principal work being Deutsches Staatsrecht (1737-1754), Neuere deutsches Staatsrecht (1766-1773), Deutsches Staatsarchiv (1751-1757), Grundriiss der heutigen Staatsverfassung von Deutschland (1754).

Moser, Justus (1720-1794), German publicist and statesman, was born at Osnabrück on the 14th of December, 1720. Having studied jurisprudence at the universities of Jena and Göttingen, he settled in his native town as a lawyer, and, from the confidence he inspired among his fellow citizens soon led to his being appointed advocatus patriae (state attorney). On the appointment of the duke of York (son of George III. of England) to the lay Protestant bishopric of Osnabrück, he was attached to the person of the new ruler as legal adviser, and continued in this office of trust for twenty years. From 1762 to 1768 he was justiziar (chief justice) of the criminal court in Osnabrück; and in 1768 he made Geheimer Referendar (privy councillor of justice). He died at Osnabrück on the 8th of January 1794.

Not only as a statesman and administrator, but also as a publicist, Moser occupied a leading position among the men of his time. His history of Osnabrück (1768; 2nd ed. 1780; 3rd ed. 1819) is a masterly work. In his Patriotische Phantasien (1775-1786; 2nd ed. by his daughter, I. W. J. von Voigts, 1847) he shows himself in advance of his times, pleading as he does for a national organic development of a state in the place of arbitrary laws imposed by the sovereign. His Vermischte Schriften (published by F. Nicolai with a biography, 1707-1758) also display a deep insight into human nature and sparkles with humour and witty satires. Moser was also a poet of some repute and wrote a tragedy, Arminius (1740). A statue of him by Drake was unveiled in Osnabrück in 1836.

His collected works, Sämliche Werke, were published by B. R. Abeken (10 vols., 1824-1844). See J. Kreysig, Justus Moser (1898), a Rupprecht Schwering's编写的传记; die katholische Anachronismen (1892); K. Mollenhauer, Mosers Anteil an der Wiederbelebung des deutschen Geistes (1896).

Moses (Gr. Μωσῆς, Mosēs), the great Jewish lawyer, prophet and mediator, and leader of the Israelites from Egypt to the eastern borders of the promised land. The records of his life and work are noticed in the articles Exodus, Numbers, Deuteronomy, where the several sources of the narratives are described. He appears in Midian at the "Mount of God" (Horeb) dwelling with its priest Jethro (q. e.), one of whose seven daughters he married, thus becoming the father of Gershom and Eliezer. Of his earlier life it was said that he was born in Egypt of Levite parents, and when the Pharaoh commanded that every newborn male child of the Hebrews should be killed, he was put into a chest and cast upon the Nile. He was found by Pharaoh's daughter, and his (step-)sister Miriam contrived that he should be nursed by her mother; on growing up he killed an Egyptian who was oppressing an Israelite, and this becoming known, sought refuge in Midian.

The story of the youth of Moses is, as is commonly the case with great heroes, of secondary origin; moreover, the circumstances of his birth as related in Exod. ii. find numerous parallels in legend elsewhere, e.g. in the story of the historical Sargon (L. W. King, Early Bab. Kings, ii. 87 sqq.), in the myths of Osiris and many others (see, at length, A. Jeremias's Das Alte Testament im Lichte desalten Orts, 1906, pp. 408 sqq.; Bab. im N. Testament, p. 30 seq.). The story of the adoption of Moses by the Egyptian princess appealed to later imagination (Josephus, Ant. ii. 9, 10; Acts vii. 20-22); and many fantastic fables grew up around this and the other biblical statements.

The name Mōshēh, explained by the fact that the princess "drew him" (mōshāh) out of the waters, means properly "one who draws"; a derivation from Eg. mes(u), "child," finds more favour, but is not certain.

At the holy mount, Moses received the divine revelation and was commissioned to bring the people a three-days' journey out of Egypt to sacrifice at this spot (Exod. iil. 12, 18; v. 3; viii. 24). The deity revealed himself in a new name, Yahweh, to the one who signs, and he orders Moses to take his task. On his return he experienced a remarkable incident which is obscurely associated with the rite of circumcision. The plagues which with the reluctant Pharaoh were coerced culminated in the destruction of all the first-born, and Israel escaped to the Red Sea. The pursuing Egyptians were drowned, and the miraculous preservation of the chosen people at the critical moment marks the first stage in the national history. (See Exodus, The.)

The other events need not be detailed. Kadesh (holy) was reached (Exod. iv. 24-26); it possibly explains the transference of the rite from the Negeb to the new-born son. For a remote passage see H. E. Smith, Journ. Bib. lit. (1906), pp. 14-24; and the article CIRCUMCISION in the Independent Review (1904, pp. 204-216).

2 The plagues appear to have been amplified. In Exod. iv. three signs are given: the hand of Moses is stricken with leprosy and restored (the sign for Moses); his rod becomes a serpent (cf. v. 8-13, the sign for Pharaoh); and the water is turned into blood (cf. v. 17). The Pharaoh still refuses to let his first-born son go out (iv. 21 sqq.). As regards the crossing of the Red Sea, a perfectly rationalizing explanation can be found: with a strong east wind a cloud of mist passed over the sea and the Israelites crossed (see Journ. Inst. Vict. xxvi. 28; xxvii. 268, 277). To the Israelites, however, it was a miracle, an unexpected intervention on the part of Yahweh, and one of the first marvels which he performed in the history of his people in order to rationalize this or any of the series misses the whole point of the religious history.
MOSES, ASSUMPTION OF

MOSES, ASSUMPTION OF, an extra-canonical apocalyptic work of the Old Testament. The Assumption or Ascension of Moses (Ἀράνθης Μωυσῆς) is a prophecy of the future relating to Israel, put into the mouth of Moses, and addressed to Joshua just before the great lawgiver died. Founded upon the book of Deuteronomy, it is brief and unpoetical. But it seems to have been large at first, for according to Nicephorus it consisted of 1,400 stichs. It contains a brief history of Moses from the Messianic age. The most striking feature in this work is the writer's scathing condemnation of the priesthood before, during, and after the Maccabean period, and an unsparring depreciation of the Temple services.

This book was lost for many centuries till a large fragment of it was discovered and published by Curtius in 1861 (Monumenta Chaldaica, p. 155-67). The work has been published in several parallel seq.). For the writer of the work, and for the time of its composition, see Engineers, p. 98. Much little was known about the contents of this book prior to this discovery. One passage found in this fragment is quoted in the Acta synod. Nicæae, ii. 18. Most of the other references relate to the strife of Michael and Satan about the body of Moses, and ascribes to it the Ascension Mosis, i.e., Αράνθης Μωυσῆς.

Various other works have been attributed to Moses, such as the Patroia Moshe, the Bijdók νῶν μούσσικον Μωσέων, the Exordios of Moses of Chaldea, etc., but these are of little interest.

The book known as The Assumption of Moses recognizes animal sacrifices and cherishes the Messianic hope. He was not a Sadducee, for he looks forward to the establishment of the Messianic Kingdom (x.). Nor yet was he a Zealot, for the quietistic ideal is upheld (ix.), and the kingdom is established by God Himself (x.). He was clearly a Pharisaic Quietist, a Pharisee of a fast disappearing type, recalling in all respects the Chasid of the early Maccabean times, and upholding the old traditions of quietude and resignation. His object is to protest against the growing secularization of the Pharisaic party through its adoption of popular Messianic beliefs and political ideals. But his own system of views, together with the apocalyptic contemplation, were the result of the Pharisaic movement culminated in due course in the fall of Jerusalem.

The Latin Version a Translation from the Greek.—That our Latin text is derived from the Greek there can be no question. Thus Greek words are translated, as "ch’edrio" from κέδρος, "heremus" from ἥρεμος; Greek idioms are reproduced, as "usque nos necuptum." The translation of the Greek is frequently necessary in order to correct the misunderstandings of the translator or the corrections already inherent in the Greek. Finally, H. W. W. and the other translators are in a position to recognize the original of the Greek as it is now found. The Greek is a translation from the Hebrew.—That the Greek was in turn derived from a Semitic original was denied by Hilgenfeld, Volkmar and others. But Ewald, Schmidt-Merx, Colani, Carrière, Haseloff, Hengstenberg, Gressmann, Delitzsch, and all like scholars and interpreters agree that the translation from a Semitic. R. H. Charles (op. cit. xxxviii.-xlv.) is of opinion that it is possible to prove that the Greek goes back not to an Aramaic but to a Hebrew original, on the following grounds: (1) Hebrew

BIBLIOGRAPHY.—See further articles, AARON; DECALOGUE; HEBREW RELIGION; LEVITES. For the introductory questions, W. Robertson Smith, Hur and the Modern World (Eng. 1905). In the field of litt. most helpful; see also J.-M. Lagrange, Hist. Crit. of the Old Testament (Eng. E. Myers, 1905), pp. 148-179. Weilhessen's

1 See K. Budde, Religion of Israel to the Exile, ch. 1. According to Gen. iv. 26, so far from the name Yahweh having been made known to Israel by Moses (Exod. iii. 13 sqq., vi. 2 sqq.), the worship goes back to the earliest ages.
idiotic phrases survives in the text. Thus circumspect (ii. 7) = "I will protect," i.e. *Zecharia* (cf. Deut. xxviii. 10), and in sancta vocabantur ei lepices salutantes, wey Kessy by (cf. 1 Chron. xxiii. 14., and Isa. xiv. 2.), "they will call themselves priests." (2) Frequently it is of no use to recognize the original corruptness in the text. (3) In some cases we must translate not the Latin but the Hebrew presupposed by it. Thus in i. 7, successor *diaskeusen* (v. t. *Ezra* cattles, cattales), is rendered "Testament," the "Assumption," to which almost all the patriotic references and that of Jude are made, was subsequently edited. Some views of Author.—Our author's views on Moses are remarkable. He emphasizes, above all, Moses' role in preparing the foundation from before the foundation of the world to be the mediator of God's covenant with his people (i. 14, iii. 12). During his life he was Israel's intercessor with God (xi. 11, 17). Praying on their behalf as a "great angel" (xi. 17). a "sacred spirit who was worthy of the Lord manifold and incomprehensible" (xii. 16). Apparently his relation to history did not cease with death, as he was to be their intercessor in the spiritual world (xii. 6). His death was an ordinary one (i. 15, iii. 13, x. 12), but no single place was worthy to mark the place of his burial, for his sepulcher was from the rising to the setting sun, and from the south to the confines of the north. In the whole world was his sepulcher (xi. 31). "The losses our authors have suffered are allied to Old Testament conceptions rather than to the rabbinic doctrine of man's righteousness, which bulks so largely in Jewish literature. The righteousness as involving merit over against God, our author represents the greatest hero of Israel as declaring "Not for any virtue or strength of mine, but in His compassion and long-suffering was He pleased to call me" (xxi. 7). Literature.—Editions of the Latin text: Cenari Monumenta sacra et profana, i. i. 55-64 (1861); Hilgenfeld, Nov. test. extra canonicam, ii. 28-32, and the last edition of the text was by Schnurr, Mose Propheete and Himmelfahrt (1867); Schmidt and Merx, Die Assumpit Mosex (Merx, Arch. f. wissensch., Erf. des A. T. p. ii. 111-152; 1868); Charles, The Assumption of Moses (translation, with notes and introduction) (1867); Kautzsch's and Piesse, ii. 531- 331. Critical inquiries.—For a full account of these see Schnürer iii. 222; Charles op. cit. xxii.-xxviii. (R. H. C.)

MOSES OF CHORENE, Armenian historian, was a native of Khorr'n in Taron, a district of the Armenian province of Turberan. According to the History of Armenia which bears his name he was a pupil of the two fathers of Armenian literature, the patriarch or bishops Sahak the Great and the Mesrob. His name has been written in groups to Alexandria to study the Greek language and literature, and thus prepare himself for the task of translating Greek writings into Armenian. Moses took his journey by Edessa and the sacred places of Palestine. After finishing his studies in the Egyptian capital he set sail for Greece; but the ship was driven by contrary winds to Italy, and he seized the opportunity of paying a flying visit to Rome. He then visited Athens, and towards the end of winter (440) arrived in Constantinople, whence he set out on his homeward journey. On his arrival in Armenia he found that his patrons were both dead. The History of Armenia speaks of his author as an old, infirm man, constantly engaged in the work of translating. In the later Armenian tradition we find other notices of this celebrated man—such as, that he was the nephew of Mesrob, that he was publicly complimented by the emperor Marcian, that he had been ordained bishop of Bagrewand by the patriarch Glut, and that he was buried in the church of the Apostolic Cloister at Mush in the district of Taron; but these accounts must be received with great caution. This remark applies especially to the statement of Thomas Arsruni,* that Moses, like his. uncle, was murdered, and died at the age of 130 years, and reared his own death in a fourth book of his great work. The same caution must be extended to another tradition, based on an arbitrary construction of a passage in Samuel of Ani, which places his death in the year 489.

The History of Armenia, or, as the more exact title runs, the

Genealogical Account of Great Armenia, consists of three books, and reaches down to the death of Saint Mesrob, in the second year of Yazgeder (II. 17, 1460). It is dedicated to Sahak Bagratuni (who was afterwards elevated to the throne of Armenia, the year 481), as the man under whose auspices the work had been undertaken. This work, which in course of time acquired canonical authority among the Armenians, is partly compiled from sources which we yet possess, viz. the Life of Saint Gregory by Agathanghelos, the Armenian translation of the Syriac Doctrine of the Apostle Addai, the Antiquities and the Jewish War of Josephus, and above all the History of Mar Abas Katina (still preserved in the extract from the book of Schelo), who, however, did not write it in Syriac, but in Greek, at Nisibis, about 131 B.C., but was a native of Armenia. It is cited in Syriac alone about A.D. 358, or shortly thereafter. Besides these, Moses refers to a whole array of Greek authorities, which were known to him from his constant use of Eusebius, which he could not possibly have related all that he makes them relate. Although Moses assures us that he is going to rely entirely upon Greek authors, the contents of his work show that it is mainly drawn from native sources. He is chiefly indebted to the popular ballads and legends of Armenia, and it is to the use of such materials that the wealth of his work is chiefly to be traced. The value for the history of religion and mythology is, in truth, very considerable, a fact which it is the great merit of Emini and Dulaurier* to have first pointed out. For political history, on the other hand, it is of much less value than was formerly assumed. In particular, it is not a history of the people of the or of the country, but a history of the Armenian aristocracy, and, in opposition to the Maimonidean tendency which pervades the rest of the older Armenian historical literature, it is written in the most typical form of the rival Bagrationiun. Down to the 3rd century it is proved by the contemporary Graeco-Roman annals to be utterly untrustworthy—but even for the times of Armenian Christianity it must be used far more cautiously than has been done, for example, by Gibbon. The worst feature is the confusion in the chronology, which, strange to say, is most hopeless in treating of the contemporaries of Moses himself. What can be thought of a writer who assigns to Yazgeder I. (399-420) the eleven years of his predecessor Bahram IV., and the twenty- one years of Yazgeder I. to his successor Bahram V. (430-439)? A. von Gutschmid,* at one time attempted to explain this unhistorical character of the narrative from a tendency arising out of the peculiar ecclesiastical and political circumstances of Armenia, situated as it was between the eastern Roman and the Persian empires, circumstances which were substantially the same in the 5th as they were in the two following centuries. In the course of further investigations, however, he came to the conclusion that, besides the many false statements which Moses makes about his authorities, he gives a false account of himself. That is to say, the author of the History of Armenia is not the venerable translator of the 5th century, but an Armenian writer under his name during the years between 634 and 642. The proof is furnished on the one hand by the geographical and ethnographical nomenclature of a later period of MSS. of Etchmiadzin and Jerusalem are given by Agop Garinian, Tilisii (1858), 4to. The book has been edited and translated by Whiston (London, 1736, 4to.), and by Le Valliant de Florival (Paris, 1841-1842 2 vols. 8vo).

The commencement of this king's reign has been fixed by Noldeke (Geschichte der Sassaniden aus Tabari, p. 433) as 4th August, 418; and this date has subsequently been submitted to documentary evidence from the fact of the martyrdom of Pethion (see Hoffmann, Aussige aus syrischen Akten persischer Mahrter, p. 13).

* Translated in Langlois, i. 195 seq.

For the following statements, the evidence may be found in the article "Ueber die Glaubwürdigkeit der Armenischen Geschichten des Moses von Chorene," by A. von Gutschmid, in the Zeitschrift für phil. histor. Classe der königl. sächs. Gesellschaft der Wissenschaften (1876), p. 1 seq.

* Ueber die Glaubwürdigkeit," Sc., p. 8 seq.
and similar anachronisms, which run through the whole book and are often closely incorporated with the narrative itself, and on the other hand by the identity of the author of the *History* with that of *Geography*, no point on which all doubt is excluded by a difference in literary affinities, not to speak of the similarity in geographical terminology. The critical decision as to the authorship of the *History* must get settled for the *History* also.

The *Geography* is a meagre sketch, based mainly on the *Chorographia* of Pappus of Alexandria (in the end of the 4th century), and indirectly on the work of Ptolemy. Only Armenia, the Persian Empire, and the neighbouring regions of the East are independently described from local information, and on these sections the value of the little work depends. Since the first published text contains names like "Russians" and "Crimea," Saint Martin in his edition denied that it was written by Moses, and assigned its origin to the 10th century. It was shown, however, by L. Indijdijéen that these are interpolations, which are not found in better manuscripts. And in fact it is quite evident that a book which gives the division of the Sassanid Empire into four spahibships in pure old Persian names cannot possibly have been composed at a long interval after the time of the Sassanids. But of course it is equally clear that such a book cannot be a genuine work of Moses of Khor'ni; for that division of the empire dates from the early part of the reign of King Chosroes I. (531-579). Accordingly K. P. Facknlov, to whom we are indebted for the best text of the *Geography*, is of opinion that we have in it a writing of the 7th century. If the limits within which the *Geography* was composed are to be more nearly defined, we may say, that from isolated traces of Arab rule (which in Armenia dates from 651), it must have been written after that year, and perhaps about the year 657.

Another extant work of Moses is a *Manual of Rhetoric*, in ten books, dedicated to his pupil Theodorus. It is drawn up after Greek models, in the taste of the rhetoric and sophistry of the later imperial period. The examples are taken from Herogenes, Theon, Aphthonius, and Libanius; although the author is also acquainted with lost writings—e.g., the *Pelioides* of Euripides. On account of the divergence of its style from that of the *History of Armenia*, Armenian scholars have hesitated to ascribe the *Rhetoric* to Moses of Khor'ni; but, from what has been said above, this is rather to be regarded as a proof of its authenticity.

The following is the text of a letter, called the *Letter to Sahak Arderuni;* the History of the Holy Maker of God and her Image (in the cloister of Hogsotvanch in the district Andzevatsi of the province of Vaspurakan), which is also addressed to Sahak; and the *Panegyric on Saint Rhiopism*. Of the sacred poems attributed to him, there is only one short prayer, contained in the hymnal of Sharakan, which can really claim him as its author.

Of works passing under the name of Moses of Khor'ni, the following are regarded by the historians of Armenian literature as spurious: a *History* (distinct from the *Panegyric*) of the wanderings of Saint Rhiopism and her Companions; a *Homily on the Transfiguration of Christ*; a *Discourse on Wisdom* (i.e., the science of grammar); the *Commentaries on grammar* (an exposition of Dionysius Thrax). In the case of the grammatical work, however, it has been suggested that there may have been some confusion between Moses of Khor'ni and a Moses of Suniich, who lived in the 7th century.

**Literature.**—The date of the History of Moses has been discussed in many monographs. See especially the brochure of A. Carrière, *Nouvelles sources de Moïse de Karhoun* (Vienna, 1853), which sets it in the 5th century. A Russian critic, K. Khalevits, arrives at a similar conclusion in his *Armenianische Papst* (Oespikon, 1869). F. C. Cypere, in an article on "The date of Moses of Khoroun," in the *Byzantinische Zeitschrift*, vol. 2, and in a second in vol. 4, entitled "The true Moses of Khoroun," doubts the historical probity of Carrière's arguments, and contends that the History of Moses is a late 5th century work, much interpolated in the immediately succeeding centuries. (A. v. G.; F. C. C.)

**MOSHEIM, JOHANN LORENZ VON** (c. 1694-1755), German Lutheran divine and Church historian, was born at Lübeck on the 9th of October, 1694 or 1695. After studying at the gymnasium of his native place, he entered the university of Kiel in 1712, where he took the degree of doctor of theology in 1716, and became assessor in the philosophical faculty at Kiel. His first appearance in the field of literature was in a polemical tract against John Toland, *Vindiciae antiquae christianorum disciplinarum* (1720), which was soon followed by a volume of *Observationes sacras* (1721). These works, along with the reputation he had acquired as a lecturer and preacher, secured for him a call to Helmstädt as professor ordinarius in 1723. The *Institutionum historiae ecclesiasticae* (4 vols., 1726), and in the same year he was appointed by the duke of Brunswick the abbot of Marienthal, to which dignity and emolument the abbacy of Michaelehain was added in the following year. Mosheim was much consulted by the authorities when the new university of Göttingen was being formed; especially in the framing of the statutes of the theological faculty, and the provisions for making the theologians independent of the ecclesiastical courts. In 1747 he was made chancellor of the university. He died at Göttingen on the 9th of September. Among his other works were *De rebus christianorum ante Constantium commentarii* (1753), *Ketter-Geschichte* (2nd ed. 1748, and *Sittenlehre der heiligen Schrift* (1735-53). His exegetical writings, characterized by learning and good sense, include *Cogitationes in N. T. loc. select. (1726)*, and expositions of 1 Cor. (1741) and the two Epistles to Timothy (1755). In his sermons (Heilige Reden) considerable eloquence is shown, and a mastery of style which justifies the position he held as president of the German Society.

There are two English versions of the *Institutes*, that of Archibald Macdaine, published in 1764, and that of James Murdoch (1832), which is more correct. Murdoch's translation was revised and re-edited by James Seaton Reid in 1848, and by H. L. Hastings in 1892 (Boston). An English translation of the *De rebus christianorum* was published by Murdoch in 1841.

**MOSLER, HENRY** (1841— ), American artist, was born at New York, on the 6th of June 1841, the family removing to Cincinnati when he was about ten years old. Studying drawing under himself, he became a draughtsman for a comic paper, the *Omnibus* (Cincinnati), in 1855; in 1859-1861 he studied under James H. Beard, and in 1862-63, during the Civil War, was an art correspondent of *Harper's Weekly*. In 1863 he went to Düsseldorf, where for almost three years he was at the Royal Academy schools; he subsequently went to Paris, where he studied for a short time under Ernest Hébert. His "Le Retour,"
from the Paris Salon of 1879, was the first American picture ever bought for the Luxembourg. He received a silver medal in Paris 1880, and gold medals at Paris, 1888, and Vienna, 1893. Examples of his work are in the Sydney Art Museum, N.S.W., and the art museums of Springfield, Mass., Cincinnati, Ohio and New York. His son, GUSTAVE HENRY MOSLER (1875-1906), a pupil of his father and of Léon Bonnat, exhibited at the Salon in Paris, receiving a medal for his "De Profundis" in 1891; his portrait of Governor J. W. Stewart is in the State House, Montpelier, Vermont, and his "Empty Cradle" is in the Toledo Art Club.

MOSQUE (through Fr. mosquée; Span. mezquita, from Arab. masjid, sajada, to adore), the house of prayer in the

The earliest mosque erected was that at Mecca, which consisted of a great court, in the centre of which was the Ka'ba or Holy Stone. The court was surrounded with arcades, all of which constituted the prayer chamber, so that its plan is necessarily different to the normal type; the existing buildings date only from the first half of the 17th century, as the whole mosque was destroyed by a torrent in 1626.

The normal type referred to is best represented in the mosque of 'Amr (see 'AMR-IBN-EL-ASS) at Fostat, Cairo; built in A.D. 643 it still retains its original arrangement, though partly rebuilt and increased in its dimensions. The mosque (see fig. 1), now in a somewhat ruined condition, covers an area of about 130,000 sq. ft. with an open court, 240 ft. sq., and a sanctuary or prayer chamber, 106 ft. deep, there being a central avenue and ten aisles on either side. The columns and capitals were all taken from ancient buildings, Egyptian, Roman and Byzantine, and they carry arches of different forms, semicircular, pointed and horseshoe.

The columns and other materials of the mosque of el-Aksa at Jerusalem were taken by Abdalmalik (A.D. 690) from the ruins of Justinian's church of St Mary on Mount Zion, and the central avenue or nave built with them presents the appearance of a Christian church; it however runs north and south, the Mecca niche being at the south end; originally there were seven aisles on each side, now reduced to three. The Kubbat-es-Sakhr, or Dome of the Rock, at Jerusalem, is only a shrine erected over the sacred rock, so that the title often ascribed to it as "the mosque of Omar" is misleading.

The mosque of the Omayyads in Damascus was built by the Caliph Hishâm in A.D. 705 on the foundations of the basilican church of St John: its plan differs therefore from the normal type in that its arcades run east and west, and the transept in the centre becomes the prayer chamber. The Mecca niche is sunk in the doorway of a Roman temple which formerly occupied the same site, and the substructure of the minaret at the south-west angle is of still more ancient date. The great court on the north side has a lofty cloister round it, so that in many respects it follows the normal type.

The mosque of 'Abd Allah bin Tulun, in Cairo (A.D. 879), is the first mosque erected in which the materials were not taken from ancient buildings; it has therefore a special interest as being the earliest genuine example of the Mahommedan style (see ARCHITECTURE: Mahommedan). The walls, piers and arches, are all built in brick, covered with stucco, a great portion of which is preserved down to the present day. The plan is of the normal type, with a great court in the centre, a prayer chamber four aisles deep on the Mecca side (south-east), and a double aisle on the other three sides. All the arches are pointed and slightly horseshoe, preceding therefore by about two and a half centuries the introduction of the pointed arch into Europe. The pillars carrying the arches have shafts at their angles, the earliest examples known, and the decoration of the walls consists of friezes, borders, and impost-bands, all enriched with conventional patterns interwoven with cufic characters and modelled in stucco. The windows in the outer walls are filled with pierced stone screens of geometrical design. The architect is said to have been a Coptic Christian who deprecated the destruction of ancient buildings to obtain columns and blocks of stone, and who undertook to design a mosque which should be built entirely in brick, which when coated with stucco and appropriate decorative designs would rival its predecessors.

The next important mosque is that of Kairawan in Tunisia, which was founded by Sidi Okba in A.D. 675, but was partly rebuilt and added to in the following two centuries. Its court covers an area of 38,000 sq. ft., and its prayer chamber is 150 ft. deep, having a central avenue and eight aisles on each side.

The chief interest of the mosque at Kairawan lies in its being the prototype of the great mosque at Cordova, which was built by Abdarrahman in A.D. 786; the earliest portion of the mosque is 120 ft. deep), which is in front of the entrance gateway to the great court, and consists of a central avenue with five aisles on each side. In A.D. 961 this
portion was extended 150 ft. in the rear by Hakim II., the mihrab and Mecca wall being rebuilt; about 20 years later a further enlargement was made, and eight more aisles were added along the whole eastern side, so that the prayer chamber covered an area of over 148,000 sq. ft. In the 13th century a portion of Hakim's addition was pulled down to make way for the first cathedral, which was dedicated to the Virgin. The most beautiful portion of the mosque, however, still exists in the prayer chamber of Hakim, where are to be found the earliest examples of the cusped arch and the origin of many of the geometrical patterns in stucco at the Alhambra.

The mosque of el Azhar, "the splendid," was begun about A.D. 970 by Jaubhar, the general of the Fatimite Caliph Moiz, who captured Fostat and founded el Kahira, the present town of Cairo. It was based, therefore, on the great mosque at Kairawan, and although more or less rebuilt, it still preserves its original plan. It has a special interest in being the chief university of the Moslem world, containing some thousands of students (mujawirin), for whom certain parts of the mosque (riwaq) are screened off, according to the country from which they come. Thus special parts are reserved for natives of the various provinces of Egypt, of Morocco, Syria, Arabia, India, Turkey, &c. Each student can, if he is too poor to hire lodgings, live, eat and sleep in the mosque. Each has a large chest in which to keep his clothes and books; these are piled against the walls to a height of seven or eight feet. The students pay no fees, but the richer ones give presents to the lecturers, who sit on the matting in various parts of the sanctuary or cloister, while the students sit round each lecturer in a circle. The usual course of study lasts for three years, though some students remain for much longer. The chief of the lecturers, called the Sheik el-Asfar, receives about £100 a year, the others little or nothing, as regular pay. The Koran, sacred and secular law, logic, poetry, arithmetic, with some medicine and geography, are the chief subjects of study.

Of other mosques in Cairo, the finest is that of Sultan Hasan (fig. 2), completed in A.D. 1360. It differs from the normal type in many respects, as it includes residences for various sects, so that portions of it, with the several storerooms externally, resemble an immense mansion or warehouse, and this would seem to have led to an important change inside, as instead of a cloister of two or more aisles there are four immense halls all covered with pointed barrel vaults. Beyond the Mecca wall is the tomb of the founder, covered with an immense dome.

The entrance doorway on the north-east side is over 80 ft. in height, its summit being decorated with stalactite vaults, one of the grandest features in Mahommedan architecture, only equalled by the magnificent portals of the mosques in India. The central square court, of moderate dimensions, with halls and great recesses, is followed in other examples in Cairo, among which the Tomb Mosque of Kait-Bey (c. A.D. 1470) is the most graceful (fig. 3). In this case the central court is roofed over, and has an octagon lantern in the centre; the recesses are covered with horizontal ceilings carried in arch. The whole being elaborately carved, coloured and gilded; the tomb is covered with the later type of dome, built in stone, and elaborately carved outside with delicate conventional patterns in relief.

Although the conquest of Syria by the Arabs took place in A.D. 641 there are no remains of mosques there earlier than the 13th century, and the oldest example at Tabriz is evidently, as far as its plan is concerned, a copy of a Byzantine church, departing entirely therefore from the normal plans. The great mosque at Isfahan, built by Shah Abbas the Great (1585-1629), has one great court (225 ft. by 170 ft.) and two smaller ones, all with fountains in them. The prayer chamber is a lofty structure, quite unlike those of Egypt and Kairawan, with a dome 75 ft. in diameter and halls on each side divided into two aisles, each compartment being covered with a dome, in this respect also not following the early normal type, in which domes were only found over tombs.

The mosques of Constantinople are all copies more or less of S. Sophia: they have courts in front with a range of arcades round, and the centre portion forms the prayer chamber, the side aisles serving as passages. The central dome has but a slight elevation outside, but with the numerous cupolas round, and the minarets, it forms a picturesque group which is wanting in the mosques of Kairawan, Cordova, and other examples in North Africa.

In India as in other countries the Mahommedans took possession of the ancient buildings and adapted them to their religious requirements. The materials of the native styles of India, however, did not lend themselves to their utilization as in Syria, Egypt and North Africa, where the columns and capitals formed the substructure of the arcades which surrounded their courts. In the earliest mosque at old Delhi, they adopted the piers and bracketed capitals of the Jaina builders, whom they probably employed to build their mosque. They, however, had no confidence in the arch, which, as the Hindu says, "never sleeps but is always tending to its own destruction," so that the pointed arch, which had almost become the emblem of the Mahommedan religion, had to be dispensed with for the covered aisles which surrounded the great court, and in the triple entrance gateway the form of an arch only was retained, as it was constructed with horizontal courses of masonry for the haunches, and with long slabs of stone resting one against the other at the top. A similar construction was employed in the great mosque at Ajmere, built A.D. 1200-1211 at the same time as the Delhi mosque. The objection to the arch is more clearly shown.

1 It is very generally held that this "Blue Mosque" dates only from the 15th century (see Tabriz).
in the entrance gateway of the Lal Darwaza or Red Gate mosque at Jaunpur, where an arch (of two rings of ogive shape) is carried by a solid wall, built under it, which is pierced with three doorways with bracket-capitals and architraves, returning therefore to trabecated construction. The covered aisles of the court of the Jumma Musjid at Jaunpur are in three storeys with piers, bracket-capitals and architraves, bearing therefore no resemblance to the arcades of Kairawan and Cordova, and constituting a different style. There is however one feature which throughout the Mahommedan mosques in India is always found, viz. the dome. But this also in India is built in horizontal courses, so that the form only and not the construction of the Cairenc domes is followed. The chief peculiarity of the mosques at Ahmedabad is that, as the style progressed, it became more Indian; in the Jumma Musjid (A.D. 1420) and the Queen’s mosque at Mirzapur, the pointed arch exists only in the façades of the prayer chambers; in the mosques built 30 to 40 years later the whole is constructed without a single arch, all the pillars have bracket-capitals, and the domes, which are of very slight elevation, are all built in the trabecated style. As a contrast to the Ahmedabad mosques, the Kadam Rasul mosque at Gaur in Bengal possesses some characteristics which resemble those of the mosque of Tulun in Cairo, possibly due to the fact that it is entirely built in brick, with massive piers carrying projecting windows.

The climax of Mahommedan work in India is reached in that of the Mogul emperors at Agra, Delhi and Fatehpur-Sikri, in which there is a very close resemblance in design to the mosques of Syria, Egypt, and Persia; the four-centred arch, which is in the Mogul style, finds general acceptance, and was probably derived from Persian sources. The mosque at Fatehpur-Sikri possesses in its great southern gateway, built by Akbar in the second half of the 16th century, the masterpiece of Indo-Saracenic architecture. As a rule, the mosques of India followed the normal plan, with a great central court and aisles round and a prayer chamber in front of the Mecca wall, which in India is always at the west end.

(R.P. S.)

MOSQUITO (Span. mosquito, a gnat, diminutive of mosca, a fly), a term originally applied to many species of small blood-sucking Diptera (q.v.), belonging to various families, but now by common consent restricted to those known to naturalists as Culicidae, or gnats. Before the year 1809 mosquitoes had never been collected systematically, and had received little notice from entomologists, so that but few genera and comparatively few species were known. Although it had long been suspected that these insects were in some way connected with malaria and other diseases, while the species now called Stegomyia calopus was the carrier of yellow fever had been ascertained by Finlay as early as 1881, it was not until the closing years of the 19th century that the brilliant researches of Ross in India, and of Grassi and others in Italy, directed the attention of the whole civilized world to mosquitoes as the exclusive agents in the dissemination of malarial fever. The result has been that in subsequent years mosquitoes have been collected, studied and described by naturalists and medical men in all parts of the globe. Nearly 100 genera and about 700 species of mosquitoes are now recognized, but in all probability the total number of species is not less than 1000.

In general appearance mosquitoes resemble many harmless midges (Chironomidae), but may be distinguished by the following characters. (1) The prolongation of the lower lip or labium into a prominent proboscis, which in the female sex contains the full complement of piercing organs found in blood-sucking Diptera, namely paired mandibles, paired maxillae, a tubular tongue (or proboscis (the common outlet of the salivary glands)), and an upper lip or labrum. (2) The presence of variously tufted scales on the body and its appendages: the head is clothed with scales, the thorax with hairs or scales, and the abdomen with either hairs or scales, or both; the legs and veins of the wings are always covered with scales, and the palpi are often (as in some Anophelines) conspicuously scaly. (3) The fact that the costal or marginal vein runs completely round the wing. The wings exhibit six longitudinal veins (seven in Hepialaphlebomyia), two of which are characteristically forked. The antennae, usually small, are of two shapes; in the female they are all connected with the mouthparts, and in the male may be curved (as in Megarhinus) or otherwise modified in shape.

In dividing the Culicidae into genera reliance is placed chiefly upon characters derived from the scales on the three divisions of the body and on the wings. A fairly satisfactory attempt at grouping the genera has been made by Lutz (1904), who divides the family into the first place into the Baeulicidae, with a piercing proboscis (i.e. ordinary mosquitoes), and the Culicimorphae or forms without a piercing proboscis (Mochlomyia, Corethra, &c.). It has since been proposed to treat the Culcimorphae as a distinct family, under the name of Maculidae, in which it is probable that Lutz’s scheme will meet with general acceptance. The Euculicidae are divided into the Asiphoninae (=Anophelines), the larvae of which have no respiratory siphon, and the Siphoninae, or forms in which a respiratory siphon is present in the larval state. The divisions of the Siphoninae are the Ankylorhynchae (genera with curved proboscis, e.g. Megarhinus and Toxorhynchites) and Orthorhynchae (genera with straight proboscis). The latter again are divided into Metanotrichae (in which the metathorax or region of the thorax is bare) and Metanotrichae (in which the metathorax is clothed with bristles or scales). The Metanotrichae are made up of the sub-families Culicinae (Culex, &c.) and Hepialaphlebomyia and Microplacae [palpi short in both sexes; sub-families Aedinae (Aedes, &c.) and Haemagoginae (Haemagogus, Uranotaenia, &c.); the Metanotrichae are divided on the basis of the palpal characters into two groups, the Heteroplaeae or Heliconinae (Joblotia, Rhyynchomyia, &c.) and Microplacae or Dendromyiinae (Weyomyia, Soletius, Limatus, &c.).

The old genus Anophelines (characterized by the palpi being long in both sexes) is now divided into a number of genera according to the character and shape of the scales on the different regions of the body and on the wings. These genera make up the sub-family Anophelineae, and together include over 100 species. The genus Culex, from which the family takes its name, though it has been similarly split up, is still in its restricted sense larger than any one of some 200 species are combined in it alone.

Mosquitoes are found in all parts of the world. Even within the Arctic Circle they are in many localities abundant and excessively bloodthirsty during the short summer. Under such conditions the deeply-rooted nature of the blood-sucking instinct is most remarkable; for insects whose ancestors for many generations may not have tasted blood will seek for it with the utmost keenness and persistency so soon as an importunate appetite ebbs the naturally phytophagous, and the vast majority, at any rate, appear to be capable of continuing to exist and reproducing their kind upon a purely vegetarian diet. As a rule the blood-sucking habit is confined to the females, but in the case of a few species it is said to be common to both sexes. The thirst for blood is stimulated by heat, and in temperate climates it is only during hot weather that mosquitoes are troublesome. Some species of mosquitoes, such
as the common gnat (Culex pipiens), are rarely found away from human habitations; others seldom or never enter houses, but are met with either in more or less open country, or in the recesses of forests and woods. In Europe and North America the continued existence of species is ensured by the hibernation of impregnated females, or else the winter is passed in the egg or occasionally in the larval state. In tropical climates with a well-marked dry season mosquitoes pass into a semi-dormant condition during the period when there is little water in which to deposit their eggs. Culicidae are by no means confined to low-lying districts, and have even been met with in the Himalayas at an altitude of 13,000 feet. The wide distribution of certain species is undoubtedly attributable to the agency of ships and trains; under natural conditions mosquitoes seldom travel far from their breeding grounds, although the powers of flight of some species are greater than has been supposed.

The preliminary stages of all mosquitoes are passed in water, either fresh or salt, stagnant or slightly moving. The nature of the breeding-place varies greatly according to the species, and while many of the mosquitoes that infest houses will breed even in the smallest accidental accumulation of water such as may have collected in a discarded bottle or tin, the larvae of other species less closely associated with man are found in natural pools or ditches, at the margins of slow-moving streams, in collections of water in hollow trees and bamboo-stumps, or even in the water-receptacles of certain plants. The eggs are usually deposited on the water surface, and while in the case of certain species, such as Culex pipiens or the widely distributed C. fatigans, they are agglutinated together in masses known as "boats" or "rafts" containing from 50 to 400 ova, those of others, such as the Anophelinae and many Culicinae (e.g. Stegomyia culex), are laid separately. The larvae are active and voracious little grub-like creatures (known in the United States as "wrigglers"), with large heads and jaws provided with a pair of brushes, which sweep food-particles into the mouth. Their food consists of minute animal and vegetable organisms, and lie almost horizontally at the surface; they frequently appear as though anchored by the tail to a weed or other object, and possess the curious faculty of completely rotating the head so as to browse on the surface film. Mosquito pupae are comma-shaped (see fig. 1), and breathe by means of a pair of respiratory trumpets or gills on the abdomen.

The majority of mosquitoes are dull in hue, but certain species are brilliantly coloured or conspicuously banded or spotted with white. The Anophelinae have narrow bodies, and generally spotted wings, and when at rest keep body and proboscis in a straight line, often at a considerable angle with the supporting surface; in this way they can be distinguished from Culicinae, which have a humped-up thorax with which the proboscis forms an angle, and in the resting position keep the body parallel to the support.

The disseminators of malaria are exclusively Anophelinae, but even among these it is only certain species that are dangerous, since the others appear to be incapable of acting as hosts of the parasites. Stegomyia culex, on the other hand, a very widely distributed species and the almost certain carrier of yellow fever, belongs to the Culicinae. In the case of filariasis due to Pilaria bancrofti, which is common throughout the Tropics, the embryos of the parasite are disseminated by various Culicinae and Anophelinae (Culex pipiens in Queensland; C. fatigans in the West Indies; Myzomyia rossii in India; Pyreophorus costalis in a large portion of tropical Africa, &c.). Six or seven species of mosquitoes are also the intermediate hosts of Pilaria immittis, which infests the right auricle and pulmonary artery of the dog, and occurs throughout the tropics, in southern Europe, the United States of America, and elsewhere. There is reason to believe that malaria, yellow fever and filariasis are not the only diseases disseminated by mosquitoes.

(E. E. A.)

MOSQUITO COAST AND RESERVE (Mosquitia or Reserva Mosquitá), a division of the republic of Nicaragua, officially styled the department of Zelaya. Pop. (1909), about 15,000. Although its name is sometimes applied to the whole eastern seaboard of Nicaragua—and even to Mosquitá in Honduras, i.e. the coast region as far west as the Rio Negro or Tinto—the Mosquito Coast is more accurately defined as a narrow strip of territory, fronting the Caribbean Sea, and extending from about 11° 45' to 14° 10' N. It stretches inland for an average distance of 40 m., and measures about 225 m. from north to south. In the north, its boundary skirts the river Wawa; in the west, it corresponds with the eastern limit of the Nicaraguan highlands; in the south, it is drawn along the river Rama. The chief towns are Bluefields or Blewfield, Magdalena on Pearl Cay, Prinzapolca on the river of that name, Younta near the mouth of the Cuculua, and Gualaca on the Rio San Juan near the mouth of the San Juan River (valley about 2000) is the capital and the largest town. It is the seat of a Moravian mission, and has a good harbour, with regular steamship services to Greytown in Nicaragua, and to New Orleans. It exports bananas and other fruit.

The Mosquito Coast is so called from its principal inhabitants, the Misskito Indians, whose name was corrupted into Mosquit by European settlers and has been entirely superseded by that form except in the native dialects. The Mosquito Indians, of whom there are several tribes, are an unusually intelligent people, short of stature and very dark-skinned. Their colour is said to be due to intermarriage with shipwrecked slaves.

The first white settlement in the Mosquito country was made in 1630, when the agents of an English chartered company—of which the earl of Warwick was chairman and John Pym treasurer—occupied two small cays, and established friendly relations with the Indians. From 1635 to 1850 Great Britain claimed a protectorate over the Mosquito Indians; but little success attended the various endeavours to plant colonies, and the protectorate was disputed by Spain, the Central American republics, and the United States. The opposition of the United States was due very largely to the fear that Great Britain would acquire a privileged position in regard to the proposed interoceanic canal. In 1848, the seizure of Greytown (San Juan del Norte)
by the Mosquito Indians, with British support, aroused great excitement in the United States, and even involved the risk of war. But by the Clayton-Bulwer Treaty of 1850 both powers pledged themselves not to fortify, colonize or exercise dominion over any part of Central America; and in November 1859 Great Britain delegated its protectoare to Honduras. This caused great dissatisfaction among the Indians, who shortly afterwards revolted; and on the 28th of January 1860 Great Britain and Nicaragua concluded the treaty of Managua, which transferred to Nicaragua the suzerainty over the entire Caribbean coast from Cape Gracias a Dios to Greytown, but granted autonomy to the Indians in the more limited Mosquito Reserve (the area described above). The local Indians accepted this change on condition that he should retain his local authority, and receive a yearly subvention of £1000 until 1870. But on his death in 1864 Nicaragua refused to recognize his successor. The reserve nevertheless continued to be governed by an elected chief, aided by an administrative council, which met in Bluefields; and the Indians denied that the suzerainty of Nicaragua connoted any right of interference with their internal affairs. The question was referred for arbitration to the emperor of Austria, whose award published in 1866, upheld the contention of the Indians, and thereby confirmed the suzerainty of Nicaragua over the reserve, but not their right of self-government. After enjoying almost complete autonomy for fourteen years, the Indians voluntarily surrendered their privileged position, and on the 20th of November 1894 their territory was formally incorporated in that of the republic of Nicaragua, as the department of Zelaya.

Moss, a seaport of Norway, in Smaalenene amt (county), on the east coast of Christiania Fjord, 37 m. S. of Christiania, near the Gothenburg railway. Pop. (1900), 8041. Here was signed, on the 14th of August 1814, the convention which united Norway to Sweden. Timber and wood pulp are chief exports, grain and coal are imported. The port affords 13 to 22 ft. of water beside the quays.

Mossamedes, a town of Portuguese West Africa, capital of the district of Mossamedes, on the south side of Little Fish Bay (Bay of Mossamedes or Angra do Negro). Pop. about 5000. The harbour affords excellent anchorage. A railway (over 100 m. long) starts from the harbour and crosses the semi-desert coast region to the fertile Chella plateau. Mossamedes is the headquarters of an important fishing industry (see La Geographie, March 1908).

Mossel Bay, the name of a bay, town and division of the Cape province, South Africa. The bay lies midway between Table Bay (Cape Town) and Port Elizabeth roadstead. Like most of the South African bays it does not afford good anchorage. Westward, however, it is sheltered by Cape St Blaize, on which is a lighthouse. The town lies on the west side of the bay, Cape St Blaize stretching beyond to the S.E. Mossel Bay is 250 m. by sea and 312 m. by rail. E. by S. of Cape Town. Pop. (1904), 4500. The port ranks fourth in importance among the seaports of the Cape and does a large forwarding trade. Vessels load and discharge by means of lighters. Mossel Bay is a station on the direct Cape Town—Port Elizabeth railway. The Mossel Bay division of the province has an area of 707 sq. m., and a population (1904) of 17,700, of whom 49% were whites.

Mossop, Henry (1729-1774), Irish actor, was born in Dublin, and made his first stage appearance there, at the Smock Alley Theatre, as Zanga in Young's tragedy, The Revenge, in 1749. His first London appearance was made in 1751 under Garrick's management, as Richard III. He returned to Ireland in 1759, and, playing with Barry, added to his laurels, but when he attempted management on his own account, he ruined Barry completely, and, in despair, attempted suicide, dying in poverty on the 27th of December 1774.

Most, John [Joseph] (1846-1906), German-American anarchist, was born in Augsburg, Bavaria, on the 5th of February 1846. He was apprenticed to a bookbinder, worked at this trade in Germany, Austria, Italy and Switzerland in 1863-1868, and then became a writer of Socialist pamphlets and periodicals, and editor of Socialist sheets in Chemnitz and Vienna, both suppressed by the authorities, and of the Freie Presse in Berlin, being repeatedly sent to prison. He was an ardent propagandist of the anarchist and conventional religions, and for his gospel of terrorism, preached in prose and in many songs such as those in his Proletarier-Liederbuch (5th ed., 1875). Some of his experiences in gaol were recounted in Die Bastille am Plätzen: Bäcker aus meinem Gefängniss-Tagebuch (1876). In 1874-1878 he was a member of the German Reichstag, but he failed to be re-elected, was expelled by the Socialist organization, went to France but was forced to leave in 1879, and then settled in London. There he founded the "red" organ—it was printed in red—Die Freiheit, in which he expressed his delight in June 1881 over the assassination of Alexander II. of Russia and for this was imprisoned for a year and a half. He then resumed the publication of Die Freiheit in New York. He was imprisoned in 1886, again in 1887, and in 1902, the last time for two months for publishing after the assassination of President McKinley an editorial in which he argued that it was no crime to kill a ruler. He died in Cincinnati on the 17th of April 1906. See his Memoires (New York, 1903).

Mostaganem, chief town of an arrondissement in the department of Oran, Algeria, 44 m. E.N.E. of Oran, on a plateau 278 ft. high, half a mile from the Mediterranean coast. The town is separated into European and native quarters by a deep ravine, the Ain Sefra, through which passes a considerable railway (see La Geographie, March 1908). The town is in the Department of Alger, and is separated from the capital, Mostaganem, by the Mustagane plain. Mostaganem is the largest town in the country, and is the chief town of the department. The town is on the road from Oran to Constantine, and is the terminus of a railway from Constantine. The town is surrounded by a wall, and is supplied with water from a spring. The town is on the road from Oran to Constantine, and is the terminus of a railway from Constantine. The town is surrounded by a wall, and is supplied with water from a spring.

Mostar, the capital of Herzegovina, situated 87 m. S.W. of Sarajevo, on the river Narenta, and on the railway from Sarajevo.
MOSUL—MOTANABBI

to Ragusa. Pop. (1900), about 14,500 including the garrison. Mostar is the seat of Roman Catholic and Orthodox bishops, a district court, and an Austrian garrison. Half Turkish, half Italian in character, it commands the gateway through which all heavy traffic of the Dardanelles passes. A single arch of great beauty, 80½ ft. in span, and 61 ft. high, leads to the Roman Catholic quarter, on the right bank of the river. This bridge has been the theme of many legends, and its origin has been much debated. Probably it was built by the Turks, in the 15th or 16th century, after Italian designs; but some antiquaries ascribe its foundation to the Romans. Since 1881, when an iron bridge was opened, its use has been confined to foot passengers. Mostar possesses a gymnasium, a school of viticulture, and a massive Orthodox cathedral.

The present name of the city has been derived from the Serbo-Croatian most, a bridge, and star, old. Its earlier Slavonic name was Viniricha. Whether it may be identified with Pons Vetus, Andrelantium, Bistuea, Saloniana, or Sarsenterum, it certainly dates from Roman times. Mostar was enlarged in 1440 by Radivoi Gost, mayor of the palace to Stephen, first duke of St Sava. Immediately on their conquest of Herzegovina it was chosen by the Turks as their headquarters. The environs of the city are interesting. Within a few miles are the sources of the Buna, a small affluent of the Narenta, which issues from a cave at the foot of Podvežek, amid scenery celebrated for its wild grandeur.

MOSUL, a town of Mesopotamia, capital of a Turkish vilayet and sanjak of the same name, on the right bank of the Tigris, in 36° 35′ N., 43° 3′ E. Pop. 40,000 (Moslems 31,500, Christians 7,500). In Mosul, as in Bagdad, only part of the space between the walls is occupied by buildings; the rest is occupied by cemeteries; even the solid limestone walls of the ancient town are half in ruins, being serviceable only in the direction of the river, where they check inundations. Of the town gates at present in use, five are on the south, two on the west, two on the north, and the great bridge gate on the east. Leaving Mosul by the last named, the traveller first crosses a stone bridge, 157 ft. long; then a kind of island (140 ft.), which is overhauled only in spring and summer by the Tigris; next a stretch of the river which, at such times as it is not fordable, is spanned by a bridge of boats, the bridge proper covering only one sixth of the space. The town is famous for its gardens, the growth of low water excellent vegetables, particularly water-melons, are grown upon the islands and dry portions of the river-bed.

The interior of Mosul has an insignificant appearance, only a few of the older buildings being left, among which may be mentioned the Great Mosque, with its leaning minaret, formerly a church dedicated to St. Paul. The streets are for the most part badly paved and very narrow, a small square in the marketplace, overlooked by airy coffee-booths, being almost the only open space. The shops are few and poor. The industry in comparison with former times, when the town had so considerable a manufacture in muslin as to give its name to that fabric, is very unimportant; trade also, which is almost exclusively in the hands of native merchants, has fallen off greatly, although the town remains the collecting and distributing centre for the north Mesopotamian desert and Kurdistan. The exports and most of the imports pass through Bagdad. Mostar is the meeting-place of roads from Aleppo, Diarbekr, Bitlis, north and west Persia and Bagdad; and it is on the projected line of railway from Constantinople to the Persian Gulf. Gall nuts, gathered on the neighboring Kurdish mountain slopes, are mostly exported, but are also made use of by native dyers; and hides, wax, cotton and gum are sold. Christians and Moslems have lived together on better terms here than elsewhere. Both are animated by an active local patriotism, and both honour the same patron saints, Jirjis (St. George) and Jonah; the grave of the latter is pointed out on an artificial mound on the left bank of the Tigris.

The language of the people of Mosul is a dialect of Arabic, partly influenced by Kurdish and Syriac. The Moslems call themselves either Arabs or Kurds, but the prevalent type, very different from the Arab or the Arabized of Bagdad, proves the Aramaean origin of many of their number. Of the Christians the community of the Chaldaeans, i.e. those who have gone over from Nestorianism to Catholicism, seems to be the most important; there are also Syrian Catholics and Jacobites. Mosul has for several centuries been a centre of Catholic missionary activity, the Dominicans especially, by the foundation of schools and printing-offices, having made a marked impression upon an intelligent and teachable population. There are very few Protestants. The town is the seat of British, French and Russian consulates.

Mosul shares the severe alternations of temperature experienced by upper Mesopotamia. The summer heat is extreme, and in winter frost is not unknown. Nevertheless the climate is considered healthy and agreeable; copious rains fall in general in winter. The drinking water is got from the muddy Tigris. At the north-east corner of the town is a sulphur spring, and 4 leagues to the south there is a hot sulphur spring (Hamamât 'Ali), much frequented by invalids.

Mosul probably occupies the site of a southern suburb of ancient Nineveh (q.v.) but it is very doubtful whether the older Musul and the Musal of the Arabized, who is usually called Al-Mausul (Arab., "the place of connexion"); it is, however, certain that a town with the Arabic name Al-Mausil stood here at the time of the Moslem conquest (636 A.D.). The town reached its greatest prosperity towards the beginning of the decline of the caliphate, when it was for a time an independent capital. The dynasty of the Hamanidhs reigned in Mosul from 934, but the town was conquered by the Syrian Ouluids in 900. In the 11th century it belonged to the Seljuks, and in the 12th, under the sway of the Atabegs, particularly of Zenki, it had a short period of splendour. Saladin besieged it unsuccessfully in 1182. The Persians occupied Mosul for a short time (1623); it fell soon afterwards, recovered by sultan Murad IV. The government of the pashalik was long hereditary in the originally Christian family of the 'Abd-al-Jalil, until the Porte, during the course of the 19th century, succeeded after a long and severe contest in establishing a more centralized system of government.

The Vilayet of Mosul lies mainly east of the Tigris. It is divided into three sanjaks, Mosul, Shehrizore and Suleimanieh, and has an area of 29,000 sq. m. Pop. 295,000 (Moslems 245,000, Yezidis 15,000, Christians 30,000 and Jews 5000). In 1835, Lord Byron, the poet, visited Mosul (C. Parry, Tigris; 1844). A map of the town accompanies J. Cernik's paper, "Studienexpedition durch die Gebiete des Euphrat und Tigris," in Ergänzungsheft No. 45 of Petermanns Mitteilungen (Gottingen, 1876); Parry, Six Months in a Syrian Monastery (1845); E. Sachau, Am Euphrat und Tigris (Berlin, 1899); Baron von Oppenheim, Vom Mittelmeer zum Persischen Golf (Berlin, 1900).

MOSZKOWSKI, MORITZ (1854– ), Polish musical composer, was born at Breslau, and studied at Dresden and Berlin. He started as a pianist, and had a great success at the chief European centres. He was made a member of the Berlin Academy in 1895. In 1897 he settled in Paris. He became a prolific composer both for piano and orchestra, but is best known by his Spanish dances, written for four hands on the piano, and his waltzes. His opera Boabdil was performed at Berlin in 1892.

MOTALA, a town of Sweden, in the district of Lön of Östergötland, on the east side of Lake Vetter at the outflow of the river Motala, 175 m. S.W. by W. of Stockholm by rail. Pop. (1900), 3047. It is on the Göta canal route (q.v.). The town was founded in 1880, but the Motala mechanical works, 2 m. east, were founded in 1823 by the Göta Canal Company under the direction of Daniel Fraser, an Englishman. Iron war-ships, railway locomotives, iron bridges, machinery, &c. are built; the company has branches in Norrköping, Gothenburg, and elsewhere.

MOTANABBI, strictly AL-MUTANABBÎ (Abû-T-TAYYİB AHMAD IBN AL-ḤUSAYN OF KUFA) (516/9-695), the most famous represent-
c. 1 e. "he who plays the prophet."
MOTET—MOTHER

tative of the last period of Arabic poetry, was the son of a water-carryer, and is said to have picked up much of the literary knowledge for which he was afterwards famous by haunting the book-stalls of his native city. He spent too, some years of his youth among the nomads of the Syro-Arabian desert, learning their purer dialect, and becoming familiar with very coarse customs. Thus he grew up a brave proud man, a gallant warrior as well as a poet, not easily satisfied either with wealth or honours, indifferent to the Korâan and to the fasts and prayers of Islam, but untainted by the looseness of morals common to the poets of those days. At first he essayed a perilous road to distinction, appearing in the character of a prophet in the desert between the Euphrates and Syria, where he formed a considerable party, but was arrested by the governor of Emesa (Homs). A prison coat of humility. The name of al-Mutanabbi clung to him, however, and is that by which he is still commonly known. Regaining his liberty, he had to struggle for a time with poverty and neglect. But his poetical talents at length found him patrons, and in 948 he became attached to the court of the famous warrior and patron of letters, Saif ad-daaulâ, prince of Aleppo, to whom many of the best fruits of his muse were dedicated, and by whose side he approved his valour in the field. But he had rivals who knew how to inspire jealousy between him and the prince, and an angry scene with the grammarian Khalâwân, in which the latter closed a philological dispute by striking Mutanabbi, in the presence of the prince and without rebuke from him, led the poet to leave the court and seek a new career in the realm of the Ishkids (957). He now took as his patron and the object of his eulogies Kâfur, the regent of Egypt—a black eunuch who knew how to open the poet's lips by great gifts and honours. Mutanabbi, however, sought a higher reward, the government of Sidon, and at length broke with Kâfur, wrote satires against him, and had to fly for his life to Kufa (961). His next great patron was 'Aodh ad-daaulâ of Shiraz, and on a journey from Shiraz to Kufa he was waylaid and slain by a chief of the Asad, whose kinsfolk he had satirized (965).

The poetry of Mutanabbi is to European taste much less attractive than the verses of the ancient Arab poets, being essentially artificial and generally unreal, though it has great technical merits and displays lively fancy and considerable inventive power.

Oriental taste places him on a very high pedestal, as may be judged from the fact that more than forty commentaries were written on his Divân (H. Khal., iii. 306). Dieterici's edition of the poet (Berlin, 1858-81), gives the commentary of Wâhidî (d. 1075); the Egyptian edition of 1870 has the commentary of 'Ukbârî (d. 1197). A convenient edition of his work was the commentary of Nâšîr ul-Vazîj at Beirut (1882). See R. A. Nicholson, A Literary History of the Arabs (London, 1907), pp. 304-313.

MOTET, a musical art-form of paramount importance in the 16th century. The word is of doubtful etymology, and probably various uses and forms in the 13th and 14th centuries connect with more than one origin. Thus motilus suggests modius or melody; and probably represents the notion underlying the use of the term motets or motelles to designate one of the middle parts in a vocal composition. On the other hand the origin of the word may be found in the Latin word motetto (diminutive of motto) with the French mot (in the sense of bon mot) is in conformity with the use of a profane art-form contemporary with the conductus and rondel of these early epochs of music.

The only really definite and mature art-form denoted by the word motet is that of the 16th-century pieces of ecclesiastical music in one or two (more rarely) continuous movements, for the most part on Biblical or other ecclesiastical prose texts. The word is, however, used for any single Latin-text composition in continuous form, not yet sectional by verse, and not forming a permanent part of the mass. Thus Palestrina's Stabat mater is included among his motets; though the text is metrical and rhymed, and the style, though continuous, is far from being that of the typical polyphonic motet. The title of motet is also occasionally loosely used for non-ecclesiastical works, such as many of the numbers in the Magnum opus musicum of Orlando di Lasso and the dedicatory motet at the beginning of Palestine's fifth book. And in this way it is sometimes applied to compositions not to Latin text; as in Josquin's Déploration de Jehan Ockenheim, where all except the cantus firmus is in French.

The most important kind of motet is that which is intimately connected with the solemn mass for a particular holy day. Such motets are sung between the Credo and the Sanctus of the mass. They are, in typical cases, founded on the Gregorian tones of their texts, and the mass is founded on the same themes, thus giving the whole service a musical unity which has never since been approached in any church music even under Bach. When a motet was not founded on Gregorian tones it was still possible for the composer to design a mass on the same themes, and most of the titles of 16th-century masses, when they do not indicate a secular origin, indicate either the motet or the Gregorian tones on which they are founded. Thus Palestrina's masses Assumpta est Maria; O admirabile commercium; Dum complerentur; Hodie Christus natus est; Dies sottificatus; Venti sponsa Christi, and the second Missa Tu es Petrus, are magnificent examples selected almost at random from the masses which the composer has founded on his own motets of the same name. When such masses are performed, whether in a concert- or church, it is indisputable that the motet ought always to be included. Sometimes one composer founded a mass on another composer's motet; thus Soriano's fine Missa, Nos autem gloriari, is based upon a motet by Palestrina. When a motet was in two movements the second movement almost always ended with the last clauses of the first, both in text and in music, thereby producing a distinctly modern impression of da capo form.

In later times the term motet is little more than a name for any choral composition of clearly single design; and the fact that the term motet has been sung, the 15th-century motet, between the Credo and Sanctus, is a High Mass, has nothing to do with their character as an art-form. Bach's motets are great German choral works in several movements, with no written accompaniment, though there is internal and external evidence that they were accompanied from score by the organ. Handel's motets belong to his Italian period and are simply Latin cantatas of various kinds, with instrumental accompaniment. The later meanings attached to the word are quite indefinite, and have no common idea, except that the motet is nowadays the shortest kind of sacred choral work. For MOTH, in entomology, any lepidopterous insect belonging to the division Heterocera, as distinguished from the Rhopalocera, or butterflies; formerly confined to the small nocturnal insect (belonging to the genus Bynea), which breeds in fur, clothes, &c. (see LEPIDOPTERA). The word in O Eng. is mofye, and corresponds to Ger. Moelle.

MOTHER, the term for the female parent of a child. The word, like father, is common to Indo-European languages, cf. in Teutonic languages, Ger. Mutter, Du. moeder, Swed. and Dan. moder; Gothic is the exception in Teutonic languages, the word being aitik, cf. atik, father; from Lat. mater come, in Romanic, Fr. mère, Ital., Span. and Port., madre. Greek has μητρα (Attic and Ionic), μηρπ (Doric). The Russian word is mat. The Sansk. mate points to an original derivation from a stem ma, to measure, or make. Of the many transferred applications of "mother" may be mentioned those to the church, to nature, to the earth, and to a city or nation, as the parent of other cities, nations, colonies, &c. As a title "mother" is particularly applied to the head of a religious community of women, or "mother-of-pearl" see PEARL. There is a particular application of "mother" to the scour which rises to the surface of a liquor during the process of fermentation, and also to a mass of gummy stringy consistency formed in vinegar in the process of acetous fermentation, hence known as "mother of vinegar" (see VINEGARS). This is usually, however, taken to be another word altogether, and connected with Du. moeder, mud, mire.
MOTHERWELL, W.—MOTION, LAWS OF

MOTHERWELL, William (1707–1835), Scottish poet, antiquary and journalist, was born at Glasgow on the 13th of October 1707, the son of an ironmonger. At the age of fifteen he was apprenticed in the office of the sheriff-clerk at Paisley, and apprenticed sheriff-clerk depute there in 1819. He spent his leisure in collecting materials for a volume of local ballads which he published in 1819 under the title of *The Harp of Renfrewshire*. In 1827 he published a further installment in *Minstrelsy Ancient and Modern*, prefaced by an excellent historical introduction. He contributed verses to newspapers and magazines. *Jeanie Morrison*, *My Heid is like to rend, Willie*, and *Wearie's Cœuld Well* being his best-known poems. He became editor of the *Paisley Advertiser* in 1828, and of the *Glasgow Courier* in 1830.

A small volume of his poems was published in 1832, and a larger volume with a memoir in 1846, reissued, with additions, in 1848.

MOTHERWELL, a municipal and police burgh of Lanarkshire, Scotland. Pop. (1851), 9000; (1901), 30,418. It is situated near the right bank of the Clyde, 13 m. S. E. of Glasgow by the Caledonian railway. It takes its name from an old well dedicated to the Virgin, and owes its rapid increase to the coal and iron mines in the neighbourhood. It has large iron and steel works, bridge-building being a distinctive industry. Boilers, steam-crane and ironmongers' ware are also made, and there are tile and fireclay works. The public buildings include the town-hall, theatre and hospital; the park was presented in commemoration of Queen Victoria's Jubilee.

**Motion** (Lat. *movere*, to move), in English law, an application made to a court during the progress of an action, and in which the party seeking judgment is entitled to state that the matter in dispute is the subject of a previous motion. Any motion made in open court and founded on a written statement. Motions are either motions of course or special motions. A motion of course is made *ex parte* without notice, and is not mentioned in court, the party being entitled as of right. Motions of course are confined to the chancery division of the High Court. A special motion is made in open court, and must be supported by proper evidence. Special motions are made either *ex parte* or *ad partes*. On all *ex parte* applications the utmost good faith must be observed. *Ex parte* motions, in the king's bench division, are usually made to a divisional court. A motion for judgment is a proceeding whereby a party to an action moves for judgment of the court in his favour. See *Rules of the Supreme Court*, Ors. xi., lii.

**Motion, Laws of.** Before the time of Galileo (1564–1642) hardly any attention had been paid to a scientific study of the motions of terrestrial bodies. With regard to celestial bodies, however, the case was different. The regularity of their diurnal revolutions could not escape notice, and a good deal was known 2000 years ago about the motions of the sun and moon and planets among the stars. For the statement of the motions of these bodies uniform motion in a circle was employed as a fundamental type, combinations of motions of this type being constructed to fit the observations. This procedure—which was first employed by the great Greek astronomer Hipparchus (2nd century B.C.), and developed by Ptolemy three centuries later—did not afford any law connecting the motions of different bodies. Copernicus (1473–1543) employed the same system and greatly simplified the application of it, especially by regarding the earth as rotating and the sun as the centre of the solar system. Kepler (1571–1630) was led by his study of the planetary motions to reject this method of statement as inadequate, and it is in fact incapable of giving a complete representation of the motions in question. In 1609 and 1610 Kepler published his new laws of planetary motion, which were subsequently shown by Newton to agree with the results obtained by experiment for the motion of terrestrial bodies.

The earliest recorded systematic experiments as to the motion of falling bodies were made by Galileo at Pisa in the latter years of the 16th century. Bodies of different substances were employed, and slight differences in their behaviour accounted for by the resistance of the air. The result obtained was that any body allowed to fall from rest would, in a vacuum, move relatively to the earth with constant acceleration; that is to say, would move in a straight line, in such a manner that its velocity would increase by equal amounts in any two equal times. This result is very nearly correct, the deviations being so small as to be almost beyond the reach of direct measurement. It has since been discovered, however, that the magnitude of the acceleration in question is not exactly the same at different places on the earth, the range of variation amounting to about 1/4%. Galileo proceeded to measure the motion of a body on a smooth, fixed, inclined plane, and found that the law of constant acceleration along the line of slope of the plane still held, the acceleration decreasing in magnitude as the angle of inclination was reduced; and he inferred that a body, moving on a smooth horizontal plane, would move with uniform velocity in a straight line if the resistance of the air, and friction due to contact with the plane, could be eliminated. He went on to deal with the case of projectiles, and was led to the conclusion that the motion in this case could be regarded as the result of superposing a horizontal motion with uniform velocity and a vertical motion with constant acceleration, the latter identical with that of a merely falling body; the inference being that the path of a projectile would be a parabola except for deviations attributed to contact with the air, and that in a vacuum this path would be accurately followed. The method of superposition of two motions may be illustrated by the case of a body dropped from the mast of a ship moving at uniform speed. In this case it is found that the body falls relatively to the ship as if the latter were at rest, and alights at the foot of the mast, having consequently pursued a parabolic path relatively to the earth.

The importance of these results, limited though their scope was, can hardly be overrated. They had practically the effect of suggesting an entirely new view of the subject, namely, that a body uninfluenced by other matter might be expected to move, relatively to some base or other, with uniform velocity in a straight line and that, when it does not move in this way, its acceleration is the feature of its motion which the surrounding conditions determine. The acceleration of a falling body is naturally attributed to the presence of the earth; and, though the body approaches the earth in the course of its fall, it is easily recognized that the conditions under which it moves are only very slightly affected by this approach. Moreover, Galileo recognized, to some extent at any rate, the principle of simple superposition of velocities and accelerations due to different sets of circumstances, when those are combined (see Mechanics). The results thus obtained apply to the motion of a small body, the rotation of which is disregarded. When this case has been sufficiently studied, the motion of any system can be dealt with by regarding it as built up of small portions. Such portions, small enough for the position and motion of each to be sufficiently specified by those of a point, are called "particles."

Descartes helped to generalize and establish the notion of the fundamental character of uniform motion in a straight line, but otherwise his speculations did not point in the direct line of sound progress in dynamics; and the next substantial advance that was made in the principles of the subject was due to Huygens (1629–1695). He attained correct views as to the character of centrifugal force in connexion with Galileo's theory; and, when the fact of the variation of gravity (Galileo's acceleration) in different latitudes first became known from the results of pendulum experiments, he at once perceived the possibility of connecting such a variation with the fact of the earth's diurnal rotation relatively to the stars. He made experiments, simultaneously with Wallis and Wren, on the collision of hard spherical bodies, and his statement of the results (1665) included a clear enunciation of the conservation of linear momentum, as demonstrated for these cases of collision, and apparently correct in certain other cases, mass being estimated by weight. But Huygen's most important contribution to the
subject was his investigation, published in 1673, of the motion of a rigid pendulum of any form. This is the earliest example of a theoretical investigation of the motion of rigid bodies. It involved the adoption of a point of view as to the relation between the motions of bodies of different forms, which practically amounted to a perception of the principle of energy as applied to the case in question.

We owe to Newton (1642-1727) the consolidation of the views which were current in his time into one coherent and universal system, sometimes called the Galileo-Newton theory, but commonly known as the "laws of motion"; and the demonstration of the fact that the motions of the celestial bodies could be included in this theory by means of the law of universal gravitation. A full account of his results was first published in the Principia in 1687.

Such statements as that a body moves in a straight line, and that it has a certain velocity, have no meaning unless the base, relative to which the motion is to be reckoned, is defined. Accordingly, in the extension of Galileo's results for the purpose of a universal theory, the establishment of a suitable base of reference is the first step to be taken. Newton assumed the possibility of choosing, as a base such that, relatively to it, the motion of any particle would have only such divergence from uniform velocity in a straight line as could be expressed by laws of acceleration dependent on its relation to other bodies. He used the term "absolute motion" for motion relative to such a base. Many writers on the subject distinguish such a base as "fixed." The name "Newtonian base" will be used in this article. Assuming such a base to exist, Newton admitted at the outset the difficulty of identifying it, but pointed out that the key to the situation might be found in the identification of forces; that is to say, in the mutual character of laws of acceleration as applied to any given body and any other by whose presence its motion is influenced. In this connexion he took an important step by distinguishing clearly the character of "mass" as a universal property of bodies distinct from weight.

There can be no doubt that the development of correct views as to mass was closely connected with the results of experiments with regard to the collision of hard bodies. Suppose two small smooth spherical bodies which can be regarded as particles to be brought into collision, so that the velocity of each, relative to any base which is unaffected by the collision, is suddenly changed. The additions of velocity which the two bodies receive respectively, relative to such a base, are in opposite directions, and if the bodies are alike their magnitudes are equal. If the bodies though of the same substance are of different sizes, the magnitudes of the additions of velocity are found to be inversely proportional to the volumes of the bodies. But if the bodies are of different substances, say one of iron and the other of gold, the ratio of these magnitudes is found to depend upon something else besides bulk. A given volume of gold is found to count for this purpose for about two and a half times as much as the same volume of iron. This is expressed by saying that the density of gold is about two and a half times that of iron. In fact, experiments upon the changes of velocity of bodies, due to a mutual influence between them, bring to light a property of bodies which may be specified by a quantity proportional to their volumes in the case of bodies which are perceived by other tests to be of one homogeneous substance, but otherwise involving also another factor.

The product of the volume and density of a body measures what is called its "mass." The mass of a body is often loosely defined as the measure of the quantity of matter in it. This definition correctly indicates that the mass of any portion of matter is equal to the sum of the masses of its parts, and that the masses of bodies alike in other respects are equal, but gives no test for comparison of the masses of bodies of different substances; this test is supplied only by a comparison of motions. When, as in the case of contact, a mutual relation is perceived between the motions of two particles, the changes of velocity are in opposite directions, and the ratio of their magnitudes determines the ratio of the masses of the particles; the motion being reckoned relative to any base which is unaffected by the change. It is found that this gives a consistent result; that is to say, if by an experiment with two particles A and B we get the ratio of their masses, and by an experiment with A and a third particle C we get the ratio of the masses of B and C, and thus the ratio of the masses of A and C, we should get the same ratio by a direct experiment with A and C. For the numerical measure of mass that of some standard body is chosen as a unit, and the masses of other bodies are obtained by comparison with this. Masses of terrestrial bodies are generally compared by weighing; this is found by experiment to give a correct result, but it is applicable only in the neighbourhood of the earth. Familiar cases can readily be found of the perception of the mass of bodies, independently of their tendency to fall towards the earth. The mass of any portion of matter is found to be permanent under chemical and other changes, and this fact adds to its importance as a physical quantity. The study of the structure of atoms has suggested a connexion of mass with electrical phenomena which implies its dependence on motion; but this is not inconsistent with the observed fact of its practical constancy, to a high degree of accuracy, for bodies composed of atoms.

The Galileo-Newton theory of motion is that, relative to a suitably chosen base, and with suitable assignments of mass, all accelerations of particles are made up of mutual (so-called) actions between pairs of particles, whereby the two particles forming a pair have accelerations in opposite directions in the line joining them, of magnitudes inversely proportional to their masses. The total acceleration of any particle is that obtained by the superposition of the component accelerations derived from its association with the other particles of the system severally in accordance with this law. The mutual action between two particles is specified by means of a directed quantity to which the term "force" is appropriated. A force is said to act upon each of two particles forming a pair, its magnitude being the product of mass and component acceleration of the particle on which it acts, and its direction that of this component acceleration. Thus each mutual action is associated with a pair of equal forces in opposite directions. Instead of the operation of superposing accelerations, we may compound the several forces acting on a particle by the parallelogram law (see Mechanics) into what may be called the resultant force, the total acceleration of the particle being the same as if this alone acted. The theory depends for its verification and application upon the fact that forces can be identified and classified. They can be recognized by Application of the Theory. their reciprocal character, and it is found to be possible to connect them by permanent laws with the recognizable physical characteristics of the systems in which they occur. A generalization of Galileo's results takes the form that under constant conditions of this kind, force (defined in terms of motion) is constant, and that the superposition of two sets of conditions, if their independence can be secured, results in superposition of the forces associated with them separately. Particular laws of force may be suggested by a study of the simplest cases in which they are manifested, and from them results may be obtained by calculation as to the motions of systems of any given structure. Such results may be tested by direct observation.

It should be noted that, within a limited range of application to terrestrial mechanics, the most convenient way of attacking the question of the relations of forces to the physical properties of their occurrence may be by balancing their several effects in producing motion; thus avoiding in the first instance both the choice of a base and the consideration of mass. This procedure is useful as a preliminary step in the study of the subject. It does not, however, afford a convenient starting-point for a general theory, because it is apt to involve some confusion of phenomena which, from the point of view of the Galileo-Newton theory, are distinct in character.

Newton's law of gravitation affords the most notable example of the process of verification of a law of force, and incidentally of the Galileo-Newton theory. As a law of acceleration of the planets relatively to the sun, its approximate agreement with
Kepler's third law of planetary motion follows readily from a consideration of the character of the acceleration of a point moving uniformly in a circle. Newton's letters in this agreement led him to adopt the law of the inverse square of the distance about 1665-1666, before Huygens's results as to circular motion had been published. At the same time he thought of the possibility of terrestrial gravity extending to the moon, and made a calculation with regard to it. Some years later he succeeded in showing that Kepler's elliptic orbit for planetary motion agreed with the assumed law of attraction; he also correlated this in connexion with the law of universal electricity or diurnal tides. Finally, he made substantial progress with newton's exact calculation of the accelerations of the planets, especially for the case of the moon. The work of translating the law of gravitation into the form of astronomical tables, and the comparison of these with observations, has been in progress ever since. The discovery of Neptune (1846), due to the influence of this planet on the motion of Uranus, may be mentioned as its most dramatic achievement. The verification is sufficiently exact to establish the law of gravitation, as providing a statement of the motions of the bodies composing the solar system which is correct to a high degree of accuracy. In the meantime some confirmation of the law of diurnal tides and of the acceleration of the planets, and the attention of physicists is directed to the intervention of the ether. The study of such cases suggests that the statement in terms of force the relations between the motions of bodies may be only a provisional one, which, though it may summarize the effect of the actual connections between them sufficiently for some practical purposes, is not to be regarded as representing them completely. There are indications of this having been Newton's own view.

The Newtonian base deserves some further consideration. It is definite in the sense that relative to it all accelerations of particles correspond to forces. This test involves only changes of velocity, and so does not distinguish between two bases, each of which moves relatively to the other with uniform velocity without rotation. The establishment of a true Newtonian base presupposes knowledge of the motions of all bodies. But practically we are always dealing with limited systems, so any actual determination must always be regarded as to some extent provisional. In the treatment of the relative motions of a limited system, we may use a confusedly provisional base, though it may be necessary to introduce corrections, either exact or approximate, to take account either of the existence of bodies outside the system, or of the rotation of the base employed relative to a more correct one. Such corrections may be made by the device of applying additional unpaired, or what we may call external, forces to particles of the system. These are needed only so far as they introduce differences of accelerations of the several particles. The earth, which is commonly employed as a base for terrestrial motions, is not a very close approximation to being a Newtonian base. Differences of acceleration due to the attractions of the sun and moon are not unimportant, but are practically negligible at distances usually be ignored, but their effect (in combination with the rotation of the earth) is very apparent in the case of the ocean tides. A more considerable effect is due to the earth having a diurnal rotation relative to a Newtonian base, and this is never wholly ignored. Take a base attached to the centre of the earth, but without this diurnal rotation. A small body hanging by a string, at rest relatively to the earth, moves relatively to the base uniformly in a circle; that is to say, with constant acceleration directed towards the earth's axis. What is done is to divide the resultant force due to gravitation by two components, one of which corresponds to this acceleration, while the other one is what is called the "weight" of the body. Weight is in fact not purely a combination of forces, in the sense in which that term is defined in connexion with the laws of motion, but corresponds to the Galileo acceleration with which the body would begin to move relatively to the earth if the string were cut. Another way of stating the same thing is to say that we introduce, as a correction for the earth's rotation, a force called "centrifugal force," which combined with gravitation gives the weight of the body. It is not merely a term of force corresponding to an imaginary relation between two portions of matter. The effect of the centrifugal force at the equator is to make the weight of a body there about \(35\%\) less than the value it would have if due to gravitation alone. This represents about two-thirds of the total variation of Galileo's acceleration between the equator and the poles, the balance being due to the ellipticity of the figure of the earth. In the case of a body moving relatively to the earth, the introduction of centrifugal force only partially corrects the effect of the earth's rotation. Newton called attention to the fact that a falling body moves in a curve, diverging slightly from the perfectly vertical. The departure is expressed by the acceleration of a satellite to the earth.

Measuring time accordingly demands attention. A definition of the measurement dependent on dynamical theory has been a characteristic of the subject as presented by some writers, but it is neither necessary nor the case with the presentation in accordance with the historical development of science. Galileo measured time for the purpose of his experiments by the flow of water through a small hole under approximately constant conditions, which was of course a very old method. He had, however, some years before, when he was a medical student, noticed the apparent regularity of successive swings of a pendulum, and devised an instrument for measuring, by means of a pendulum, such short periods of time as sufficed for testing the pulse of a patient. The use of the pendulum clock in its present form appears to date from the construction of such a clock by Huygens in 1657. Newton dealt with the question at the beginning of the "Principia," distinguishing what he called "absolute time" from such measures of time as would be afforded by any particular examples of motion; but he did not give any clear definition. The selection of a standard may be regarded as a matter of arbitrary choice; that is to say, it would be possible to use any continuous time-measurer, and to adapt all scientific results to it. It is of the utmost importance, however, to make, if possible, such a choice of a standard as shall render it unnecessary to date all results which have any relation to time. Such a choice has been practically made. It can be put into the form of a definition by saying that two periods of time are equal in which two physical operations, of whatever character, take place, which are identical in all respects except as regards lapse of time. The validity of this definition depends on the assumption that operations of different kinds all agree in giving the same measure of time, such allowances as experience dictates being made for changing conditions. This assumption has successfully stood all
tests to which it has been subjected. All clocks are constructed on the basis of this method of measurement; that is to say, on the plan of counting the repetitions of some operation, adopted solely on the ground of its being capable of continual repetition with a certain degree of accuracy, and possibly also of automatic compensation for changing conditions. Practically clocks are regulated by reference to the diurnal rotation of the earth relatively to the stars, which affords a measurement on the repetition principle agreeing with other methods, but more accurate than that given by any existing clock. We have, however, good reasons for regarding it as not absolutely perfect, and there are some astronomical data the tendency of which is to confirm this view.

The most important extension of the principles of the subject since Newton's time is to be found in the development of the theory of energy, the chief value of which lies in the fact that it has supplied a measurable link connecting the motions of systems, the structure of which can be directly observed, with physical and chemical phenomena having to do with motions which cannot be similarly traced in detail. The importance of a study of the changes of the \( \frac{d^2}{dx^2} \) depending on squares of velocities, or what is now called the "kinetic energy" of a system, was recognized in Newton's time, especially by Leibnitz; and it was perceived (at any rate for special cases) that an increase in this quantity in the course of any motion of the system was otherwise expressible by what we now call the "work" done by the forces. The mathematical treatment of the subject from this point of view by Lagrange (1736-1813) and others has afforded the most important forms of statement of the theory of the motion of a system that are available for practical use. But it is to the physiologists of the 19th century, and especially to Joule, whose experimental results were published in 1843-1849, that we practically owe the most notable advance that has been made in the development of the subject—namely, the establishment of the principle of the conservation of energy (see Energies and Energy). The energy of a system is the measure of its capacity for doing work, on the assumption of suitable connexions with other systems. When the motion of a body is checked by a spring, its kinetic energy being destroyed, the spring, if perfectly elastic, is capable of restoring the motion; but if it is checked by friction no such restoration can be immediately effected. It has, however, been shown that, just as the compressed spring has a capacity for doing work by virtue of its configuration, so in the case of the friction there is a physical effect produced—namely, the raising of the temperature of the bodies in contact, which is the mark of a capacity for doing the same amount of work. Electrical and chemical effects afford similar examples. Here we get the link with physics and chemistry alluded to above, which is obtained by the recognition of new forms of energy, interchangeable with what may be called mechanical energy, or that associated with sensible motions and changes of configuration.

Such general statements of the theory of motion as that of Lagrange, while releasing us from the rather narrow and strained view of the subject presented by detailed analysis of motion in terms of force, have also suggested a search for other forms which a statement of elementary principles might equally take as the foundation of a logical scheme. In this connexion the interesting scheme formulated by Hertz (1894) deserves notice. It is important as an addition to the logic of the subject rather than on account of any practical advantages which it affords for practical calculation.

[Note: The rest of the text is not visible in the provided image.]
told the story of a stirring period in the history of the world with full attention to the character of the actors and strict fidelity to the vivid details of the action. But it may safely be said that his tale is best where most unvarnished, and probably no writer of the same rank has owed less to the mere sparkle of highly polished but bare-writing.

An excellent edition of his historical works was published in nine volumes in London in 1903-1904. See the Correspondence of John Lathrop Motley, edited by G. W. Curtis (New York, 1889); O. W. Holmes, John Lathrop Motley, a Memoir (Boston, 1874); M. D. Conway, Biographical Introduction to The Rise of the Dutch Republic (London, 1866); and John Lathrop Motley and his Family: Further Letters and Records (1910), edited by his daughter, Mrs Susan St John Mildmay.

MOTLEY, i.e. of many colours, a term particularly used of the parti-coloured dress of the professional "fool" (q.v.) of the middle and later ages. The origin of the word is probably to be found in "mote" (O. Eng. mot), a particle of dust, &c., hence a spot or patch. "Mottle," a blotch or spot, probably is a back formation of motley.

MOTMOT. According to Hernandez in his Historia avium Novae Hispaniae (p. 52), published at Rome in 1651, this is the Mexican name of a bird which he described well enough to leave no doubt as to what he meant; but the word being soon after printed Motmot by Nieremberg and others gave rise to the Latinized Motomotus, invented by M. J. Brissius as a generic term, which has since been generally adopted by ornithologists, though motmot has been retained by some. Linsley has noticed of only one species of motmot, and referred it to his genus Ramphastos (properly Rhamphastos) under the name of R. motota. This is the Motomotus brasiliensis of modern ornithologists, and from its geographical range cannot be the original Motomot of Hernandez, but is most likely the "Guira guaiambu" of Margrave.

The motmots form the sub-family Momotinae, which with the Todinae (see Tov) form the family Momotidae of Coraciform birds, the nearest allies being rollers (q.v.) and kingfishers (q.v.). In outward appearance the motmots have an unobtrusive resemblance to bee-eaters, but, though beautiful birds, various shades of blue and green predominating in their plumage, they do not exhibit such decided and brilliant colours; and, while the bee-eaters are only found in the Old World, the motmots are a purely Neotropical form, extending from southern Mexico to Paraguay, and the majority of species inhabit Central America. Their ordinary food is small reptiles and fruits, and insects caught on the wing. The nest of one species, as observed by Robert Owen, is at the end of a hole bored in the bank of a water-course, and the eggs are usually four to a clutch and glossy (Ibis, 1861, p. 65). Little else has been recorded of their ways.

The Momotidae form but a small group, containing about six genera, of which the best known are: Momotus, Baryphengus, Hylomances, Eumomota, Asphota and Priamykynchus, and the number of species is very small. While all have a general resemblance in the serrated edges of the bill and many other characters, Momotus has the normal number of twelve rectrices, while the rest have only ten, which in Hylomances have the ordinary configuration, but in adult examples of all genera the number of the median pair is devoid of bars for the space of about one-fifth of the length, a characteristic of extreme scarcity, so as to produce a spatulate appearance, such as is afforded by certain humming-birds known as "racquet-tails" (see Humming-Bird), kingfishers of the genus Tanytela (see Kingfisher), and parrots of the group Priamus. C. Waterton (Wanderings, Journey 2, chap. iii.), mentioning the species M. brasiliensis by its native name "boutou," long ago asserted that this peculiarity was produced by the motmot itself nibbling off the bars, and this extraordinary statement, though for a while doubted, has since been shown by O. Salvin (Proc. Zool. Society, 1873, pp. 429-433), on A. Bartlett's authority, to be perfectly true. (A. N.)

MOTORS, ELECTRIC. Fundamentally, electric motors are electric generators reversed in function: they convert into mechanical energy the continued stresses between two electro-magnetic fields relatively movable, just as generators convert into electromagnetic stresses the mechanical energy applied to them. Since no transformation of energy is ever absolutely quantitive, the conversions just considered are not accomplished without loss of energy to about the same extent in both cases. The sources of this loss are ohmic loss in the conductors, hysteresis, friction of bearings and brushes, air friction and eddy currents; the sum of these losses in large modern machines does not exceed $5$ or $6\%$. The torque of the motor is the dynamical result of the electromagnetic stresses between the magnetic field of the motor and that due to the armature currents, the latter field being proportional to the strength of the current sheet due to the numerical strength of the current and the number of its effective convolutions. This applies to all types of motors, if one remembers that whenever either of these two stress factors is a periodic variable, as in the case of alternating currents, the torque is proportional to their geometrical co-directed product and not merely to their numerical product. At this point it will be convenient to distinguish between the various types of motors. The first broad distinction is between continuous-current and alternating-current motors, a distinction rather of convenience than of necessity, for in point of fact the two depend upon the same broad principles and can be considered on precisely the same lines.

Electric motors may be conveniently divided as follows:—

(A) Continuous Current.

1. Separately excited.
2. Series-wound constant current.
5. Shunt-wound constant potential.

(B) Alternating Current.

1. Synchronous constant potential.
2. Induction-polyphase constant potential.
3. Induction-monophase constant potential.
4. Repulsion-commutating.
5. Series-commutating.

Of these, the series-wound constant potential, shunt-wound constant potential, and polyphase induction motors do a very large proportion of the active work of power transmission: the first mentioned furnish power for electric railways; the second chiefly power distribution from public electric supply stations; while the third are mainly relied upon in long-distance transmission systems. The fourth and fifth groups of class (B) are old in principle but have been slow in practical development. They embody many modifications and transition forms not involving radical changes in the principles or properties of the machines. Their chief use has been for electrical traction, with reference to which they have, in the main, been developed, and their performance is best at low frequency, 15 to 25 cycles per second.

In class (A) in general, for a certain value of the torque current must be forced through the armature against the motor electromotive force which results from the rotation of the armature in a given field. This demands a certain greater applied electromotive force to produce the current required, which is determined by the effective electromotive force, equal to the geometrical difference between the applied and motor electromotive forces, and by the impedance of the armature. For steady currents this last is of course the same as the ohmic resistance, just as for steady electromotive force the geometrical and the numerical difference of the applied and motor electromotive forces are coincident. The torque depends, as heretofore noted, on the field strength and the strength of the current sheet due to the current thus determined. For small values of the torque the speed practically depends upon the applied electromotive force and the field, so that if the former and the latter be constant the speed is also sensibly constant. This is likewise the case if the armature resistance be very small; and in general the variations of speed at constant potential are determined by the product of this resistance and the torque, while the absolute speed depends essentially upon the field strength. Motors for low speed or high
electromotive force must have both a strong field and many turns upon the armature, so that both the fundamental stresses may be large. As the field is generally strong—to secure economy of iron—low-voltage and high-voltage machines differ principally in the number of armature turns. For variable speed, this latter factor being fixed, field strength and applied electromotive force are the factors easily altered, and most of the speed variation is accomplished by changing one or both of them. Torque, neglecting field distortion, is at a maximum when the current is the greatest possible at the given applied voltage—that is, when the motor is at rest. With a small armature resistance this current is generally far too great for convenience; hence the motors are usually started with a rheostat in series with the winding if the current is not limited by the generator itself. The torque then depends on the sum of the resistances in circuit, and can be made just sufficient to start the motor under the required load. By the same device the motor can run at reduced speed, although with a considerable loss of energy in the rheostat; it is indeed, as a rule, difficult to get effective speed variation in motors of any kind without serious loss of energy. The field can be changed within wide limits only by a considerable increase of the iron in the magnetic circuit, the applied electromotive force cannot usually be varied except by increasing the resistances in circuit, and the number of armature turns cannot be varied without complication, although the effective number can be modified by shifting the brushes, probably at the expense of sparking. Altogether, if the speed variation demanded be more than 15 or 20%, it causes, in one way or another, considerable expense and trouble, particularly if each speed must be closely held irrespective of change in load, by centrifugal. Similarly, a motor may give a very nearly constant speed at constant potential by a different winding in series with the armature, weakening the field as the armature current rises. This device, however, obviously increases the energy required for magnetization, and decreases the effective torque at starting. Practically, the best continuous-current motors can be made to hold their speed to within 1 or 2% from no load to full load. Commercial machines, however, generally vary from 5 to 10% in speed. With respect to the direction or rotation of a motor, the torque changes sign with a change of sign in either field or armature current, but not with a change of sign both. The impact of the motor may therefore be practically equal to the product of the current and the applied electromotive force, while the output is determined by the product of the current and motor electromotive force; hence the efficiency of the motor as a transformer of energy is the ratio between these two quantities. The output is a maximum when the applied electromotive force is double the motor electromotive force, and the efficiency is a maximum when the motor and applied electromotive forces are substantially equal. At the point of maximum output the speed is that sufficient to reduce the current to one-half its static value. No motor is worked at or near this point, except exceptionally, on account of the low efficiency and severe heating in the armature. These theoretical values are slightly modified in practical machines by the small miscellaneous losses subject to independent variations.

The practical output of electric motors is limited in machines of normal design by the temperature they can safely endure. As a rule the working temperature, which is commonly reached only after six hours or more of continuous running, should not rise more than 40° to 50° F. above the temperature of the surrounding air. In case of traction motors and others subjected to occasional severe overloads, separated by periods of rest or of subnormal load, the temporary rise of temperature tolerated may be much higher, say 60° to 75° F., after a run of an hour or so. The temperature of the air is assumed at 70° F. in most cases, and the temperature of the motor-windings is preferably ascertained by the rise in electrical resistance due to the heating. Thermometers can seldom be so applied as to measure the full heating effect.

The actual output obtainable from a motor structure of given dimensions under these conditions with respect to heating depends chiefly on the practicable rotative speed of the armature, since the chief losses are proportional to the torque, while the mechanical output at given torque is approximately proportional to the speed. Most makers utilize a single structure for several standard motors varying in speed and output, a 1.5 h.p. machine at, say, 1200 r.p.m. becoming a 10 h.p. at 800 r.p.m. or a 20 h.p. at 1600 r.p.m. There is no practically fixed relation between the rating and the speed, although it is approximately linear, for in winding the same carcass for different speeds the ratings are settled rather by commercial convenience than by exact determinations. Motors generally have approximately the same efficiencies as the corresponding sizes of generators. Small motors, say from 1 to 5 h.p., are commonly of 70–80% efficiency at full load, medium sized machines of 5 to 50 h.p. about 80 to 90%, and the larger sizes run up to 95% or thereabouts. In the effort to get low-speed motors without materially increasing the cost they are generally dropped a little in efficiency and allowed to run hotter than if wound for higher speeds.

The weight of motors per h.p. of output is therefore very variable. In machines of medium size and speed it is likely to be 70 to 75 lb per h.p., falling to 30 or 40 in large or specially high speed machines, and rising to 80 or 100 lb in small or very low speed motors. High-voltage motors, particularly if small, lose somewhat in relative output on account of the space taken up by the necessary insulation.

In all ordinary motors the magnetization of the iron is, for economy of material, pushed high; and hence the field, even at heavy loads, is fairly stable and the conditions of commutation remain good. When, however, motors are designed to stand severe overloads, or to admit of a wide range of speed regulation by varying the field strength, the commutation is likely to be unstable, and severe sparking may result. To meet this condition the commutating-pole motor—really a recrudescence of an old idea—has been introduced on a considerable scale. In this construction auxiliary pole pieces, excited by series coils from the motor circuit, are set midway between the ordinary field poles. The office of these poles is to neutralize the magnetomotive force due to the armature winding, thus checking field distortion, and also to ensure the proper reversal of the current in the armature windings excited by the direct magnetomotive force due to the windings of the commutating pole, the major part, perhaps three-fourths, is devoted to the former work and the remainder to the latter, the proportion varying widely according to the design of the motor. The result of this construction is excellent, sparkless commutation being ensured over a wide range of load and field strength. The commutating-pole motor is intrinsically more expensive and slightly less efficient than the ordinary type, but for the particular kind of service it is designed to perform is extremely effective. It gives promise of especial value in high-voltage traction motors.

(A) 1. Separately excited Motors are interesting principally on account of the very efficient method of speed regulation possible by their use. In this method the field of the motor is excited from the supply mains, and the armature circuit furnished by a motor-generating unit running at constant speed. A rheostat in the shunt field of the latter element enables the applied electromotive force to be varied, according to the demand for speed. In this way any given full torque at any speed up to that assigned by the maximum value of the electromotive force which can be applied to the armature. Moreover, if the armature resistance be small, the motor is fairly well commutated at all speeds. The effect is rather startling, since the motor may be giving a very great torque when it is merely turning over at a few revolutions per minute; and although the process is complicated, it leads to excellent results, and is widely used where delicate speed regulation is required.
MOTORS, ELECTRIC

A 2. Series-wound Constant-current Motors were early worked to a considerable extent on arc-lights circuits, but have now passed out of use save in a small number of constant-current power transmission systems. The armature reaction and the consequent simplification of magnetic design, which make the electromagnetic force is directly proportional to the output, the torque constant. They will not start with more than a certain definite load, but once started the speed will increase until and does not change with the load. In the case of the load, the resistance alone, but upon the impedance and upon the geometrical difference between the applied and motor electromagnetic forces. The current in the armature is constant, and the load by the armature conductors by shifting the brushes. Both methods are carried out mechanically rather than by purely electrical means—in the former the brush is placed in the armature circuit, and in the latter by the mechanical brush shifter, but neither is wholly satisfactory. Nevertheless, such motors have proved capable of excellent commercial service in some of the European plants, especially in the larger sizes.

The field connections of series-wound motors are the same as those of series-wound generators, and nearly all motors used for electric traction—aggregating not less, probably, than one and a half million horse-power; hence they are of great practical importance.

Armature conductors are usually highly specialized machines with very powerful armatures and fields strongly saturated at all working values of the current. The brushes have an invariable position. Such motors behave much like separately-constant-current motors, and for the same reason; that is, they are nearly always governed by the instantaneous effect of the motor—that is, the ratio between the numerical and geometrical products of current and electromagnetic force—may be given various values at will by changing the field excitation of the motor, a most unique and valuable property. If the motor electromagnetic force be fixed and the output varied, the phase angle between current and motor electromagnetic force varies by reason of the armature reaction. The force produced by the field excitation, at which the point of load and the applied load point incide coincides. The input can then be accurately measured by voltmeter and ammeter readings, and the motor is working at its best efficiency. This is possible with electromagnetic force the current leads in phase with respect to the applied electromagnetic force; for less values it lags. In the former condition is accompanied by the rising of the electromagnetic force up to its limit by the term, or by the time it takes for the effect of the armature reaction to be visible. The motor cannot be used in the application of the power directly to the supplied circuit. A synchronous motor, if the necessary current due to the load be not too great, as a voltage and phase regulator upon a synchronizing motor, a circuit, a very valuable in power-transmission systems. If the excitation is set to produce leading phase at small loads, the phase angle will gradually diminish as the load rises, and then, passing through zero, again with the lagging angle characteristic of the motor at small loads. In a well-designed synchronous motor, by proper initial adjustment of the field, the power-factor can easily be kept between 0.95 and 1 from quarter load to full load, and very close to unity various the ordinary working range. Since the necessity to start independently, the synchronous motor is a highly desirable addition to a transmission system. Starting is generally accomplished by the help of an induction motor or other auxiliary power, and the motor is started merely as a motor; it is then thrown over the supply circuit. A synchronous motor will pull itself up to synchronism if brought near to its synchronous speed, but this takes a considerable time. Synchronous motors, if the current of its own, can be brought to speed by giving it a small initial rotation and raising the generator speed very carefully and gradually, when the two machines will accelerate in synchronism. Polyphase synchronous motors, of these synchronous motors, may, however, be started as quasi-induction motors with an open field circuit, the pole faces serving as secondary conductors, but require so large currents in such starting themselves that it is better practice to bring them to speed dependent on the alternating current voltage of the supply, the converter cannot advantageously be used to control the armature reactions, and it may or may not, according to the conditions of load, be in phase with the impressed electromagnetic force. In the case of the continuous-current motor, the motor is, therefore, a double-purpose motor, and the power consumption, the alternating current, these quantities are usually not in phase, in alternating motors the ac-dc system is determined by the condition of this system, and the combined armature reaction and armature currents affects the phase of the output of the motor; the speed of the motor being variable, its motor electromagnetic force depends only on the effective excitation, including the armature currents, and of their fundamental variables in the armature, and the torque depends only on the armature current.
the power factor by variation of the field strength, but the field can be adjusted once for all to hold the power factor reasonably near unity, provided independent means are available for so adjusting the field strength as to give the secondaries the correct armature reaction and commutator. If close regulation of the direct-current voltage is not demanded the converter field can be used more freely. As a matter of fact the synchronous converter finds its chief use in electric lighting, where close regulation is not so important, and motor-generators in one form or another have been found more suitable for electric-lighting work. The synchronous converters have an important “brushing” or “smoothing” effect as the field has already been made, sometimes even of sufficient amplitude to throw the machine out of step, and are often provided with the shoes or brushes found useful with ordinary synchronous motors.

Synchronous commutators, "permutators," and the like, usually have motor-parts of very moderate capacity, and must be kept rigorously free of hunting in order to perform well.

In many instances, particularly in American practice, motor-generators with induction motors have been used for ease of starting and to secure immunity from hunting. A modification of interest in the motor standpoint is found in the "cascade converter." In this machine the rotor of an induction motor is directly coupled to the armature of a commuting converter of equal output, the windings of the two being in series and approximately equivalent. In this case the normal motor-electromotive force is reached at approximately half synchronous speed, and half the energy is delivered to the load, the other half appearing at the output of the frequency changer, the rest by torque on the shaft. Commutation takes place therefore at half the initial frequency, which is often a great advantage.

3. Polyphase Induction Motors.—Speaking broadly, an induction motor is one in which the armature current is introduced into the armature windings by electromagnetic induction instead of by brushes. It is at once an alternating-current transformer and an electric motor. The process of induction consists of two concentric masses of laminated iron taking the form of short hollow cylinders, of which the outer is fixed and the inner fitted to revolve. The outer surface of the inner drum and the inner surface of the outer drum is the armature of the primary and secondary windings of the apparatus. The outer winding is usually the primary, and the inner (or armature) winding the secondary. The primary winding is in most instances a multi-polar drum in character; the secondary is, in the most highly developed motors, of the same character, but very often consists merely of numerous insulated armature bars united at each end of the drum by a common end-plate or end-ring, forming the structure usually known as a "squirrel-cage" winding. In polyphase motors of the usual type the primary drum winding is in duplicate or triplicate, resembling very closely the armature winding in a two- or three-phase motor, but the number of poles has been the subject of much debate; most of the theoretical discussions of the matter have been based upon the concept of a rotary magnetization, but it is equally possible to employ simple problems in quadrature upon the same core, or, in the case of a three-phase motor, three superimposed in a similar symmetrical manner. This hypothesis is often most convenient, being merely an application of the vector theory and including magnetic characteristics that are fundamental in the second order. The motions in quadrature produce circular motion, as in the case of the conical pendulum. All the results of this hypothesis follow, however, from the introduction of alternating magnetizations, acting in quadrature in time but independently; and one or the other view of the matter is convenient according as, in the structure considered, the effective magnetizations do or do not produce a definite physical result.

The essential point of difference is that the stable angular displacement between the field magnetization and the armature currents which co-act with it is obtained in the polyphase machines by the displacement of the magnetic field, while in the single-phase motor it is obtained by the angular space-displacement of the armature, which has to be set up by an initial rotation. Single-phase motors therefore are not inherently self-starting and run in either direction equally well when once started. The torque is always in the direction of the initial rotation. This rotation is sometimes given by hand and sometimes by auxiliary phase-windings supplied by derived current from the main motor. The auxiliary windings, first receiving induced currents from the main winding, then act to produce an initial disturbance which will cause the motor to start, and the direction of the torque, and have as yet not come into very extensive commercial use, although under special conditions they have been and are successfully employed. A theoretically interesting form of induction

MOTORS, ELECTRIC     913
motor is a modification which runs at absolutely synchronous speed, utilizing energy in the secondary not in virtue of slip behind synchronous speed, but from great difference in wave form between the primary and secondary circuits, so that energy due to harmonics is the current in the circuit; the magnetic axis is represented by laminae in spite of synchronism in speed. Such motors are not employed commercially, but sometimes find a field for usefulness in the laboratory.

Alternating Current Motors. The motors which have been mentioned are all of the direct current class, and there are several types of alternating-current motors. These different types may be classified as follows: (1) polyphase, (2) single-phase, and (3) series-commutating. Of these types polyphase motors are suitable only for high-powered work, as they cannot be used where a large number of separate starting motors are in use. Single-phase motors are at present the most important for small power, and series-commutating motors are the most important for high powered work.

Polyphase Motors. These consist of a number of single-phase motors, each having its own commutator, and all connected in parallel. They are more expensive than single-phase motors, and are used only in large power work.

Single-Phase Motors. These are the most important type of alternating-current motor. They are used for small power work, and are also used in large power work on account of their simplicity.

Series-Commutating Motors. These are the most important type of alternating-current motor. They are used for small power work, and are also used in large power work on account of their simplicity.

B. Series Commutating Motors.—This important and interesting type is derived directly from the ordinary series motor for continuous current. The torque in these does not change sign with reversal of the current in both field and armature, and consequently the speed remains practically constant in all speeds. Practically the first step toward an alternating current series motor is the commutation of the field to reduce parasitic currents; the second is to keep down the reactance. A laminated field motor performs this duty to a large extent, and in addition it is useful at ordinary frequencies requires modification in design.

The motor E.M.F. being as before the geometrical sum of the primary E.M.F. of the motor and that due to motion of the armature conductors, the first improvement can be made by making the latter dominant, i.e. by making the armature relatively very powerful. The plain series commuting motor has then a relatively weak laminated armature, and in order to keep down the reactance of the device the magnetic axis of the armature is held at a fixed angle with the field flux, so that the condition for steady torque is always fulfilled, its amount depending on the position of the brushes. With these conditions the torque is zero in the first case from lack of angular displacement, in the second from lack of secondary current. The brushes, when skewed, however, the secondary current is maintained at a suitable value, and the motor runs in a definite direction. The general principle is merely that of a transformer with a movable secondary under magnetic thrust. During reversal of the current the torque is reversed, and the fixed angle is maintained by the currents both change sign, preserving the magnetic relations as in a series-wound continuous-current machine.

If such a motor is of moderate reactance, the currents are large and the design is simple. The repulsion-commutating connection is considerably used as a starting device for single-phase induction motors, the commutator being short-circuited as a whole when the armature is at rest. Such a machine operates as a pure induction motor of the sort just described. The advantage of this change is that the commutator is eliminated, save at starting, and the motor becomes practically a constant speed machine like any other properly-designed simple induction motor. Such motors can be made to start if necessary with several times the normal running torque and a nearly proportionate increase of current. The commutation is done automatically; it is being performed at 45 degrees to the brushes. Having no fixed speed and being capable of running far above nominal synchronism. This results from the fixed angular relation maintained by the brushes between the armature and field magnetizations, whereby the torque conditions are preserved. Above the nominal synchronous speed, however, difficulties of commutation set in, so that some modifications of this simple type are desirable for wide ranges of speed. The power factors of these motors compare well, both in starting and in running, with those of the best pure induction motors, and their efficiencies are similar. These machines are reversible, serving as alternating generators when driven mechanically.

Instead of simply skewing the brush line in the repulsion motor, an entirely analogous effect may be produced by dividing the field coils into pairs placed in quadrature, the brush line being parallel to the axis of the former. The result is that the quantity of energy required to divide the function of the original field physically into its components, a change which sometimes tends to improve the stability of the machine.

A more radical departure is found in the group of so-called "compensated-repulsion" motors, of which there are several members, due to various inventors, all material improvements on the pure repulsion type just described. Their common characteristic is that while possessing like simple commutator-repulsion motors, a transformer-like feature acting upon the armature as secondary, and a pair of skewing brushes holding the resulting armature magnetization in deflection, the field is designed to run in series through the armature via a second pair of brushes in quadrature with the former. The fundamental effect of this series connection is to cut down the virtual reactance of the armature as the speed rises, practically annihilating it at synchronous speed. In alternating motors the motor-electromotive force is not merely that due to the motion of the armature conductors but the geometrical resultant of the "E.M.F." of the armature and the "E.M.F." of the armature, and analogous machines an auxiliary E.M.F. is applied either as here, conductively or inductively, in such direction as to compensate mutually. The armature E.M.F. of this sort is so designed as to be as low as possible, that the "E.M.F." of the armature may be to a practical extent entirely due to the skewing of the flux. The "E.M.F." is introduced by an auxiliary winding in series and in quadrature with the main field, instead of by supplementary brushes. The modifications of the general scheme are rather numerous, and out of these there have come some excellent single-phase motors the field widely used for traction purposes.

Light Vehicles.—The first practical steam carriage was made by Richard Trevethick in 1802 (fig. 1), though Cugnot had produced a rudimentary one in France in 1769; but very little was done in
MOTOR VEHICLES

this direction until 1824, from which date a number of these vehicles were constructed and used with considerable success, taking the form of stage coaches propelled by steam, and weighing some 3 or 4 tons unloaded. Some of these ran regular passenger services, notably between Cheltenham and Gloucester, attaining average speeds of 10 to 14 m. per hour; but great opposition was met with owing to the narrow prejudice of those whose interests related to horse-haulage, and every obstruction was offered in the shape of prohibitive tolls and legislative enactments. The result was that steam carriages were driven off the roads in favour of railways, although the select committee of the House of Commons appointed in 1831 to inquire into the subject reported completely in favour of their adoption (as did also that of 1873). In 1861 the first Locomotives on Highways Act was passed, but the crushing blow came in 1865, when the legislature prescribed (1) that the number of persons required to drive the locomotive should be increased to three; (2) that a man should precede with a red flag; (3) that the maximum limit of speed should be reduced to 4 m. per hour; and (4) that they should be forbidden ever to blow off steam, &c. These restrictions were confirmed rather than relaxed by the 1878 act. Although these acts were created to deal with heavy traction, the famous 1881 appeal in the court of queen's bench placed every type of self-propelled vehicle, from a traction engine down to Bateman's steam tricycle, under their narrow limitations. This resulted in the development of the heavy traction engine, and light motor vehicles were little more heard of in Great Britain. There were a few exceptions, however, notably the steam vehicles of Rickett (1860), Carrett (1861), Tangye (1862), Yarrow (1862), Holt (1866), Todd (1870), Perkins (1870), Mackenzie (1873) and Blackburn (1878), and some electrical carriages made by Elwell (1884), Ward (1886) and Volk (1888). An important departure was that of Butler, who constructed in 1885 what is believed to be the first vehicle (a tricycle) propelled by an internal combustion engine in England (fig. 2); he used the vapour of benzoline exploded electrically. Later, Roots successfully employed heavy oil, as did Knight. The chief prohibitory clauses of the acts were repealed in 1896, when the development of the internal-combustion engine had opened up entirely new prospects and suggested new possibilities.

Gottlieb Daimler's invention in 1885 of the internal-combustion motor using petroleum spirit was the first step towards the production of the modern self-propelled road vehicle, the next step being the recognition in 1887 of the advantages of Daimler's system by M. Levassor and his application of that system to the propulsion of a carriage. In the nine years that immediately followed French manufacturers spent large sums of money in experimenting with and developing the motor-car, and by 1896, when the Enabling Act was passed, there were a few practical vehicles in England but, perhaps, fewer probable buyers. British makers, starting as they did in the wake of the French manufacturers, were able to profit by the experience gained by the latter, and thus to avoid many otherwise inevitable mistakes; they may not be able to claim to have originated many of the fundamental details of the modern motor-car, but their experience was gained at a comparatively small cost.

Gottlieb Daimler's engine marked a great advance in the production of a source of motive power, for its efficiency was large as compared with its total weight, whilst the simplicity of its fuel system brought it within the scope of the person of average mechanical instincts and intelligence, for, even in its early days, the internal-combustion motor did not demand that its user should possess an intimate knowledge of engineering. Daimler fitted one of his motors to a bicycle in 1885, and afterwards applied the system to the propulsion of boats, one or more of which were running on the river Seine in connexion with the Paris Exhibition of 1887. It was this fact that brought the invention to the notice of M. Levassor, of the firm of Panhard & Levassor, makers of wood-working machinery, who saw the possibilities of its application to the propulsion of a road carriage. MM. Panhard & Levassor secured the French patents from Daimler, and M. Levassor devised the transmission system which, as far as its general scheme is concerned, is unaltered to-day, despite many efforts on the part of skilful inventors and designers to secure something better. M. Levassor placed the engine in front, the axis of the crank-shaft being parallel with the side members of the frame of the vehicle. The drive was taken through a clutch to a set of reduction gears and thence to a differential gear on a countershaft from which the road wheels were driven by chains. With all the modifications of details, the combination of clutch, gear-box and transmission remains
unaltered, so that to France, in the person of M. Levassor, must be given the honour of having led in the development of the motor-car.

Progress in the improvement of design was slow until the year 1894, when a great impetus was given to the French industry by the organization, by the Petit Journal, of a trial run of motor vehicles from Paris to Rouen. The measure of success attained by the cars caused considerable surprise, and in the year 1895 a race was organized from Paris to Bordeaux and back, a distance of 744 m., when the winning vehicle covered the journey at a mean speed of 15 m. per hour. From that date onward, until 1908, racing played an important part in the development of the motor-car; in fact, it is not going too far to say that, up to 1904, it played a vitally important part therein. The effect was a rapid development in speed, efficiency and reliability, and others besides the sportsman and the individual seeking for new sensations were attracted towards the new vehicle. Racing was not indulged in in England or Scotland, the authorities having no power to close the roads for the purpose.

In July 1902, Mr S. F. Edge, driving a 50 h.p. Napier car, won the Gordon-Bennett Cup in the course of the open race from Paris to Vienna. This trophy has played an important part in the history of the motor-car. It was offered for competition among cars, entered by recognized National Automobile Clubs, no more than three cars being permitted to represent a country, and every car had to be built entirely in the country of its origin. The length of the race had to be not less than 500 kilometres (311¼ m.). The first two races in 1900 and 1901 had been won by French cars and, as these contests had been run concurrently with the big city-to-city races, the importance of the Gordon-Bennett race was overshadowed. But it stood out in bold relief when an English car wrested the international trophy from its French rivals in 1902. The Automobile Club of Great Britain and Ireland (now the Royal Automobile Club) at once secured parliamentary sanction for the use of certain roads in Ireland for a limited period, and proceeded to organize a race worthy of the issue at stake. The race was won by the Mercédès car, the latest production of the famous house of Daimler.

The Mercédès car set quite a new fashion, for it showed advancement in a large number of its mechanical details, and many of these details were either copied or used as the basis for radical changes in previously-existing designs. So far as British makers were concerned, the Mercédès fashion was allowed to predominate, but some of the older French makers were less willing to follow the lead of the great German house. This fact assisted the British makers to forge ahead in their competition with the French. But the great factor in the triumph of British motor engineering arose from the fact that, in England, there was a great wealth of knowledge concerning the properties of steels and steel alloys, and that knowledge, which was advancing all the time, was turned to such good use that it is safe to say that, in only the very best of French cars is the same strength and efficiency obtained from the same weight of metal as would be used in the construction of quite a number of British cars. Lightness of moving parts has led to increased engine efficiency and to economy of fuel, whilst the inert parts of the mechanism—the frame and other fixed details—by being lighter, call for a smaller expenditure of power to overcome their inertia. Apart from the employment of special steels for motor-car construction, in which England took a leading part, many improvements
becoming the private carriage of the wealthier classes to be used on all occasions.

If the motor-car in the guise of a private carriage has developed at an astonishing rate, its adaptation to the needs of the community, as a public service vehicle, has been even more rapid. The first cars placed on the streets of London in 1903 were by no means a success, but the cars constructed by the French house of Renault and first introduced in London in 1906 rapidly effected a revolutionary change in the means of individual transport. Apart from the improved speed of the motor-cars, they gained popularity because of the use, on each one of them, of the taximeter, showing at a glance the amount of the fare charged or overcharge on the part of the driver. One effect of the employ-
ment of motor-cars and motor-omnibuses has been to reduce slightly the total number of vehicles, and to quicken a large volume of the traffic; it is now being recognized that to increase the speed of the whole of the traffic of London by about 5 m. an hour is practically equivalent to doubling the width of the whole of the main streets.

The new British act of 1903, which was enacted for three years only, was, during the parliamentary session of 1906 and subsequent sessions, continued from year to year because of the difficulty that was experienced in reconciling conflicting views about the control of motor-cars. The 1903 act raised the speed limit to 20 m. per hour and gave the local government board power to close to motor traffic such roads as, on inquiry, might be deemed unsuited thereto, and to impose a speed limit of 10 m. an hour or less in dangerous places, such as narrow streets in a town or through a village. A few serious accidents in England, and many abroad, have kept alive the fear that the motor-car is a dangerous vehicle that should be restrained or held in check by stringent legislation. Thus from 1904 onwards, the motorist was under continuous police supervision. Police traps, or measured distances, over which the motor-car is timed by the police, were established in most of the counties of England, and, whilst, without a doubt, many real offenders were caught, it is equally true that many innocent drivers were unfairly accused, whilst motorists guilty merely of technical infringements of the law were exonerated.

The attitude of the police in showing little or no leniency in the application of the law probably, however, did good in other directions, although these were not contemplated either by the law-givers or the police themselves. It considerably limited the use of excessively powerful cars (for example, a 60 or 90 h.p. car that could easily attain 60 m. an hour), and experience has demonstrated the fact that, intersected as England is with a network of narrow roads carrying considerable traffic, there is little opportunity for the full power of such a car to be used. The result has been that the comparatively low-powered vehicle has been developed in efficiency, bringing with it the advantages of economy in running, simplicity of mechanical details, cheapness of maintenance and ease of control and management.

The principle of the internal-combustion engine has not been altered since Daimler's day, but the mechanical details of the engine have undergone constant revision and improvement, until in 1910 it was safe to say that a four-cylinder engine, with a cylinder bore of 4 in., constructed, we will presume, in 1899, might have developed 20 h.p. or less, whereas engines of the same cylinder bore made in 1908 and 1909 actually developed 60 h.p. and more, and the attainment of even greater efficiency was in sight in 1910. Experience showed that the saving of weight meant greater economy in fuel and also in tires, the two principal items in the upkeep of the motor-car. Engine design has undergone unceasing improve-
ment, and constructional methods have been continuously advanced, with the end in view of attaining lightness, not only in the moving parts, but in the inert parts. Lightness in reciprocating parts, such as the pistons, connecting rods and valves, has enormously improved crank-shaft speed. Cylinder castings are now made far lighter, whilst the water jacketing, for dissipating the excess of heat from the cylinder walls, is now of sufficiently ample proportions and, in consequence, better lubrication of the cylinder walls can be maintained. This again conduces to piston speed. The improvements of the first type of the earlier types were opened under atmospheric pressure, the reduced pressure in the cylinder, caused by the downward movement of the piston, enabling the pressure of the outer atmosphere to open the valve against its light spring, and to carry in a charge of the carburetted air that constituted the explosive mixture. But it was found that the automatic or atmospheric inlet valve opened late on the induction stroke and closed early, so that the engine only received an attenuated charge. One of the greatest improvements in engine design, therefore, was the employment of the mechanically-operated inlet valve operated by a cam exactly as the exhaust valve is operated. This valve could be fully opened as soon as the piston had begun its downward or induction stroke, and could be held open during the momentary period when the piston was at rest at the bottom of the stroke, thus ensuring a full charge of explosive mixture.

The method of exploding the charge in the cylinder has undergone revolutionary changes. The first method, that of heating the exterior of a closed tube connected with the cylinder, quickly gave way to electric ignition because it was found that the charges could not be exploded by the hot tube until the piston had reached the top of its stroke, and, at the comparatively high piston speed of these engines, the piston had moved some distance on its downward stroke before the exploded gas had begun to expand. Electric ignition was an improvement because it enabled a "lead" to be given to the explosion, a low voltage current (from four to six volts of about one ampere being sufficient for the purpose) being automatically switched on to the primary circuit of a coil, the induced current in the secondary circuit being of a voltage sufficiently high (calculated at from 2000 to 10,000 volts of a very small amperage) to jump across a gap left in a sparking plug inserted in the cylinder. By rotating the body of the switch (called the contact breaker) the ignition could be timed to suit exactly the speed of the pistons and, in this way, greater piston speed was obtainable. The great development of this system was the introduction by Mr F. R. Simms, in conjunction with Herr Bosch, of the magneto machine, known as the Simms-Bosch magneto, the prototype for many such appliances. This machine, in its simplest elements, produces a low voltage current (assumed to be of about eight or ten volts) by the rotation of an armature in the magnetic field of a set of magnets, the rotation being effected through the timing-gear wheels of the engine. The low tension current is conveyed through a primary circuit inducing the secondary current which is employed for igniting the charges. The advantages of the magneto are, firstly, that the primary current is created by the engine, and that the need for an accumulator as a source of that current is avoided. Secondly, that the spark is more efficient because the faster the armature is revolved the more intense is the primary current and the induced current, consequently, the charge is ignited more rapidly. The magneto machine has almost entirely displaced the accumulator system for ordinary running, although, as the latter makes for easier starting, it is often fitted as an addition.

Great gain in power has been secured from improvements in the lubrication of the internal-combustion engine. It is now recognized that a small supply of oil to the journals and bearings of such an engine is insufficient, but in the early days it was found difficult to give the journals and bearings more oil without too much getting on to the cylinder walls, because the latter were lubricated by the oil that was thrown on to them by the spinning action of the webs of the crank-shaft and by the connecting-rod ends, these latter dipping into a well of oil in the lower part of the crank-case. The modern method has overcome this difficulty. The cranks and connecting-rod ends no longer dip into the oil, for the latter drains away into a sump or reservoir below the base of the crank chamber. Thence it is passed through the oil pumps to the cylinder journals, which are under pressure to the crank-shaft journals. Sometimes it is conducted thence along ducts bored in the crank-shaft and
through the webs and crank-pins, whence it feeds the connecting-rod bearings, enough squirting out to splash on to the cylinder walls. Sometimes, a shallow trough is placed under each connecting-rod end, to hold oil to a certain depth and no more, and a scoop on the big end collects enough oil to effect the lubrication of the connecting-rod bearings and cylinder walls. The aim has been to secure definite lubrication of all moving parts, and, at the same time, to prevent oil being present on the cylinder walls in such quantities as will permit the piston to carry it up into the combustion chamber. Any oil present in the combustion chamber is burnt during the explosion, but, its combustion being imperfect, smokiness of the exhaust is the result. By reducing the oil on the cylinder walls to the minimum necessary for lubrication, smoking has been abolished, whilst clogging, or carbonizing, of the valves has been materially reduced.

Methods of carburation have also undergone improvement, so that the carburation shall not materially vary with varying engine speed. The only other feature in the engine that calls for mention is the method of cooling. With the introduction of the honeycomb type of radiator, by which the water is made to flow through channels an eighth or a sixteenth of an inch wide, the efficiency of the cooling system has been doubled because of the large amount of surface, in a given size of radiator, for dissipating the heat. A fan is generally employed, either situated behind the radiator and driven by the engine, or the flywheel is vaned so as to induce a current of air through the radiator.

To deal now with the transmission mechanism, the drive is taken through a clutch and gear-box as in the earliest days, but, for the final drive, chain transmission to the road wheels running on a fixed axle has largely given place to propeller drive on to a live axle. The leather-faced conical clutch, although still employed, has in many cases given way to the multiple-disk clutch in which a number of disks are being against each other, either flat in section, or (as in the Hec-Saw clutch) forming annular tapered grooves, are contained in an oil-tight box. These plates are capable of being separated laterally from each other when "out of gear," or brought into frictional contact with each other when it is desired to start the car. Metal-to-metal cone clutches, expanding metal shoe clutches, single metal plate clutches and coil spring clutches have all at some time found favour with designers wishing to avoid a leather clutch. Hydraulic and electro-magnetic clutches have also been tried, but these have not gained any vogue. In the matter of the gear-box, the sliding into mesh of the gear-wheels as employed by Levassor is still the standard practice, although that pioneer himself regarded the method as barbarous, and looked upon it as a mere temporary expedient. But details of the gear-box have materially improved. A single lever is usually employed for engaging any of the forward gears or the reverse, so that the mistake of simultaneously engaging a reverse and a forward gear is not possible. The spur-wheels are generally mounted in pairs on two sleeves, so that, by means of a selector mechanism that compels one sleeve to be brought to the neutral position before the other can be moved, no two gears can ever be engaged together. By means of "dog clutches," the clutch shaft can generally be coupled direct with the bevel-wheel driving the back axle, the "drive" on the highest gear being thus transmitted without passing through any spur-wheels. This reduces noise and frictional losses. Except for cars of great weight, chain transmission is fast dying out, the power being generally transmitted through a propeller shaft (with universal joints at one or both ends) to a bevel-drive on the back axle; such axle being divided into two revolving or "live" axles carrying the differential gear between them. The bevel-wheels, differential gear and live axles are enclosed and run in a lubricant.

Wire suspension wheels are growing considerably in favour, a saving in weight being thus effected. The liability of the pneumatic tire to deflation, through a puncture or burst,
MOTOR VEHICLES

has led to the introduction of detachable rims and detachable wheels. The detachable rim is borne on the periphery of the wheel (which is bonded) and secured in position by various methods. When the tire is punctured or damaged the rim and tire are removed bodily and replaced by a spare rim with its tire already in position and inflated, a change capable of being effected in five minutes or less. The detachable wheel is mounted upon a shell which fits over and is secured to a sleeve,

which latter turns and is secured upon the fixed axle. In the case of tire trouble, the wheel intact is removed from the sleeve (which in the case of a driving-wheel carries the driving fittings, the brake-drums, &c.) and a duplicate wheel is substituted. The pneumatic tire has undergone continuous improvement, particularly in the matters of the selection of the material and the proportioning of the strength of the "body" to the work which the tire is to be called upon to perform. Various methods have been devised for the prevention of skidding or "side-slip" on greasy surfaces, and, whilst certain mouldings on the rubber treads have proved advantageous, the method most adopted is that in which a large number of steel studs stand about a quarter of an inch above the surface of the tire.

It will be seen that the general lines of the car of 1889 have not required to be radically altered. Every detail has been improved so that the cars are more efficient, easier to control and manage, and infinitely more comfortable, but, in essence, Levasseur's scheme is as good to-day as it was when planned by him.

The steam car is made by five or six British manufacturers at the most, whereas the actual manufacturers of petrol cars in Great Britain numbered at the end of the year 1909 about seventy, whilst some four hundred other firms were actively engaged in the construction of cars and their parts, accessories and sundries. But the steam car appeals to those men who are or have been steam engineers, and to them the management of the steam generator and the burners constitutes no difficulty. The limitations under which the early steam car laboured have, in the main, disappeared, for the modern steamer can travel nearly as far without requiring to refill the boiler as a petrol car can travel without replenishment of the fuel tank. The electric car is still the luxury to be employed in towns and in covering short distances, for the weight of the accumulators has not been greatly reduced, despite sensational announcements made from time to time.

An interesting feature of the motor movement has been the steady growth in popularity of the motor cycle. The motor tricycle was developed up to the year 1903, and then gradually became displaced by the motor bicycle, which had been introduced in 1901. Motor bicycles gradually increased in popularity, until in numbers they were in excess of cars. The standard machines of 1909 had an air-cooled motor of one, two or even four cylinders (according to the choice of the riders) developing some 3 to 8 h.p. with magneto ignition and belt drive. The engine was usually started by the rider turning alongside the machine, and causing the machine to rotate the crank-shaft through the belt and pulley until the initial explosion was obtained, when he would jump into the seat. Trailers were employed at first for carrying passengers, but, the length of the combined vehicle being between nine and ten feet, a side-car,

placed at the side of the cycle and secured thereto by detachable fittings, largely displaced the trailer and also the "fore-car," in which the passenger was carried in a body placed in front of three- and four-wheeled cycles.

The rapid growth of the motor movement in Great Britain may be judged from the fact that by the end of September the number of motor vehicles of all kinds registered had totalled to 74,938, and by the 30th of September 1908, three years afterwards, to no less than 154,415. Of these, 137,923 were registered in England and Wales, 10,907 in Scotland, and 6,585 in Ireland. 74,405 were private motor-cars; 12,104 were trade motor-cars; 5,880 were public service vehicles and 65,026 were motor cycles.

A year later (Sept. 30, 1909) the figures showed a further remarkable increase, the total number of vehicles registered in the United Kingdom being 183,273, giving an increase of 29,358 in the year. Of these, private motor-cars numbered 84,849, trade motor-cars 15,181, public service vehicles 87,552, and motor cycles 75,900. The numbers registered in England and Wales were: 74,748 private motor-cars; 13,961 trade motor-cars; 8151 public service vehicles and 66,341 motor cycles, or 163,181 in all. The figures for Scotland were: 619 private motor-cars; 1045 trade motor-cars; 584 public service vehicles and 5296 motor cycles or 13,093 in all. The figures for Ireland were: 3935 private motor-cars; 164 trade motor-cars; 37 public service vehicles and 3353 motor cycles, or 7499 in all. In the year private motor-cars in the United Kingdom increased by 18.8% trade motor-cars by 25.4%; public service vehicles by 48.5% and motor-cycles by 15.7%.

It is possible to obtain a better idea of the number of motor vehicles in use from the returns of the commissioners of inland revenue. The total number of privately-owned cars for which licences were issued in 1908 was 48,019, of motor cycles 33,784, and of motor-driven hackney carriages 17,900. These figures may be compared with the registration figures already given for the year ending the 30th of September 1908. As accounting partly for the difference, a certain proportion of the registered vehicles (seeing that the figures include all vehicles in use on and after the 1st of January 1904, less those in respect of which the registrations have been cancelled) must have fallen into disuse and some vehicles will have been sold out of the country, whilst others will have been sold and re-registered with different authorities. But the life of the mechanism of a car, in one form or another, is of considerable length (there were, for instance, in use in 1910, as compared with 1906 an act of parliament authorized a census of production, which was taken in 1908, the statistics relating to 1907. These figures show that the output of complete motor vehicles in the United Kingdom in that year was 11,700 completed cars and chassis, and 3500 motor cycles, the total value of the productive work
In 1906 45% of the total consisted of motor-cycles, 49.3% consisted of pleasure vehicles, and 57% consisted of commercial vehicles, the proportion of pleasure vehicles having consistently risen in the four years.

The development of motoring and of the motor industry in the United States has been exceedingly rapid. As good roads multiply and extend the use of cars must be still further developed. The American farmer has discovered that he can make considerable use of the motor in connection with his industry, and this fact largely accounts for the demand for high-speed buggies, and for vehicles having ample clearance between the machinery and the road level.

In the early days of the movement the American taste inclined towards steam cars, and the mistaken view that the vehicle driven by an internal-combustion engine could never be made to run as fast as a steam car. Gradually, however, the petroleum engine became refined so rapidly that its equality with the steam engine in the matter of silence, together with its superiori, in the matter of simplicity and suitability for the man who is not an Engineer, soon created for it a popularity that prevents any material expansion of the business in steam cars. The makers of steam cars in America are able to cope with the major portion of the world's demand for this particular type of vehicle.

The introduction of the Dingley tariff, assessing an import duty of 45% ad valorem on motor-cars (in the classification of "manufactured metal"), added to a further charge of about 5% for freight, engendered a feeling of discontent and a desire to embark upon the manufacture of motor-cars, and in 1899 thirty manufacturers produced 5,600 cars. In 1909 the number produced by 200 concerns was 114,891. Set out in tabular form such figures as are obtainable are very striking:

The number of cars for 1906 is approximated and the number of cars and their value for the year 1910 are based upon the estimated output of the various manufacturers. In 1909, whilst the number of cars constructed showed an increase over the number for 1907, the total value had decreased owing to the commercial crisis of that year. In 1909 those manufacturers who had formed the Association of Licensed Automobile Manufacturers, agreed among themselves to secure the validity of the Selden patents, paid licence fees upon 94,891 cars, the remaining 20,000 cars being estimated as the output of the firms that did not belong to the association.

Of the 200,000 motor vehicles estimated to be constructed in 1910, 165,000 were to be petrol-driven pleasure cars, 30,000 were to be petrol-driven high-speed buggies, and 5,000 steam and electric carriages and commercial vehicles.

The history of the Selden patent may be given briefly. A patent was applied for on the 8th of May 1879 by George B. Selden, of Rochester, New York, for a gas compression engine for propelling road vehicles. A grant was awarded to him on the 4th of November 1895 for an improvement in road engines, and he claimed that any vehicle propelled by an internal-combustion engine, manufactured since that time, was an infringement of his rights under the patent. At the commencement of the year 1910, 71 manufacturers admitted this claim and paid to the Association of Licensed Automobile Manufacturers 1/4% of the catalogue price of their products as licence fees.

The imports of motor vehicles into the United States of America are not numerous, as will be seen from the following figures:

</table>

The exports rose from $599,927 in value in the year 1902 to $5,986,407 in 1907 with a falling off to $5,277,847 in 1908.

The number of cars in use in France had risen from 1,438 in 1901 to 2,655 in 1908. The export of French motor vehicles had risen in value from 4,290,000 francs in 1899 to 144,352,000 francs in 1907. In 1908 the exports fell to 127,000,000 francs, in proportion to about 145,594,000 francs had taken place. The imports of foreign motor vehicles to France rose from 476,000 francs in 1899 to 8,509,000 francs in 1907, and since that period there has been an annual decrease.

In Germany the number of motor vehicles of all kinds in use on the first of January in each year is shown in the following table:

<table>

The number of motor cars in use in the United States of America in 1909 was 7,277,847 (American)$\approx$ (European).
HEAVY COMMERCIAL VEHICLES

Heavy types of motor-cars are now widely employed for commercial purposes. The earliest British-built type was the steampowered wagon, and its evolution was largely engendered by the demands of the railway companies, which were in desperate need of a reliable, efficient means of transport to handle the huge volume of goods and passengers that were being handled at the time. The first steampowered wagons were used in the early 1820s, and by the 1830s, they were being used in increasing numbers. The wagons were originally designed to be pulled by horses, but as the technology improved, they were gradually replaced by steam engines. The first steam locomotives were built in the late 1820s, and by the 1830s, they were being used for both freight and passenger transport. The steam locomotives were more efficient and reliable than the horse-drawn wagons, and they were able to travel much faster. The first steam locomotives were built in the late 1820s, and by the 1830s, they were being used for both freight and passenger transport. The steam locomotives were more efficient and reliable than the horse-drawn wagons, and they were able to travel much faster. The steam locomotives were more efficient and reliable than the horse-drawn wagons, and they were able to travel much faster.

The working cost of a steam wagon with a 5-ton load, in Great Britain, inclusive of provision for interest on capital, depreciation and maintenance, varied from 7½d. to 9d. per mile run, on an average basis of 180 m. a week; with a trailer carrying another 3 tons the corresponding figures vary from 9d. to 1s. per mile run, according to nature of roads, gradients and fuel available. The inclusive working cost of a tractor, on macadamized roads, is generally about 15% less than for a 5-ton wagon, but a standard tractor cannot haul more than a gross load of 8 tons behind the drawbar—except on dry and level roads. On granite sets the extra vibration often causes undue wear and tear, unless the suspension of the tractor be very good.

Vehicles in which the power is derived from internal-combustion engines are commonly known as "petrol" vehicles. Petroleum spirit or 0-700 specific gravity is usually the fuel, but many are now supplied with spirit of 0-760 specific gravity; the range of boiling points is the criterion of satisfactory use—not the density. Petrol vehicles are, practically, stoutly-built motor-cars, and some of the models now in use have been developed from accepted designs of lighter types. There are, however, numerous manufacturers who construct solely for utility purposes. Below net loads of 2 tons, the petrol-propelled vehicle has a virtual monopoly of use in England; above that, it shares the trade with steam. A tabular statement of current working costs of approved petrol vehicles is published herewith.

Before proceeding to describe and illustrate representative types of vehicles, tractors and special machines, a brief summary of the outstanding points in the English statutes and orders which apply to heavy motor-cars may well be given. Any motor-car with an unladen weight in excess of 2 tons is held to be a "heavy motor-car," and a "trailer" means a vehicle drawn by a heavy motor-car, and the aggregate weight transmitted to the surface of the road or other base whereon the heavy motor-car or the trailer moves or rests by the several wheels attached to that axle when the heavy motor-car or trailer is loaded. The expression "weight" in relation to a heavy motor-car or trailer when unladen, means the weight exclusive of the weight of any water, fuel or accumulators used for the purpose of propulsion. All heavy motor-cars have to be registered with a county council, county borough, city, town, or other registering authority, and owners have to declare, on suitable forms, the unladen weight, the axle weight of each axle, and the diameter of each wheel. When a registration certificate is issued it bears these data, in addition to a statement of the width and the material of the type on each wheel, and the highest rate of speed at which the heavy motor-car may be driven. The owner, after registration, must cause to be painted, or otherwise plainly marked, upon some conspicuous part of the offside of the heavy motor-car, the registered weight unladen, and the registered axle weight of each axle, whilst, upon the near side of the heavy motor-car, he must similarly cause to be painted the highest rate of speed at which it may travel. Width of tires, which in no case may be less than 5 in., varies in relation to imposed load and wheel diameter, and a table of these is issued by the local government board. It is specified that the "width shall not be less than that
number of half-inches which is equal to the number of units of registered axle weight of the axle to which the wheel is attached.” Taking a wheel 3 ft. in diameter as a basis, the unit of registered axle weight is 7½ cwt.: this unit increases in the proportion of 1 cwt. per 12 in. increase of diameter, and decreases at the rate of 1 cwt. for every 6 in. reduction in diameter below 3 ft. The speeds at which heavy motor-cars may travel vary from 5 m. an hour to 12 m. an hour. Heavy motor-cars fitted with tires of a soft or elastic material may travel at higher rates of speed than if they were not so fitted.

Any motor-car used for trade purposes, but whose unladen weight does not exceed 2 tons, is allowed to travel as fast as 20 m. an hour, and is regarded as an ordinary motor-car.

Motor-buses.—The first double-deck motor-bus, of the type of which upwards of 1000 are in regular service in London, was licensed by the police authorities in September of 1904. The type of chassis employed is practically identical with those used for loads of 3 tons in the goods-haulage branches of the industry, and the accompanying chart, which is prepared from data exclusively collected by the Commercial Motor (London), indicates the growth in the totals since the inception of this departure in the public conveyance of passengers. The growth of motor-bus traffic has resulted in the displacement of some 25,000 horses and 2200 horse omnibuses, during the five years ending the 30th of June 1910, and it is estimated that there will be practically no horse omnibuses in London, except upon a few suburban routes, by the end of 1911. The inclusive working cost of a London motor-bus, with good management, varies between 9d. and 10d. per mile, which figures cover interest, depreciation and administration.

Successful provincial motor-bus undertakings, in the United Kingdom, are numerous, and those at Eastbourne, Keighley and Hull may be particularly mentioned of municipal undertakings, whilst the Great Western Railway Company alone has 150 such vehicles at work.

Motor-cabs.—Spasmodic efforts to introduce motor-cabs in London were made during the years 1905 and 1906. It was, however, only in the month of March 1907 that the General Motor-cab Company put the first 100 vehicles of its present large fleet into regular service. The growth of motor-cabs is indicated by the following numbers, for which the author is indebted to the Commercial Motor (London), and these are of vehicles licensed at the dates given: December 31, 1905; December 31, 1906, 96; December 31, 1907, 723; December 31, 1908, 2805; April 30, 1909, 3203; April 30, 1910, 4641. It is estimated that, at the 30th of June 1910, there are only 1200 horse-drawn hansoms in regular use, and not more than 2500 horse-drawn four-wheelers, in London. In 1904 London had a total of 11,055 horse-drawn hackney carriages, and two self-propelled hackney carriages. The London hiring rate for motor-cabs fitted with taximeters is: for the first mile or part thereof, 8d., subject to an additional charge at the rate of 2d. per 2½ minutes for any waiting time or travelling below the rate of 6 m. per hour; 2d. per additional 440 yds., or 2½ minutes of waiting or of travelling below 6 m. an hour; with the addition of 2d. per package carried outside, and 6d. for a bicycle and 6d. each for each passenger above two, for any distance. The horse-drawn hansom-cab is 1s. for the first 2 m., with 6d. for each additional mile or part of a mile, and with a charge of 6d. per 15 minutes of waiting, after the first 15 minutes completed. Taximeter cabs cannot be engaged by time in London, but horse-drawn cabs may be engaged at 2s. 6d. per hour for a hansom, and at 2s. per hour for a four-wheeler. The taxicab rates apply throughout the Metropolitan Police area, which in some directions extends as far as 20 m. from Charing Cross, but horse-vehicle rates (except those of time) are doubled for any distance beyond a four-mile radius.

Steam Vehicles.—Steam wagons may, generally speaking, now be divided into three distinct types, and these are distinguished chiefly by the particular form of final drive adopted by the designer. There are in general use by the well-known
The features which are common to all steam wagons of the second of these types are: vertical fire-tube or water-tube boiler; horizontal compound engine; two-speed gear; differential countershaft; and two sprockets which transmit the final drive, through chains, to the rear road wheels. The exact form which the boiler takes is a point which has considerably exercised the ingenuity of individual designers. In order to arrive at one that can be cheaply produced, efficient, simple of construction, easy to clean and repair, strong and reliable, and one which will not prime. The vertical type of boiler lends itself admirably to the general design of a steam wagon, because it takes up so little of the total length of the vehicle, whilst the fittings can be mounted in much more accessible positions than are possible with the majority of loco-type boilers. The efficiency is not, however, so high as is the case with the latter type. It may be generally stated that boilers of the vertical class, as used on 5-ton or 6-ton steam wagons, have a total heating surface of about 90 to 95 sq. ft., with about 4 sq. ft. of grate area, and the working pressure is from 200 lb to 225 lb per square inch. The usual and necessary fittings include: pressure-gauge; two safety-valves, two check-valves, and a blow-off cock. The feed water is normally supplied to the boiler by a plunger pump driven from the crank-shaft. The compound engine has all the valve motion completely enclosed and running in an oil-bath, and is provided with means whereby high-pressure steam can be supplied to the low-pressure cylinder, in order that extra power may momentarily be obtained. The change-speed gear pinions, cut from solid steel, are most often mounted on an extension of the crank-shaft, and mesh with machine-cut gear wheels which are mounted on the intermediate shaft, on which the differential gear is also mounted. The gears provide for two ratios of reduction from engine to road wheels; the higher one is for all ordinary running, and the lower one is for steep hills or for very bad roads. The outer ends of the differential shafts are fitted with chain sprockets, from which the drive is taken to the back wheels by means of chains.

The third type (fig. 9) of steam wagon is particularly business-like in appearance, and sound in construction and design. It is the outcome of many years' experience in the design of road locomotives, on the lines of which it is constructed. The loco-type of boiler is very economical in fuel consumption, and is a very efficient steamer. Comparing this type of boiler with the vertical type, the former can be made of a much lighter construction for a given rate of evaporation, and the smoke-box door at the forward end offers a most simple and easy means of access to the smoke tubes for cleaning purposes. No vertical boiler offers such ready means of effecting this operation. The engine, which is mounted over the boiler in this type, is in full view of the driver, and should it become necessary to make any repair or adjustment when on the road, this can easily be effected without grovelling under the wagon or removing any of the load. Objection may be raised to the position of the engine, on the score of its necessitating such a long chain drive to the back axle; this objection has not been sustained in practice, as many wagons employing this form of drive have been running for lengthy periods without giving any trouble on that score. The engine, which is a compound one, is close up to the source from whence it is supplied with steam, and consequently receives the steam in a much drier condition; there is less condensation in the main steam-pipe, because the length of this is reduced to a minimum. The short steam-pipes should tend to lessen the risk of their being broken from the sagging or twisting of the frame, a fault which is not unknown with vehicles having the engine a considerable distance from the boiler. This type, like types 1 and 2, also has two change-speed pinions, mounted on an intermediate shaft. These pinions may be of the sliding type, and may be operated by means of dog-clutches. The pinions mesh with two wheels that are mounted on a countershaft, on which is also fixed a chain-sprocket, from which the drive is transmitted, through a long chain, to a chain-wheel surrounding the differential gear mounted on the back axle. Traction-engine type of steering gear, with revolving carriages, is most generally adopted, and is rendered sufficiently rapid in its movement by suitable gear, operated by a diagonal shaft and wheel, from the driver's footplate.

The Sheppey steam-wagon, or "steam-gas" vehicle as it is sometimes termed, on account of the high degree of superheat to which the steam is raised, and which superheat gives to the steam many of the characteristics of gas, is shown in fig. 24, and, it may be seen, this wagon is entirely dissimilar to any other machine with which this article deals. The generator and paraffin burner are housed within the wagon proper and the temperature of the steam is controlled by a very simple form of thermostat. After leaving the engine, some of the heat in the exhaust steam is utilized to heat up the feed water before it is passed into the generator; the steam then passes through two condensers—one in front and one underneath the vehicle.

Another vehicle which embodies many novel and practical features is the new Leyland steamer, the construction of which includes one of the well-known Leyland fire-tube boilers, as shown...
in fig. 18, a three-cylinder, single-acting, vertical engine, and an all-gear drive to the rear wheels.

Boilers.—The locomotive type of boiler is shown diagrammatically in figs. 12-15. The first of these four diagrams illustrates the

of heat is provided in the mass of the heated tubes, and the rapidity of flame application by the burner, and not in a mass of heated water. The steam, too, is very highly superheated, and necessitates the use of a specially-designed engine with mushroom valves.

Belpaire type of fire-box outer shell, and, by its side fig. 13 shows the older form of construction. The Belpaire fire-box is a development of recent years, and its undoubted superiority over the older type is meeting with increasing recognition amongst boiler makers. The sloping back plates of the fire-box, as shown in fig. 15, are intended to give plenty of room for the housing of the change-speed gearing without undue lengthening of the vehicle or reduction of the area of the fire-grate.

Fig. 16 shows one form of paraffin burner, which type is used in conjunction with semi-flash boilers. The fuel is first vaporized, by being passed through a heated coil.

Steam Engines for Vehicles and Tractors.—The Bentley superheated steam engine, which is fitted to Colonel Crompton's tractor, is shown in fig. 20.

It has four high-pressure cylinders, and four in which low-pressure steam is operative. In a number of tests which were made

Figs. 12-15.—Fig. 12 shows the Belpaire type of fire-box construction as compared with the more usual type shown in fig. 13. Fig. 14 and fig. 15 show the form of locomotive boiler fitted by Sidney Straker & Squire, Ltd. The back of the fire-box is sloped so as to accommodate the gear shafts without unduly lengthening the frame.

Figs. 16, 17, 18.—Fig. 16 shows the Toward Vertical Boiler, fig. 17 Alley & MacLellan's Sentinel Water-tube Boiler, and fig. 18 the Vertical Smoke-tube Boiler fitted on Leyland Steam Wagons. The smoke tubes in the last-named boiler are provided with copper sleeves to prevent corrosion.

Figs. 16, 17 and 18 show vertical boilers made, respectively, by Toward, of Newcastle, Alley & MacLellan, of Glasgow, and the Leyland Co., of Leyland. The smoke tubes of the last-named boiler are provided with copper sleeves, the object of which is the prevention of corrosion of the outer surfaces of the tubes. All-copper tubes have been tried, but they are too soft to withstand the abrasive action of the fine particles of coke which are ejected from the fire.

In flash or semi-flash boilers, or steam generators, such as are fitted by the Duracoq-Serpollet Co., the Shppee Motor Co., of York, and to the tractor made to the designs of Colonel Crompton, C.B. (fig. 26), only a very small volume of water is at any time in the tubes. The tubes are exceptionally strong and thick, and they are made of cold-drawn steel; the water is only forced into them for stroke of the engine. The essential difference between this class of generator and any ordinary motor-wagon boiler, whether of the water-tube or fire-tube patterns, is that the reserve
with an engine of this type it was found possible to work it on an expenditure of 13 lb of water per brake-horse-power hour. Another interesting superheated steam engine is the two-cylinder, double-acting engine made by the Sheppee Co. and illustrated in fig. 21. In this engine the cam-shaft by which the steam and exhaust valves are operated is situated midway of the cylinders' length, and is driven by bevel gearing from the crank-shaft. Fig. 22 shows a combined steam and hand-operated water pump, for use in conjunction with either of the engines mentioned.

**Steam Tractors.**—The great popularity which the light steam tractor enjoys is undoubtedly due to its extreme usefulness in cases where the employment of steam wagons could not prove remunerative. For brickmakers, builders, market gardeners and a host of others whose business demands that separate loads of heavy material must be moved from place to place without involving terminal delays, the tractor offers a simple and ready means of attaining the desired end. The first cost is comparatively low, and such a "steam horse" can be kept constantly at work if there is sufficient demand. A steam tractor is economical and efficient; it can be used on roads where a steam wagon would be impracticable on account of its great axle weight, and, when not used for hauling, it can be put to other work such as driving pumps or builders' machinery, or for a host of other purposes requiring a portable power installation. The fact that the motor is separate from the wagon, or trailer, which conveys the load, and can haul a loaded trailer to its destination, leave it, and return with, or for, another loaded trailer, without waiting for the first load to be unshipped, not only makes this class of motor extremely useful to agriculturists and others, but it makes for greater efficiency, in a large number of cases, because the power unit is not allowed to stand idle during the loading or unloading operations. Another vital point is the low annual cost of maintenance.

Since the passing of the 1903 Motor Car Act, and the coming into force of the 1904 Heavy Motor Car Order, many of the well-known makers of road locomotives have turned their attention to the production of a machine which would come within the prescribed constructional limits, and would meet popular demand. These machines are built on proved traction-engine lines, but with all the parts of suitably reduced size so far as is consistent with strength and the work which the machines are
called upon to perform. The locomotive type of boiler, with large fire-box, a heating surface of about 65 sq. ft., and a grate area of some 3 sq. ft., is used by the leading makers.

Some of the early tractors were fitted with single-cylinder engines, but, although this type is still supplied by several makers, the more general practice is to provide a compound engine, with a multiplying valve which admits high-pressure steam into the low-pressure cylinder, thus enabling the engine to develop considerably more than its normal power for short periods. The engine is mounted over the boiler, with its crank-shaft at right angles to the axis of the barrel. Two changes of gear ratio are usually provided; one for normal running, and a lower one for very soft ground or steep hills. The driving axle is of the differential or live type, and provided with means for locking the compensating gear and rendering it inoperative when necessary, as would be the case if one driving-wheel were on hard ground and the other one on soft or greasy ground.

A winding-drum is fitted, and this may be driven by the engine without, at the same time, driving the tractor: this result is attained by making the drum free on the axle but providing means of securely locking it thereto when desired. A flywheel is generally fitted to one end of the crank-shaft, and this may be used for driving external machinery.

Many makers have recently given much attention to the improvement of the spring-suspension systems of their respective machines, and chief amongst these is William Foster & Co., Ltd., of Lincoln, in which company's "Wellington" tractors the effective spring base has been so vastly increased that it may safely be termed the most stable of steam tractors. The life of all the working parts of a tractor may be considerably lengthened by the elimination of road shocks, or the prevention of their transmission, through the gearing, to the engine and the boiler plates. Foster's tractor is illustrated, in diagrammatic form, in fig. 25.

An ingenious machine of the tractor class is that built to the designs of Colonel Crompton, and shown in fig. 26. This machine is intended for military purposes, or for operation in undeveloped countries. Steam is generated in a "semi-live" boiler, or is used expansively in a four-pair, diagonal-compound engine of the type shown in fig. 20. A two-speed epicyclic gear is enclosed by the flywheel casing, and the power is then transmitted, by worm gearing, to a differential counter-shaft, and from sprockets on the ends of this shaft the drive is finally transmitted to the 7 ft. diameter road wheels by means of side chains. In this tractor, very long bearing springs are employed, and these are situated below the axle, so that, instead of the springs resting on the axle boxes, the whole frame and the power plant is suspended from the axle boxes. When hauling a load, the winding cable is permanently secured to the drawbar, and, when the machine becomes "hot" or is otherwise unable to haul its trailer directly by the drawbar, a single bolt may readily be removed from the drawbar, and the winding cable may then be paid out as the tractor proceeds alone. The trailer may then be hauled up by means of the cable. The average of a number of tests with this machine, made while hauling a gross load of 8 tons, showed that its barrows consumed from -65 to -85 of a gallon of shale oil for each mile travelled, and that the consumption of water was at the rate of -5 gallon per mile. The gross weight of the machine, with sufficient fuel and water for well over 100 m. of running, is about 7 tons.

**Vehicles Driven by Internal-Combustion Engines.**—The general principles of the working of a steam engine are better understood than are those of the gas or oil engine, owing to the wide use of the former class of prime mover since the early part of last century, but it is beginning to dawn upon the public at large that the internal-combustion engine, or the "petrol" motor, as it is more popularly termed by those who talk or write about motor vehicles, is even more simple than the steam engine.

The fundamental reason for the use of the words "internal combustion" is that the fuel, in the case of the petrol engine, is burnt (or fired) inside the working cylinder, whereas it is burnt externally in the case of a steam engine, *i.e.* underneath the boiler or generator. The number of units of heat which can be turned into useful work is very much greater in the case of internal combustion than of external combustion, the efficiency of the petrol engine in this respect being, on the average, about three times as great in practice as is found to be the case with typical steam engines other than those that highly-superheated.
steam is used, and where the whole of the parts are maintained in the best condition. The amount of petroleum spirit, or of paraffin, required to propel a steam vehicle 1 m. would, other conditions being equal, propel a vehicle fitted with an internal-combustion engine over a distance of 3 m.

The essential parts of any internal-combustion system are: the carburettor; the engine; the radiator; the clutch; the change-speed gears and the final transmission. The carburettor is a vessel in which the liquid fuel is converted into a combustible gas or vapour, for, as there is no connexion to any gas main, the ordinary petrol engine has to make its gas "on the premises." The production of the gas is automatic, and calls for practically no attention from the driver, because, once the engine is started, the necessary aspiration to draw through the correct quantities of air and fuel is provided by the action of the valves and pistons.

A smart turn of the starting handle is required to set the pistons and crankshaft in motion, so that an initial supply of the combustible mixture may reach one of the cylinders. This first charge of gas is automatically ignited by an electric spark, the current for which is furnished and controlled without the necessity for any hand regulation, and there is then nothing further for the driver to do, as regards power, except to move a convenient lever which opens or closes a "throttle" valve between the cylinders and the carburettor.

An internal-combustion engine would get very hot if no precaution were taken to cool it, and it is usual to surround the cylinder with water spaces. These spaces are called jackets, and the water is forced through them, either by a pump or by thermo-siphon (natural circulation) action. It is expedient to keep down the weight of water, and for that reason pipes, tubes or small boxes are built up in such a manner that a large cooling surface is exposed to the air. A fan, which is driven from the crankshaft of the engine by gear or a belt, is employed to aid this cooling by reason of the increased volume of air that passes round the outside of the components of the radiator members. The general scheme is the same, both for heavy and light motor-cars.

It is very important that the driver should have a convenient means of separating the engine from the driving mechanism, and of putting the two in connexion again, whenever it becomes necessary, without jar or shock. The common practice is to use a leather-faced, circular member with a coned face, and to control the amount of "grip" between this member and a corresponding enclosing member attached to the engine fly-wheel by means of a pedal and springs. When the driver wishes to disengage the two members, he has merely to depress the foot lever. It will be clear that a clutch of this description can be made to engage without any difficulty, there being no fixed positions or steps such as one associates with the ordinary jaw-clutch, and this gradual application of the load can only be accomplished by the aid of two or more surfaces in frictional contact, and by the holding together of these surfaces by the pressure of one or more strong springs. The Holb-Shaw multiple-disk clutch gives very good results, and is easy for drivers to use in traffic.

An internal-combustion engine cannot develop power unless the crank-shaft can rotate at a relatively high number of revolutions, and the rate of doing work is lowest when the angular velocity is at its minimum. It is, therefore, necessary to introduce a system of levers between the engine and the road wheels, in order to permit the number of revolutions of the crankshaft to be maintained when hill climbing, or when the vehicle is carrying a heavy load, and the common practice is to introduce three or four sets of different sizes of toothed wheels, any pair of which can be put into engagement by the movement of a single lever, which lever is placed near the driver's right hand as a rule. The lowest of these gear ratios, i.e. the one which allows the crankshaft to make the greatest number of revolutions to one revolution of the road wheels, is required for starting purposes, and the highest gear ratio, i.e. the one which allows the road wheels to make the greatest number of revolutions in relation to those of the crankshaft, is employed for high-speed travelling on the road. From the last change-speed shaft the power must be transmitted to the road wheels through a differential gear and through one or other of the types of final drive which are now employed by representative makers. The great distinction from the axle of a horse-drawn vehicle is that there must be both a mechanical connexion, yet a differential action, between the two back wheels. The wheels on horse vehicles revolve loosely on the axle, and one can overrun the other at curves, but the special device known as the "differential gear" has to be introduced into all motor vehicles between the...
sprockets on the ends of the differential shaft to chain rings which are bolted to the rear road wheels. Figs. 27, 28 and 29 show typical vehicles, ranging in load capacity from 30 cwt. to 6 tons, on which the side-chain method of final drive is adopted. One of the chief advantages of the side-chain drive lies in the fact that there is, with it, less weight below the springs than with any other form of final drive. The only parts below the springs are: the fixed back axle; the chain rings (bolted to the road wheels); the road wheels themselves; the road-wheel brakes and part of the weight of the chains. The differential gear and chain sprockets are carried in a countershaft casing, which is securely bolted to the main frame.

Fig. 29.—A typical Six-ton Petrol Wagon Chassis, by Commercial Cars, Ltd., Luton.

In a number of very successful vehicles the final drive is transmitted by means of spur pinions. These are mounted on the ends of bevel-driven differential shaft, and mesh with internally toothed or externally-toothed gear rings on the road wheels. Milnes-Daimler and De Dion commercial vehicles are amongst the machines on which the internally-toothed form of gear is employed, whilst Ryknield is the most representative vehicle embodying the externally-toothed form of final drive. The direct drive, from the ends of the differential shaft, as is shown in fig. 30, is another type of final transmission that has met with a considerable amount of success, particularly on the Leyland machines of five-ton and six-ton capacity. The differential gear and the bevel-drive reducing gear are both enclosed within a casing that is bolted to a fixed back axle; the ends of the driving shaft pass through tunnels in the axle body; and claw pieces on the outer ends of the differential shaft engage with similar claws on the road-wheel hubs. The two last-named forms of gear are highly efficient, provided the pitch and shape of the teeth are carefully considered and the designs provide for the encasing of all the pinions and gear rings.

Fig. 30.—The Back Axle of the Leyland Six-ton Petrol Wagon.

The only other type of final drive which is used to any great extent for commercial motors is that which employs a hardened and ground steel worm meshing with a machine-cut phosphor-bronze worm wheel which is bolted to the differential-gear cage of a live back axle. The employment of this type of gear for the final transmission on commercial motors generally leads to increased efficiency, on account of the ease with which all the parts can be enclosed in an oil-tight casing. It also gives silence of running. The strongest advocate of the worm drive for heavy vehicles is the Guildford manufacturer, Dennis Bros., Ltd., one of which company's machines is illustrated in fig. 31. Although there are many difficulties in the matter of the manufacture of worm gearing, they are not insurmountable, and, given proper attention at the hands of the designer, followed by accurate workmanship, probably no other mechanical means of transmitting power can approach it for smooth and silent operation. Both thrust bearings on the worm shaft should be on one side of the worm, to avoid lack of truth in meshing if any heating occurs between the worm and the wheel. There are many examples of the worm drive to be found in London on public-service passenger vehicles, and also on delivery vans. One of the great charms of this type of transmission is that a very large gear reduction may be obtained without making the worm wheel unduly large in diameter; this is an important factor in the design of a back axle, as every inch of road clearance is of value for operating on rough country roads. As a large gear reduction is thus rendered possible on the back axle, it will readily be understood that the change-speed gear-box may be made considerably smaller than would be necessary for a bevel-driven live axle, where a large gear reduction is not permissible, both on account of its size and because such a gear would be very noisy in its working.

Fig. 31.—A typical Worm-driven Live-axle Chassis, by Dennis Bros., Ltd., of Guildford.

Although the use of tooth wheels is still the only practical method of obtaining variable transmission for motor vehicles, the fundamental defects of transmission in this way are inherent to the system and must always be present; they are now less apparent, thanks to the remarkable improvement which has taken place in the use of suitable materials and improved design.
It is still the hope of some manufacturers that a form of infinitely variable change-speed device will be produced, which will replace the step-by-step movement of toothed gearing; the two chief directions in which this has been attempted are electrical and hydraulic. Of these two, electrical devices are really step by step, and the hydraulic method is apparently the only one that permits of infinite variation. Enormous sums of money have been spent in the search for an effective hydraulic gear; the work of Hall, Pittler, Jannay, Hele-Shaw, Renault and others is, perhaps, the best known. It must be confessed, however, that in 1910 none of these gears could be said to be on the market for motor vehicles, although hydraulic gears were being successfully applied in connexion with other problems, such as the steering of ships, the movement of turrets, &c.

Electrical transmission systems, too, have been tried, and appear to have been attended with more success than those of the hydraulic type. Such systems include vehicles which carry heavy batteries of accumulators, the current from which is utilized for the driving of the vehicle by means of electric motors. Other variations include the Hallford-Stevens system, shown in fig. 32, in which it may be seen the petrol engine drives a dynamo, and the current is then caused to drive an electric motor at each side of the chassis. Each motor drives one of the back road wheels, through a worm and worm wheel. The changes of vehicle speed are effected by altering the method of grouping the electrical windings of the dynamo and motor field-magnets and armatures. This system of control is known as the series-parallel, and is effected by a single lever, which actuates a mechanical switch, or “controller.”

In one of the most-recently-introduced petrol-electric systems—the “K.P.L.” system, as worked by the Daimler Co., of Coventry—each of the rear road wheels is provided with a separate power unit, consisting of a four-cylinder petrol engine, which is direct coupled to a dynamotor, the armature of the latter being coupled to a worm which meshes with a worm wheel attached to the road wheel. A small electrical storage battery forms part of the system, and this receives the excess of current from the dynamotors when the whole power of the engine is not required for the propulsion of the vehicle. When the machine is being driven up a steep incline, or when it is required to travel in a reverse direction, the battery may be called upon to supply current to the dynamotor, and, in this manner, the power of the engine is augmented by the dynamotors’ working as electric motors.
Still another petrol-electric system is that invented by Mr. Thomas. In this system, which is at the same time the simplest and most practical form of petrol-electric transmission, two dynamos and an epicyclic gear are employed so that the electrical load is at no time greater than one half of the total load; consequently, the risk of a “burn out” of the windings, as the result of sudden and unforeseen periods of overload, is materially minimized.

**Special Applications.**—Amongst the special applications of the petrol-engined commercial vehicle is the motor fire-engine, which has brought to the front in this branch several enterprising motor manufacturers, amongst whom Dennis Bros., of Guildford, Halley, of Glasgow, and Leyland, of Preston, are prominent. The general construction of the chassis closely follows the lines of other petrol vehicles of equal load capacity, but the gear-box tail-shaft is prolonged to the after-end of the machine, and is direct-coupled to the rotary member of a multi-stage centrifugal pump. In the Dennis fire-engine, the vacuum which is necessary in order to lift the water in the suction hose is obtained by means of priming the pump chamber, further assisted by a water ejector and a small water tank which is carried on the machine. This machine is shown in fig. 33, whilst fig. 34 shows the successful motor fire-engine built by Halley’s Industrial Motor Company & Co. In the latter machine, as well as in the Leyland and other fire-engines which employ centrifugal pumps, the vacuum is created by means of reciprocating air pumps. These machines have given very satisfactory results in the hands of practical firemasters, in various parts of the United Kingdom and abroad. Merryweather and Shand-Mason, who were formerly builders of steam fire-engines, now also build petrol-engined machines, these makers favouring reciprocating water pumps.

Other special applications of the internal-combustion motor are for grass mowing and rolling, and for road mending and rolling gravel paths, &c. One of the latter type of machines is shown in fig. 35. In this machine a petrol or paraffin engine drives a water-ballast roller through the medium of a clutch, a simple form of change-speed gear-box, and a single roller chain. The leading roller, by which steering is effected, is also filled with water, in order to obtain the dead weight necessary for rolling. Marshall, Sons & Co., Ltd., of Gainsborough, Thornycroft, of Basingstoke, and Broom & Wade, of High Wycombe, have also produced special machines for agricultural and military purposes, and one of the smallest tractors built by the first-named maker is shown in fig. 36. The engine is one of the two-cylinder type, consuming paraffin fuel, and driving the live back axle through a substantial gear-box and a final drive of the externally-toothed type. Such a machine is well below the weight limit for heavy motor-cars. Fig. 37 shows a more powerful oil tractor by Thornycroft. This machine is the same type which was so successful in the tractor trials promoted by the British War Department in March 1909. It is capable of hauling a gross load of seven tons practically anywhere, and even of lifting that load vertically by means of its winding cable. The engine has four cylinders, and the fuel may be paraffin, alcohol or crude oil.

**MOTRIL,** a town of southern Spain in the province of Granada, at the foot of an offshoot of the Sierra Nevada and on the edge of a rich alluvial plain, about 1 m. from the Mediterranean and 40 m. S.S.E. of Granada, with which it is connected by a good carriage road. Pop. (1900), 18,528. The climate is semi-tropical, and the sea or plain of Motril has been found peculiarly adapted for the culture of sugar-cane and sugar-beet. In the district, and especially at Salobreña, 3 m. west, there are numerous sugar-factories; cotton is also grown and manufactured, and alcohol, flour, esparto grass, and other products are exported. The neighbourhood is rich in copper and lead; and copper is also found. Motril itself is a port of the second class, but the anchorage at Calahonda, 43 m. south-east, is much better. Grapes, barley, esparto grass, dry figs, almonds and zinc are exported.

**MOTT, LUcretia [COFFIN] (1793-1880),** American reformer, was born at Nantucket, Massachusetts, on the 3rd of January 1793. She was descended on her mother’s side from Peter Folger, one of the first settlers of Nantucket, and the grandfather of Benjamin Franklin; her father’s ancestors, also, were of the first settlers of Nantucket. At thirteen she was sent to a Friends’ boarding school, at Nine Partners, near Poughkeepsie, New York, where James Mott (1788-1868), who like her was of old Quaker stock and whom she married in 1811, was then a teacher. In 1810 Mott entered the employ of Lucretia’s father in Philadelphia, but the business was not successful and in 1817 Lucretia opened a small school under the care of the Pine Street Monthly Meeting, but gave it up a year afterwards and in the same year was recognized by the Friends as an acknowledged minister. Her husband had as early as 1813 exposed the caitious Eliza Hicks against the “Orthodox” Friends, and in 1825, when the Hicksite divided, Lucretia joined the Hicksites. Hicks’s teachings on slavery had impressed both James and Lucretia; in 1830 James gave up a lucrative cotton commission business that he might not profit from the products of slave labour; and both took an active part in the campaign against slavery. About 1840 Mrs Mott also took up the cause of woman’s rights. On lecturing tours she and her husband travelled as far west as Indiana and into Maryland and Virginia. In 1848 she addressed the Anti-Sabbath Convention in Boston, and with Elizabeth Geddy Stanton, whom she had first met in 1832 as a Vokesian, “to discuss the social, civil and religious condition and rights of women,” which met at Seneca Falls and passed a “Declaration of Sentiments,” modelled on the Declaration of Independence. Her husband, who was prominent among the founders of Swarthmore College (1864), died in Brooklyn, New York, on the 26th of January 1868; and Mrs Mott died on the 11th of November 1880 near Philadelphia.

See James and Lucretia Mott: Life and Letters (Boston, 1884), edited by their granddaughter, Mrs Anna Davis Hallowell.

**VALENTINE, (1836-1885),** American surgeon, was born at Glen Cove, New York, on the 26th of August 1835. He graduated at Columbia College, studied under Sir Astley Cooper in London, and also spent a winter in Edinburgh. After acting as demonstrator of anatomy he was appointed professor of surgery in Columbia College in 1809. From 1811 to 1834 he was in very extensive practice as a surgeon, and most successful as a teacher and operator. He tied the innominate artery in 1818; the patient lived twenty-six days. He performed a similar operation on the carotid forty-six times with good results; and in 1827 he was also successful in the case of the common iliac. He is said to have performed one thousand amputations and one hundred and sixty-five lithotomies. After spending seven years in Europe (1841-1841) Mott returned to New York and founded the university medical college of that city. He translated A. A. L. M. Vieuxpeau’s Operative Surgery, and was foreign associate of the Imperial Academy of Medicine of Paris. He died on the 26th of April 1865.
MOTTEUX, PIERGE ANTOINE (1663-1718), English translator and dramatist, of French parentage, was born at Rouen on the 25th of February 1663. After the revocation of the Edict of Nantes he settled in London with his kinsman and godfather, Paul Dominique Motteux. He acted as an auctioneer of pictures, and in 1726 he had a shop in Leadenhall Street for the sale of lace, stuffs, Chinese and Japanese commodities, duly advertised in the Spectator by his friend Richard Steele. He had not been six years in England when he obtained sufficient mastery of the language to edit the monthly The Gentleman's Journal, which contained verses by himself and by the chief wits of the day. In 1693 he edited the third book, hitherto unpublished, of Thomas Urquhart's translation of Rabelais, and in the next year printed the first and second books of Urquhart's translation. In 1694 he completed Urquhart's work by a translation of the fourth and fifth books, which, although not to be compared with the racy, nervous writing of Urquhart, shows a perfect mastery of colloquial English and an intimate and adequate sense of Rabelais's meaning. The complete translation appeared in five volumes in 1693-1694, and was reprinted as The Whole Works of Francis Rabelais, M.D. (2 vols., 1708), described as the work of "Sir T. Urchard, Knight, Mr Motteux and Mr Whibley, who play, a Battle," in 1797. The Loves of Mars and Venus was reprinted in 1703, and in 1704 followed The Loves of Mars and Venus. He wrote other works for the stage of no great consequence. More important than his dramatic work is his History of the Renowned Don Quixote de la Mancha (4 vols., 1701; 2nd ed., 1712), "translated from the original by many hands and published by Peter Motteux," one of the most masterly and spirited translations in English. His later years appear to have been given to the shop in Leadenhall Street. He was murdered on the 18th of February 1718 at a house of ill fame in Star Court, near St. Clement's Church, London, under circumstances which have never come to light. The manner of his death was no criterion of his life, which appears to have been sober and decent.

An excellent life by Henri van Laun is prefixed to the 1880 reprint (4 vols.) of J. G. Lockhart's edition of Motteux's Don Quixote. See also a preface note by Charles Whibley in vol. iii. of Sir T. Urquhart's Rabelaisis (Tudor Translations, 1900), reprinted from a rare 1693-1694 edition.

MOTTEVILLE, FRANCOISE BERTAUT DE (c. 1621-1680), French memoir writer, was the daughter of Pierre Bertaut, a gentleman of the king's chamber, and niece of the bishop-poet Jean Bertaut. Her mother, a Spaniard, was the friend and private secretary of Anne of Austria, wife of Louis XIII. At the age of seven Francoise was also made a member of the queen's household and given a pension. The influence of Richelieu, however, who wished to separate the queen from her Spanish conceptions, exiled mother and daughter to Normandy; but in 1639 the young girl was married to Nicolas Langlois, seigneur de Motteville, president of the Chambre des Comptes of Rouen. He died two years later at the age of eighty-two, and in 1642 the queen summoned Mme de Motteville to court, being now her own mistress by the death of Richelieu and Louis XIII. Through all the intrigues and troubles of the Fronde Mme de Motteville preserved the honourable reputation of being devoted to her mistress without any party ties or interests. Some letters of hers are preserved—especially a curious correspondence with "La Grande Mademoiselle" on marriage, but her chief work is in Memoires, which are in effect a history of Anne of Austria, written briefly till the day of Mme de Motteville's return to court, and then with fullness. They give a faithful picture of the life of the court at that time.

The best edition of her Memoires is that of M. F. Riaux (2nd ed., Paris, 1891, 4 vols.), containing the essay by Sainte-Beuve from vol. v. of his Causeries du lundi. The Memoires were translated into English by J. W. Whalley by K. P. Whibley (2 vols., 1897). For details concerning her family see Recherches sur Madame de Motteville et sur sa famille, by Charles de Beaurepaire (Rouen, 1900).

MOTT, FELIX (1856— ), German conductor and composer, was born near Vienna, and had a successful career at the Vienna Conservatoire. He became known as a gifted conductor of Wagner's music, and in 1876 was engaged for the Ring des Nibelungen at Bayreuth. From 1881 to 1903 he was conductor at the Carlsruhe Opera, and made a wide reputation for his activity there, particularly in producing the works of Wagner and Berlioz. In 1886 he directed the performance of Tristan und Isolde at Bayreuth. In later years he visited London and New York, and became known as one of the most brilliant conductors of his day; and in 1904 he was made a director of the Academy of Music at Berlin. He composed some operas, of which Agnes Bernauer (Weimar, 1880) was the most successful, and numerous songs and other music.

MOTTO (an Italian word, from Late Lat. mutum, a low sound, a muttering, a stammer, to mutter; the Latin word also gives fr. mot, word), a "legend" consisting of a significant phrase or sentence, sometimes even of a single word attached to an emblem or device, and, in heraldry, placed on a scroll below the achievement or above the crest. Mottoes express sometimes a sentiment, a favourite principle, emphasize the meaning or symbolism of the emblem or device, and, in heraldry, often allude to one or more of the "charges" in the coat of arms, &c.

There are many publications which give lists of some of the best-known mottoes, such as F. Adolphe, Book of Family Crests, 1856: Wachbourne, Book of Family Crests (2 vols., 1882); Chassagnet and Tannian, Dictionnaire des devises historicques et heraldisques, &c. (1878); Baudouin's Dictionnaire des mots, mots-figés, mots-buts, mots-embellis, mots-amendés, etc., of 1857; and the large work by J. de Hastière, Mottees, Crests, and National emblems, of 1841 (3 vols., 1888). Gatefield's Guide to Printed Books and MSS, relating to Heraldry (1892) contains a bibliography.

MOTYA, an ancient Phoenician settlement in Sicily, on a low island [mod. S. Pantaleo], 5 m. north of Lilybaeum [mod. Marsala]. It was the centre of the Phoenician trade in Sicily. It was inaccessible from the mainland by a mole, which is still seen as a breakwater for the ships. The line of the city was formed by rectangular blocks of stone without mortar, and may still be traced all round the coast, with two gates, one on the north towards the mole, which is still in part preserved, and one on the south. The date of its foundation is uncertain. In 396 B.C. it was taken after a desperate struggle (which, owing to the height and strength of the houses, continued even after a breach had been made in the city wall) by Dionysius of Syracuse, but recovered in the next year: it was, however, abandoned by the Carthaginians, and its place taken by Lilybaeum on the mainland.

MOUCHE, AMÉDÉE ERNEST BARTHÉLÉMY (1821-1892), French astronomer, was born at Madrid on French parents on the 24th of August 1821. At the age of sixteen he entered the naval school at Brest, and after serving with distinction in various ships, was appointed in 1856 to the command of the "Bisson." Towards the close of the Franco-Prussian War he made an admirable defence of Brest, and his organization of the French expedition to the island of St Paul to observe the transit of Venus in 1874 obtained his election to the Academy of Sciences and his promotion as commander of the Legion of Honour. On the 27th of June 1878 he succeeded to Urbain LeVerrier as director of the National Observatory of Paris, and was raised to the rank of rear-admiral. The fourteen years of his directorship were marked by a great increase in the activity of the institution. The observatory grounds were enlarged; two powerful instruments of the novel kind as coude equatorial were installed; a spectroscopic department was established, and the gigantic task of re-observing all Lalande's stars was completed. He published twenty-one volumes of Annales, as well as the first two volumes of the great Catalogue de l'observatoire (where he founded the Monthly Astronomer, 1854). He was an enthusiastic advocate of practical education, and was the author of several textbooks on the subject. As a member of the Académie des Sciences, and president of the Académie des Jeunes Officiers, he became a leader of the reformist party in the French navy. He was made an officer of the Legion of Honour, and was the author of several works on astronomy, including a translation of Le Verrier's Elements of Astronomy, and a treatise on the History of Astronomy. He was also the author of several works on the history of navigation, including a translation of the work of the Spanish navigator Alonso de Santa Maria. He was the author of several works on the history of navigation, including a translation of the work of the Spanish navigator Alonso de Santa Maria. He was also the author of several works on the history of navigation, including a translation of the work of the Spanish navigator Alonso de Santa Maria. He was also the author of several works on the history of navigation, including a translation of the work of the Spanish navigator Alonso de Santa Maria.
autographic picture of the entire sphere containing more than fifty million stars, which should faithfully record in future ages the state of the sky at the end of the 19th century. Although he did not live to see its completion, he had the satisfaction of knowing that the ultimate success of this vast scheme was assured. He died suddenly at his country seat at Wissous, near Antony, on the 25th of June 1892.

(A. M. C.)

**MOUFLON, or MOUFLON**, the wild sheep (Ovis musimon) of Corsica and Sardinia, where it is now very local. The ewes are either hornless or provided with quite small horns, the hornless form being probably characteristic of one island and the horned of the other. The rams carry good horns, and in summer show a conspicuous light saddle-shaped mark on the otherwise dark-coloured coat. The Armenian mouflon (O. orientalis), of Persia, Armenia, and the Troodos range of Cyprus, is typically a larger and redder sheep, with the horns curving in the reverse direction; but the Cyprian race is small. (See Sheep.)

**MOULD (1) (O. Eng. molde, from a Teutonic root meaning to grind, reduce to powder, cf. "meal").** Loose fine earth, rich in organic matter, on the surface of cultivated ground, especially the made garden soil suitable for the growth of plants. In the sense of a furry growth, consisting of minute fungi found on animal or vegetable substances exposed to damp, the word may be either an extension of "mould" earth, or an adaptation of an early "mūl," with an additional d due to "mould." "Moul" is a Scandinavian word, cf. Swed. mögla, to grow musty, and the Eng. colloquial "muggy." (2) A form or pattern, particularly one by means of which plastic materials may be made into shapes, whence "moulding," the form which the material so shaped takes. The word comes through the O. Fr. molde, molle, from Lat. modulus, a measure, or standard. The English "model" is another derivative of the same word.

**MOULDINGS**, the term in architecture for the decorative treatment given to projecting or receding features in stone, wood and other materials, by means of curved forms, whereof those features are accentuated and varied owing to the play of light and shade on the surfaces. The principal characteristics of all the European styles are to be found in the mouldings employed in them and in their ornamental decoration. In some of the earlier styles, such as the Assyrian and the Persian, there are no mouldings: coloured bands in brick, enamelled tiles or beton, were deemed sufficient to mark the divisions of their storeys or to decorate their buildings. The Egyptians employed two mouldings only, the cavetto (fig. 1), a deep moulding sometimes of great diameter, and their characteristic torus and decorative shrines, and the torus, a semicircular projecting moulding which was carried above the architrave and down the quoins of their buildings. The Greeks were the first to recognize, in their temples, the special value possessed by mouldings which, occupying an intermediate position between the ornamental sculptures and the simple architectural lines of the main structure, gave a richly decorative effect to the latter without interference with the beauty of the former.

The Classic mouldings may be divided into two classes, simple and compound; to the former belong the cavetto (of small dimensions when compared with the Egyptian cavetto) and the Scotia (fig. 2), employed for the bases of columns, which are seen below the eye, both concave mouldings, whilst the ovolo or echinus—Fr. ove or quart de rond—(figs. 3 and 4) and the torus are convex mouldings. The compound mouldings are those composed of curves of contrary flexure, such as the cyma recta or cyma (fig. 5), of which the upper part is concave and the lower convex, a moulding constantly employed for the upper member of the cornice, and the cyma-reversa or ogec (fig. 6)—Fr. talon—in which the upper portion is convex.

---

**Fig. 7.**

The Greeks sometimes varied the ogec moulding, the upper portion of which is turned back and the lower portion brought forward, and to this the term quirked ogec (fig. 7) is given. Another Greek moulding of compound form is the bird's beak (fig. 8), employed as a drip moulding above the corona. Of smaller dimensions is the astragal (fig. 9), a moulding invariably carved with the head and reel, which in Greek work is constantly used in conjunction with the enriched echinus and cyma-reversa mouldings (figs. 18, 20) and below the necking of Ionic capitals; and the listel or fillet, employed chiefly in the separation of curved mouldings one from the other; in the cymatium constituting its upper termination (fig. 5), and in the Scotia (fig. 2) its upper and lower border. In Classic work generally the cavetto is only employed for the apophyge under the capital and over the base, but in Roman work, as in the theatre of Marcellus, it sometimes took the place of the cymatium of the cornice. Although extremely simple in its form, the finest Greek moulding, and the one to which the Greeks apparently attached the greatest value, was the echinus under the abacus of the Doric capital. The earliest archaic example exists in the capital of the shafts flanking the tomb of Agamemnon at Mycenae (a, fig. 10), where it consisted of a large torus decorated with the chevron (see Capitals), and an apophyge carved with the petals of a flower; a similar decoration of the apophyge is found in two or three early Doric capitals, as at Paestum and Metapontum, but this is the only example known in which the echinus of the Doric capital was carved, though traces of painting and gilding have been found on them. Other examples showing the gradual development of the echinus are shown in fig. 10; b being from the temple at Corinth, c from the Parthenon at Athens, d from the portico at Delos, e an early Roman example (c 60 B.C.) of the temple at Cori, and f from the theatre of Marcellus, where it nearly approaches the quarter round always employed in late Roman work and in the Renaissance.

There is one other important decorative feature which forms the most characteristic feature of the bed mould of the Ionic cornice, viz. the dentil cornice (fig. 11), derived originally from the ends of the squared timbers which carried the cornice of the primitive Ionic temple, and in the earlier stone examples copied more or less literally; it subsequently in the 4th century was introduced as a part of the bed of the cornice of the Ionic Order, the temple of Minerva Polias at Priene in Asia Minor being one of the best examples. It consists of a series of projecting blocks with intervals between them equal to half
the width of the block. In the Greek Corinthian Order it was first introduced into the Choragic monument of Lysicrates. It was constantly employed by the Romans in their temples of the Ionic and Corinthian Orders, the finest example being in the bedmould of the temple of Castor in Rome, where it is twice the height of the other mouldings.

In the Romanesque style the mouldings consist almost entirely of rounds and hollows, the former known as the bowtel, and in England, France, Spain and Germany employed to decorate or soften the angle of an arch mould. As the Romanesque arch frequently consisted of two or more rings of arches, projecting one in front of the other, to which rings the term "order" is sometimes given, the repetition of this simple moulding constituted an ample decoration by itself, but in the Norman work in England and the north of France there is found the constant recurrence of mouldings broken into zigzag lines and other decorations coming under the head of ornamental mouldings described below. The simple bowtel (fig. 12) was retained in France far into the Gothic period, but in the Early English style the mouldings (fig. 13) became lighter, being more boldly cut than in the Romanesque styles. Here again, as in the earlier style, each ring or order is enriched with a succession of alternate rounds and hollows, the latter very deeply cut, and a few small fillets. The bowtel also is brought out to an angle which is sometimes emphasized by a small fillet; this is sometimes called the keel moulding from its resemblance in section to the bottom of a ship. Sometimes the angle of the ring is splayed, and the mouldings are worked on the splay, and this is very often found in the mouldings of the ribs of a vault (fig. 13a), giving greater lightness to the rib. The mouldings of the Decorated period (fig. 14) are more diversified than those of the Early English, and the hollows towards the end of the period become shallower and broader, ogees being frequently employed. One of the chief characteristics of the Perpendicular period (fig. 15) is the prevalence of large shallow hollows and the employment of two ogees in close contact with the convex sides next each other.

The French mouldings of the Gothic period in Normandy and adjacent parts follow very much on the same lines as those in England, but in the south of France and in Germany they are very much simpler, and one rarely finds the deep hollow which forms the chief characteristic of English mouldings. In French flamboyant and late German Gothic work the mouldings run through, penetrating one another; these in Germany were sometimes cut off, having the appearance of the smaller stems of a tree from which some of the boughs have been lopped.

Ornamental Mouldings.—Although the mouldings in Greek and Roman architectural works are in general form much the same, they vary materially in their profiles and also in the refinement of their enrichment with carving. It is probable that the earliest decoration of mouldings was confined to the painting only of their surfaces, and in one or two of the more archaic examples traces of painting only are found on them. The desire to accentuate the ornament would seem to have led the Greeks at a very early date to incise or raise in relief the decorative designs which originally were painted only; at first this was done very sparingly, and in the earlier buildings but few mouldings were employed; in course of time they increased in number, and in the Augustan period in Rome the carving extended to the flat surfaces of the corona, and the fascia and soffits of the architrave.

The four principal Classic mouldings, so far as their enrichment with carving is concerned, were the cyma-recta or cymatium; the cyma-reversa or ogee; the echinus or ovolo; and the torus. The cymatium was almost always decorated with a conventional treatment of the flower of the acanthus plant, known generally as the anthemion and sometimes as the honeysuckle; the finest example is that which is found in the cornice of the north doorway of the Erechtheum (fig. 16). Although in some cases the flower of the acanthus is repeated in the Roman cymatium, the rigidity of the other lines does not seem to have appealed to the Roman sculptor, who preferred more foliage, such as is shown in the cymatium of the Forum of Nerva (fig. 17), there being endless variety of design in Roman examples. The ogee-moulding in Greek work was always carved (fig. 18) with the Lesbian leaf (Fr. rais-de-cœur; Ger. Herzlaub), which in Roman work received a peculiar interpretation of the original design; not understanding the modelling of the leaf and requiring a deeper shadow, the Roman drilled holes in it and evolved another composition of two leaves, so that the outer edge of the Lesbian leaf formed a trefoil cusp (Fr. talon tréflé), constituting a new description of border, as shown in fig. 19, from the temple of Castor at Rome. The ovolo moulding, whether employed in the bedmould of a cornice, on the capital of an anta, or in the Ionic capital, was always carved (fig. 20) with the egg and dart enrichment (Fr. ove et dard; Ger. Eierstub), which was spread out wider by the Roman carver, while holes pierced on each side of the tongue changed its design into that of the egg and tongue (fig. 21). In both the enriched ogee and the carved ovolo the design was never complete without the bead and reel underneath (figs. 20 and 21), there being always two beads and four reels to each leaf or egg. When employed as the crowning moulding of an architrave, the ogee is always capped by a fillet; and the same applies to the cymatium of the cornice. When the ogee moulding was of small size and employed in a subordinate position, as is constantly done in Roman work, crowning the modillion...
or subdividing the fascia of the architrave, a simpler leaf pattern was employed.

Though not a moulding, the modillion, which was invented by the Romans to give additional support to the corona, forms part of the bedmould of the cornice, and may therefore be described here. It consists of a small bracket (fig. 22), the design of which was probably derived from the vertical console bracket which carried the corona of the Greek doorways, but which in the Roman cornice was employed horizontally. The design of the outer side is that of an Ionic volute with its cushion; on the inner side the volute is reversed and is of greater size, the sofit being masked by a leaf.

The torus moulding of the base in early examples was fluted but not carved, and the earliest example so treated is that found in the base of the columns of the Erechtheum, where it was enriched with the triple guilloche. In the temple of Apollo Branchidae, near Miletus in Asia Minor, where they would seem to have attempted to rival the figure decoration of the temple of Diana at Ephesus, the torus mouldings were elaborately carved with the acanthus plant and the laurel leaf; but it was in the Augustan age in Rome that the greatest elaboration was given to the torus of the base; in the Ara Pacis, set up in a.d. 13, it was carved with the double guilloche; the finest Roman example of an enriched torus being that of the base of the Trajan column in Rome, which is carved with laurel leaves tied at intervals with bands.

The principal enriched Byzantine moulding is that known as the Venetian dentil (fig. 23), in consequence of its constant employment in Venice and the towns in its vicinity. Its earliest appearance, however, is in Sta Sophia at Constantinople (a.d. 537). The other carved Byzantine mouldings are those which throughout Syria form richly carved string-courses, taking the place of the Classic cornice, and the hood moulds of arches. The Byzantine string-course, which is found in St Mark’s, Venice, and in most of the towns bordering on the Adriatic, is a cyma-recta carved with the acanthus leaf.

The enrichments of the mouldings of the Romanesque style are of great variety; in parts of Italy and in the south of France they were largely influenced by Byzantine work; but in Sicily, Apulia, Normandy and England the Normans introduced a series of purely geometrical forms in which the chief peculiarity is the rare occurrence of foliation. The most characteristic example is that of the zigzag or chevron (figs. 24, 25), of which there are many varieties; then follow the single and double billet (fig. 26), the double cube, the indented, the beakhead (fig. 27), &c. In the transition period in England, flowers and foliage begin to be introduced, and the rosette (fig. 28), the dog-tooth (fig. 29), which develops into a four-leaf flower, and the ball flower (fig. 30) follow, these being all carved in the hollow of cavetto mouldings. In the Decorated and Perpendicular styles, the flowers and foliage introduced in mouldings become more natural, till one reaches the Tudor rose (fig. 31), a precise copy of the flower, beyond which it was difficult to go.

In the 16th century the enrichment of mouldings passed through a transitional stage, being half Gothic and half Classic, and on the introduction of the purer Italian style Roman profiles and decoration were again employed. The Greek revival at the commencement, and the Gothic revival in the middle, of the 19th century naturally brought about a reaction in favour either of purer Classic forms or of Gothic work, but the vernacular types could not be displaced by the passing fashion, and the influence of Robert Adam is again paramount to-day.

MOULIN (Fr. moulin, a mill), in physical geography, the name given to the swirling cascades which are formed by glacier streams pouring into crevasses, and result in the formation of giant’s kettles.

MOULIN QUIGNON, a quary near Abbeville, France, celebrated for the discovery in 1863 by Boucher de Perthes of a human jaw-bone believed to be referable to the Quaternary period. By his collection of flints Boucher de Perthes had been the first to attempt to establish the existence of man in remote ages; but it had been objected that if the flints were indeed the work of man, human remains would have been found in association with them. Considerable excitement therefore was created both in England and France by the “find” of bones at Moulin Quignon, and a commission of inquiry was appointed. The report was favourable to the genuineness of the relic, but doubts have arisen as to whether they can be regarded as earlier than the Neolithic age.

MOULINS, a town of central France, capital of the department of Allier, 121 m. by rail N.W. of Lyons. Pop. (1906), 18,997. The town is situated on the right bank of the Allier, which is here crossed by a remarkable bridge of the 18th century about 1000 ft. in length. Moulines did not attain any importance till the 14th century, before which it consisted chiefly of some mills belonging to the dukes of Bourbon. The medieval town occupied a small area, the boundaries of which are marked on the N.E. and S. by the central boulevards occupying the site of the old moats. The modern town, expanding from this nucleus, is limited on the east and south by the railway, the southern portion being traversed by agreeable promenades. To the north is the spacious avenue known as the Cours de Bercy, close by the hospital and the lycée. The more interesting buildings lie within the old enceinte. The chief of these is the cathedral, which consists of a huge choir of the 15th and 16th centuries, and a nave in the early Gothic style but modern in construction and terminated by two towers with domes rising to a height of 512 ft. The church possesses a fine triptych attributed to Domenico Ghirlandajo (d. 1494), and fine windows of the 15th and 16th centuries. Among the oldest buildings in the town are the square tower of the 14th century (used as a prison) which is the chief relic of the château of the dukes of Bourbon, and a belfry of the 15th century. Part of an old Jesuit college serves as the court-house, which contains an archaeological museum. The library, which possesses a valuable Bible of 1115, is part of the hôtel-de-ville. Numerous mansions of the 15th and 16th centuries border the streets of the
old quarter of the town. There is a statue of the poet Théodore de Banville, born at Moulins in 1823. The town is the seat of a prefect, a bishop, and a court of assizes, and has tribunals of first instance and commerce, and a branch of the Bank of France. Yzerve, t½ m. E. of Moulins, has an interesting Romanesque church (12th century); 7½ m. W.S.W. of Moulins is Souvigny, formerly famous for its Cluniac priory. Its church, a fine building of the 11th and 12th centuries, retains in its 15th century additions the splendid tombs of Louis II. and Charles I., dukes of Bourbon in the 15th century, and other tombs of the Bourbon family, now in ruins.

Moulins became the residence of the dukes of Bourbon about the middle of the 14th century, and capital of the duchy towards the end of the 15th century. In 1536, under Charles IX., an important assembly of notables was held in the town, at which the judicial system of France was reorganized.

MOULMEIN (or MAULMEIN), the port and headquarters of Ambly district and Tenasserim division of Burma. The population in 1891 was 58,446, and the increase in the last quarter of a century has been very slight. Ship-building, which formerly was an important industry, has now been given up, but there is still a considerable export of tea and rice, and there are several steam rice-and-saw-mills. The total exports average more than a million sterling. Three steamers run weekly to Rangoon. Germany and Siam are represented by consuls; Persia, Denmark, and Norway and Sweden by vice-consuls; and Italy and the United States of America by consular agents. The garrison of Madras native infantry, formerly stationed in the town, was withdrawn in 1860. The town, which has the appearance of being on a river, the Salween, is really on the sea, with the island of Bilugyun in front. It is one of the most picturesque ports in the East. There is a branch of the Bank of Bengal, and two newspapers are published—one in English and one in Burmese.

MOULT, a term for the shedding of feathers at the periodic renewal of the plumage by birds, and so transferred to the periodic shedding of the old skin, shell, &c., by other animals. The word is seen in O. Eng. in the verb blimation, to exchange; cf. mod. Ger. mausen, mausern; the earlier forms in English are mout, mute; the insertion of the i, as in "fault," dates from the 16th century.

MOULTON, LOUISE CHANDLER (1835-1908), American poet, story-writer and critic, daughter of Lucius L. Chandler, was born in Pomfret, Connecticut, in 1835. In 1855 she married a Boston publisher, William U. Moulton (d. 1898), under whose auspices her earliest literary work had appeared in The True Flag. Her first volume of collected verse and prose, This, That and the Other (1854), was followed by a story, Auto Clifford (1855), and by My Book (1856); her literary output was then increased, and until 1873 when she resumed activity with Bed-time Stories, the first of a series of volumes, including Firelight Stories (1858) and Stories told at Twilight (1890). Meanwhile she had taken an important place in American literary society, writing regular critiques for the New York Tribune from 1870 to 1876 and a weekly literary letter for the Sunday issue of the Boston Herald from 1888 to 1892. In 1876 she published a volume of notable Poems (renamed Swallow-flights in the English edition of 1877) and visited Europe, where she began close and lasting friendships with leading men and women. Thenceforward she spent the summers in London and the rest of the year in Boston, where her salon was one of the principal resorts of literary talent. In 1880 another volume of verse, In the Garden of Dreams, confirmed her reputation as a poet. She also wrote several volumes of prose fiction, including Miss Eyre from Boston and Other Stories, and some descriptions of travel, including Lazy Tours in Spain (1896). She was well known for the extent of her literary influence, the result of a sympathetic personality combined with fine critical taste. She died in Boston on the 10th of August 1908. See Lilian Whiting, Louise Chandler Moulton (Boston, 1910).

MOULTRIE, JOHN (1790-1874), English poet, was born in London on the 30th of December 1790. He was educated at Eton, and many of his best verses were contributed to the Etonian. He entered Trinity College, Cambridge, in 1819, and in 1822 began to reside at the Middle Temple. Three years later he was ordained, and was presented to the living of Rugby by Lord Craven. At Rugby he became intimate with Thomas Arnold, to whom two of his best sonnets are addressed. He died at Rugby on the 26th of December 1874. He published several volumes of verse during his lifetime, and a complete edition of his poetry was published (2 vols., 1876) with a memoir by Derwent Coleridge. They include, amongst much that is dull, some popular pieces, "Godiva," "Three Minstrels," an account of meetings with Wordsworth, Coleridge and Tennyson, "My Brother's Grave," and some excellent hymns.

MOULTRIE, WILLIAM (1730-1805), American soldier, was born in Charleston, South Carolina, on the 23rd of November 1730. His father, a physician, and a graduate of the University of Edinburgh, migrated to Charleston before 1720. The son was educated the Common House of the Assembly in 1754, 1760 and 1772; and in 1756 he was captain of a provincial regiment in the expedition under Governor William H. Lyttelton against the Cherokees. Although he was connected by many ties to the British, he espoused the American cause on the outbreak of the War of Independence, and was a member of the first provincial congress (1773) of South Carolina, which in June made him a colonel of the Second South Carolina regiment; and he was a member of the second provincial congress (1775-1776). On Fort Johnson, on James Island in Charleston harbour, he raised what is said to have been the first American battle-flag—blue, with a white crescent in the dexter corner, inscribed with the word "Liberty"; the flag was devised by him in September 1775. In March 1776 he took command of a palmetto fort which he had built on Sullivan's Island, off Charleston, which he held against the attack of Admiral Sir Peter Parker on the 28th of June, and which soon after the battle was renamed Fort Moultrie by the General Assembly. He was thanked by Congress, was made a brigadier-general in the continental army in September 1776, and was placed in command of the department of Georgia and South Carolina. He disbanded the British garrison at Beaufort, South Carolina, in February 1779, and in April made it possible for the city of Charleston to put itself into a state of defence by delaying the advance of General Augustine Prevost. He was one of those who advised against the surrender of Charleston, where he commanded the garrison until the arrival of General Benjamin Lincoln. His imprisonment after the surrender of Charleston (May 1780) lasted until his exchange with others for General Burgoyne in February 1782. In October 1782 he was made a major-general. He was governor of South Carolina 1782-1787, and in 1787-1794. He died in Charleston on the 27th of September 1805.

He wrote Memoirs of the Revolution so far as it Related to the States of North and South Carolina (2 vols., 1802).

MOUND, now used in the sense of a pile or heap of earth, artificial or natural, especially such a pile raised over a grave or burial-place, a tumulus, or as a means of defence, and so used to translate Lat. agger. The earliest use in English is for a hedge or other boundary between adjoining lands; this only survives dialectically. The word is obscure in origin, but was early confused with in "maunt," i.e. hill; Lat. mons, mons. A connexion with O. Eng. mound, guardianship, hand, has been suggested. The "orb," i.e. a globe of gold surmounted by a cross, as forming part of the regalia (q.v.), is often known as a "mound"; this is a translation of Fr. monde; Lat. mundus, world.

MOUND-BUILDERS, in North America, the name given to the prehistoric inhabitants who chiefly centred in the valleys of the Mississippi and Ohio, and who seem to have possessed a measure of civilization far in excess of that of the North American Indians when first met by the whites. The remarkable mounds, which have given occasion for the name, are fortified enclosures and tumuli of the most varied appearance, round, conical, or in the shape of animals. They are scattered
over an immense tract of country from the great lakes to the Gulf of Mexico, and from the Rockies to the Atlantic, but are specially frequent in the valley of the Mississippi, along its left tributaries, in Arkansas, Kansas and the basin of the Ohio. But the old theory that the mound-builders were a distinct race of highly civilized agriculturists, who had lived from remote antiquity in the most regions of the mounds and were eventually exterminated by the nomadic hordes coming from the northward, represented to-day by the present Indians, is no longer supported by the principal American ethnologists, who hold that the Indians are their descendants.

In Ohio there are thousands of mounds, some in the form of circles, others four-sided, and in a few cases eight-sided. Sometimes a square and a circle are united. Altar-mounds, small rounded heaps of earth, are found in Ohio. At their centre is a basin-shaped mass of hard clay showing effects of fire. These basins are 3 or 4 ft. across, and contain ashes and charcoal. Upon these altars are found many objects.

The most famous mound in Ohio is the “Great-Serpent,” in Adams county. It lies upon a narrow ridge between three streams which unite. It is a gigantic serpent made in earth. Across the widely-opened jaws it measures 75 ft.; the body just behind the head measures 30 ft. across and is 5 ft. high, and, following the curves, the length is 1348 ft. The tail is in a triple coil. In front of the monster is an elliptical enclosure with a heap of stones at its centre. Beyond this is a form; somewhat indistinct, thought by some to be a face. Among the most interesting mounds are the effigy mounds—earthen forms of mammals, birds and reptiles—usually in groups and of gigantic size. Among them are buffalo, moose, elk, deer, fox, wolf, panther and lynx. Some panthers have tails 350 ft. long, and some eagles measure 1000 ft. from tip to tip of outspread wings. Occasionally the figures are cut or sunk in the earth, and near them are hundreds of simple burial mounds. It seems most probable that the purpose of these effigy mounds are totemic, and that they were objects of worship as guardians of the villages.

Further south in west Tennessee another class of mound is found. This contains graves made of slabs of stone set on edge. The simplest have six stones, two at the sides, two at the ends, one at the top and one at the bottom. Sometimes there is one of these graves in a mound, sometimes many. In one, 12 m. from Nashville, 45 ft. across and 12 ft. high, were found a hundred skeletons, mostly in stone graves ranged one above the other. The skeletons in the upper graves had been buried stretched at full length. The lower graves were short and square, and the bones in them had been cleaned and piled in little groups.

The mound-builders were Stone-Age men, and made many beautiful objects of stone, shell, bone and beaten metals, but they had no knowledge of smelting. That they were not one race is proved by a study of the skulls from the mounds.

**MOUNDSVILLE, a city and the county-seat of Marshall county, West Virginia, U.S.A., on the Ohio river, 12 m. S. of Wheeling. Pop. (1900) 5632; (1910) 8018. It is served by the Baltimore & Ohio railroad, by an electric line to Wheeling, and by boats to Pittsburg, Cincinnati and intermediate ports. Near Moundsville, at the mouth of Grave Creek, is Grave Creek Mound, one of the largest relics of the “American mound-builders”; it is in the form of a regular cone, and is about 320 ft. in diameter at the base and 70 ft. in height. Two sepulchral chambers were discovered in it in 1838. In the upper chamber, about half-way back from the centre of the base and the apex, was a single skeleton, adorned with beads, copper bracelets and plates of mica; in the lower chamber, directly under the upper and partly in the natural earth, were two skeletons, one adorned with beads and the other without ornament. On the sides and top of the lower chamber was a framework of timbers, which seems to indicate that the mound is of comparatively recent date. The city of Moundsville was formed in 1866 by the consolidation of the town of Moundsville (laid out on the Ohio river in 1831, and incorporated in 1832), and the town of Elizabeth (laid out, about 4 m. from the river, in 1798, and incorporated in 1839).

**MOUNTET-SULLY, JEAN (1841-), French actor, was born at Bergerac, on the 28th of February, 1841. He entered the Conservatoire at the age of twenty-one, and took the first prize for tragedy. In 1868 he made his début at the Odéon without attracting much attention. His career was interrupted by the Franco-Prussian War, and the liking he developed for soldiering had almost decided him to give up the stage, when he was offered the opportunity of playing the part of Oreste in Racine’s Andromaque at the Comédie Française in 1872. His striking presence and voice and the passionate vigour of his acting made an immediate impression, and the eventual result was his election as sociétaire in 1874. He became one of the mainstays of the Comédie Française, and distinguished himself in a great variety of tragic and romantic parts. Perhaps his most famous impersonation was that of Oedipus in L’Oedipe roi, a French version by Jules Lacroix of Sophocles’s drama. This was first performed in the old Roman amphitheatre at Orange in 1888. Other prominent parts in Mounet-Sully’s répertoire were an admirable company in a French translation of Iphigenie en Aulide, Hippolyte in Phèdre, Hamlet, the title part in Victor Hugo’s Hernani, and Ray Bias, Francis I. in Le Roi s’amuse, and Didier in Marion Delorme. He was created chevalier of the Legion of Honour in 1889. He also wrote a play, La Busee de larmes, and in 1906, in collaboration with Pierre Barbièr, La Vieillesse de Don Juan in verse.

**MOUNIER, JEAN JOSEPH (1758-1806), French politician, was born at Grenoble (Isère) on the 12th of November 1758. He studied law, and in 1783 obtained a judgeship at Grenoble. He took part in the struggle between the parlements and the court. In 1788, and promoted the meeting of the estates of Dauphiné at Vizille (July 20, 1788), which on the eve of the Revolution created an immense stir. He was secretary of this assembly, and drafted the cahiers of grievances and remonstrances presented by it to the king. Thus brought into prominence, Mounier was unanimously elected deputy of the third estate to the states general of 1789. There, and in the Constituent Assembly, he was at first an upholder of the new ideas, pronouncing himself in favour of the union of the Third Estate with the two privileged orders, proposing the famous “Français demain s’égare.” He took a great part in the preparation of the new constitution, and demanding the return of Necker. On the 28th of September 1789 he was elected president of the Constituent Assembly. Being unable, however, to approve the proceedings which followed, Mounier withdrew to Dauphiné, gave in his resignation as deputy, and, becoming suspect, took refuge in Switzerland in 1790. He returned to France in 1801, was named by Bonaparte prefect of the department of Ille-et-Vilaine, which he reorganized, and in 1805 was appointed councillor of state. He died in Paris on the 28th of January 1806. His principal writings are: Considerations sur les travaux des parlements (1780); Recherches sur les causes qui ont empêché les Français de devenir libres (1793), and De l’influence attribuée aux philosophes, aux francs-maçons et aux illuminés sur la révolution (1795).

**MOUNT, WILLIAM SIDNEY (1807-1863), American artist, was born at Setauket, Long Island, New York, on the 26th of November 1807. He studied in the schools of the National Academy of Design, New York, and in 1832 was made a full Academician. Among his better-known works are “Turning

**MOUNTAIN** (O. Fr. montaigne; popular Lat. montanea, an adjectival form from the classical mens, montis, whence Eng. "mount," a form usually used along with the name of an individual mountain, e.g. Mt. Everest), a natural elevation of the earth's surface. The term properly connotes height superior to that of a hill (O. Eng. hylf, cognate with Lat. collis); but the distinction depends on the prominence of a given elevation in relation to its surroundings, and in some degree to the bold or gentle character of its outline.

For the classification of mountains according to the various processes of their formation, see Geography, § Principles of Geography; and for further details Geology, § viii.

**MOUNTAIN, THE** (La Montagne), the name applied during the French Revolution to a political group, whose members, called Montagnards, were on the left of the Revolution, and the enemies of the Girondists. The term, which was first used during the session of the Legislative Assembly, did not come into general use until 1793. At the opening of the Convention the Montagnard group comprised men of very diverse shades of opinion, and such cohesion as it subsequently acquired was due rather to the opposition of its leaders to the Girondist leaders than to any fundamental hostility between the two groups. The chief point of distinction was that the Girondists were mainly theorists and thinkers, whereas the Mountain was composed almost entirely of uncompromising men of action. During their struggles with the Girondists, the Montagnards gained the upper hand in the Jacobin Club, and for a time Jacobin and Montagnard were synonymous terms. The Mountain was successively under the sway of such men as Marat, Danton, and Robespierre, and the group finally disappeared after Robespierre's death and the successes of the French arms.

See also the articles Jacobins, Girondists and French Revolution.

**MOUNTAIN ASH**, an urban district of Glamorganshire, south Wales, in the Aberdare valley on the Cynon, a west bank tributary of the Taff, with several stations on the Taff Vale and Great Western railways, 18 m. N.E. of Cardiff. Pop. (1901), 31,093. A branch of the Glamorganshire canal passes through the place. At the beginning of the 19th century Mountain Ash was a small village known only by its Welsh name of Aberperen, but from 1850, with the development of its collieries, the population rapidly increased. The district has an area of 10,504 acres and comprises; besides Mountain Ash proper, a string of villages, the chief being Cwmpennau, Penrhwiweir, Abercyon or Aberdare Junction (at the confluence of the Cynon with the Taff) and Ynysybwolf, 3 m. to the west on the Clydach. The public buildings include St Margaret's (1862) and St Winifred's (1883), the parish churches of Mountain Ash and Penrhwiweir respectively; old and new town halls (1864 and 1904), cottage hospital (1806), and a library institute and public hall erected in 1899, at a cost of £8000, by the workmen of Nixon's Navigation collieries. There is a park of 7 acres given in 1897, by Lord Aberdare, whose residence, Duffryn, is in the district. There are also a workmen's institute and a public hall at Penrhwiweir. The older part of the urban district is included in the parliamentary borough of Merthyr Tydfil, and also shares with Merthyr and Aberdare the services of a stipendiary magistrate.

**MOUNTAINEERING**, the art of moving about safely in mountain regions, avoiding the dangers incident to them, and attaining high points difficult of access. It consists of two main divisions, rock-craft and snow-craft. Rock-craft consists in the intelligent selection of a line of route and in gymnastic skill to follow the line chosen. In snow-craft the choice of route is the result of a full understanding of the behaviour of snow under a multitude of varying conditions; it depends largely upon experience, and much less upon gymnastic skill. The dangers which the craft of climbing has been developed to avoid are of two main kinds: the danger of things falling on the traveller and the danger of his falling himself. The things that may fall are rocks, ice and snow; the traveller may fall from rocks, ice or snow, or into crevasses in ice or snow. There are also dangers from weather. Thus in all there are eight chief dangers: falling rocks, falling ice, snow-avalanches, falls from difficult rocks, falls from ice slopes, falls down snow slopes, falls into crevasses, dangers from weather. To select and follow a route avoiding these dangers is to exercise the climber's craft.

**Falling Rocks.**—Every rock mountain is falling to pieces, the process being specially rapid above the snow-line. Rock-faces are constantly swept by falling stones, which it is generally possible to dodge. Falling rocks tend to form furrows in a mountain face, and these furrows (couloirs) have to be ascended with caution, their sides being often safe when the middle is stone-swept. Stones fall more frequently on some days than on others, according to the recent weather. Local experience is a valuable help on such a question. The direction of the dip of rocks should be observed, as such a particular face is safe or dangerous; the character of the mountain must also be considered. Where stones fall frequently débris will be found below, whilst on snow slopes falling stones cut furrows visible from a great distance. In planning an ascent of a new peak such traces must be looked for. When falling stones get mixed in considerable quantity with slushy snow or water a mud avalanche is formed (common in the Himalaya). It is necessary to avoid camping in their possible line of fall.

**Falling Ice.**—The places where ice may fall can always be detected. The roof of the gallery, for instance, or the ice which is firmly fixed from a nub of rock, are danger spots. It falls in the broken parts of glaciers (seracs) and from overhanging cornices formed on the sides or fronts of narrow ridges. Large icicles are often formed on steep rock-faces, and these fall frequently in fine weather following cold and stormy days. They have to be avoided like falling stones. Seracs are slow in formation, and slow in arriving (by glacier motion) at a condition of unstable equilibrium. They generally fall in or just after the hottest part of the day, and their débris seldom goes far. A skilful and experienced ice-man will usually devise a safe route through a most intricate ice-fall, but such a place should be avoided in the afternoon of a hot day. Hanging glaciers (i.e. glaciers perched on steep slopes) often discharge themselves over steep rock-faces, the snout breaking off at intervals. They can always be detected by their débris below. Their track should be avoided.

**Snow Avalanches.**—These mainly occur on steep slopes when the snow is in bad condition, early in the year, or after a recent fresh fall. Days when snow is in bad condition are easily recognized; on such days it may be inadvisable to traverse snow-slopes which at another time may be as safe as a high-road. Beds of snow collected on rock-ledges in bad weather fall off when a thaw comes, and are dangerous to rock-climbers. Snow that has recently fallen upon ice slopes is always liable to slip off bodily. Such falling masses generally make the lower part of their descent by couloirs. Snow avalanches never fall in unexpected places, but have their easily recognizable routes, which can be avoided in times of danger by experienced mountaineers.

**Falls from Rocks.**—The skill of a rock-climber is shown by his choice of handhold and foothold, and his adhesion to those he has chosen. Much depends on a correct estimate of the firmness of the rock where weight is to be thrown upon it. Many loose rocks are quite firm enough to bear a man's weight, but experience is needed to know which can be trusted, and skill is required in transferring the weight to them without jerking. On all difficult rocks the rope is the greatest safeguard for all except the first man in the ascent, the last in the descent. In such places a party of three or four men roped together, with a distance of 15 to 20 ft. between one and another, will be
able to hold up one of their number (except the top man) if one only moves at a time and the others are firmly placed and keep the rope tight between them, so that a falling individual may be arrested before his velocity has been accelerated. In very difficult places help may be obtained by throwing a loose rope round the body, or horizontal track and pulling on it; this method is specially valuable in a difficult descent. The rope usually employed is a strong Manila cord called Alpine Club rope, but some prefer a thinner rope used double. On rotten rocks the rope must be handled with special care, lest it should start loose stones on to the heads of those below. Similar care must be given to handholds and footholds, for the same reason. When a horizontal traverse has to be made across very difficult rocks, a dangerous situation may arise unless at both ends of the traverse there be firm positions. Even then the end men gain little from the rope. An assistant on hard rocks in the usual manner of forms: two, or even three, men climbing on one another's shoulders, or using for foothold an ice-axe propped up by others. The great principle is that of co-operation, all the members of the party climbing with reference to the others, and not as independent units; each when moving must know what the man in front and the man behind are doing. After bad weather steep rocks are often found covered with a veneer of ice (verglas), which may even render them inaccessible. Climbing-irons (crampons, stigeisen) are useful on such occasions.

**Ice Slopes.**—Climbing-irons are also most useful on ice or hard snow, as by them step-cutting can sometimes be avoided, and the footing at all times rendered more secure. True ice slopes are rare in Europe, though common in tropical mountains, where newly-fallen snow quickly thaws on the surface and becomes sodden below, so that the next night's frost turns the whole into a mass of solid ice. An ice slope can only be surmounted by step-cutting. For this an ice-axe is needed, the common form being a small pick-axe on the end of a pole as long as from the elbow of a man to the ground. This pole is used also as a walking-stick, and is furnished with a spike at the foot.

**Snow Slopes** are very common, and usually easy to ascend. At the foot of a snow or ice slope is generally a big crevasse, called a bergschrund, where the final slope of the mountain rises from a snow-field or glacier. Such bergschrunds are generally too wide to be strided, and must be crossed by a snow bridge, which needs careful testing and a painstaking use of the rope. A steep snow slope in bad condition may be dangerous, as the whole body of snow may start as an avalanche. Such slopes are less dangerous if ascended directly than obliquely, for an avalanche is more probable, say 1888, and facilitates the movement of the mass. New snow lying on ice is specially dangerous. Experience is needful for deciding on the advisability of advancing over snow in doubtful condition. Snow on rocks is usually rotten unless it be thick; snow on snow is likely to be sound. A day or two of fine weather will usually bring new snow into sound condition. Snow cannot lie at a very steep angle, though it often deceives the eye as to its slope. Snow slopes seldom exceed 45°. Ice slopes may be much steeper. Snow slopes in early morning are usually firm and safe, but in the afternoon are quite soft and possibly dangerous; hence the advantage of starting early.

**Crevasses.**—These are the slits or deep chasms formed in the substance of a glacier as it passes over an uneven bed. They may be open or hidden. In the lower part of a glacier the crevasses are open. Above the snow-line they are frequently hidden by arched-over accumulations of winter snow. The detection of hidden crevasses requires care and experience. After a fresh fall of snow they can only be detected by sounding with the pole of the ice-axe, or by looking to right and left where the open extension of a partially hidden crevasse may be obvious. The safeguard against accident is the rope, and no one should ever cross a snow-covered glacier unless roped to one, or better to two, companions.

**Weather.**—The main group of dangers caused by bad weather centre round the change it effects in the condition of snow and rock, making ascents suddenly perilous which before were easy, and so altering the aspect of things as to make it hard to find the way or retrace a route. In storm the man who is wont to rely on a compass has great advantage over a merely empirical follower of his eyes. In large snow-fields it is, of course, easier to go wrong than right. Trained intelligence is the best companion and the surest guide.

**History.**—The first recorded mountain ascent after Old Testament times is Trajan's ascent of Etna to see the sun rise. The Roche Melon (11,600 ft.) was climbed in 1538. Peter III. of Aragon climbed Canigou in the Pyrenees in the last quarter of the 13th century. In 1339 Petrarch climbed Mt Ventou near Vaucise. In 1492 the ascent of Mt Aiguille was made by order of Charles VIII. of France. The Humanists of the 16th century adopted a new attitude towards mountains, but the disturbed state of Europe nipped in the bud any attempt at mountaineering of the Zürich school. Leonardo da Vinci climbed to a snow-field in the neighbourhood of the Val Sesia and made scientific observations. Konrad Gesner and Josias Simler of Zürich visited and described mountains, and made regular ascents. The use of axe and rope were locally invented at this time. No mountain expeditions of note are recorded in the 17th century. In 1744 the Titlis was climbed—the first true snow-mountain. Pococke and Windham's historic visit to Chamonix was made in 1741, and set the fashion of visiting the Alps. When the Rev. W. S. Green made an expedition in 1775 by a party of natives. In 1786 Dr Michel Paccard and Jacques Balmat gained the summit for the first time. De Saussure followed next year. The Jungfrau was climbed in 1811, the Finsteraarhorn in 1812, and the Zermatt Breithorn in 1813. Thenceforward tourists showed a tendency to climb, and the body of Alpine guides began to come into existence in consequence. Systematic mountaineering, as a sport, is usually dated from Sir Alfred Wills's ascent of the Wetterhorn in 1834. The first ascent of Monte Rosa was made in 1855. The Alpine Club was founded in London in 1857, and soon initiated in most European countries. Edward Whymper's ascent of the Matterhorn in 1865 marks the close of the main period of Alpine conquest, during which the craft of climbing was invented and perfected, the body of professional guides formed and their traditions fixed. Passing to other ranges, the exploration of the Pyrenees was concurrent with that of the Alps. The Caucasus followed, mainly owing to the initiative of D. W. Freshfield; it was first visited by exploring climbers in 1868, and most of its great peaks were climbed by 1888. Trained climbers turned their attention to the mountains of North America. During 1885, while the Rev. S. Green made an expedition to the Selkirks. From that time exploration has gone on apace, and many English and American climbing parties have surveyed most of the highest groups of snow-peaks; Pike's Peak (14,147 ft.) having been climbed by Mr E. James and party in 1886, and Mt Saint Elias (18,024 ft.) by the duke of the Abruzzi and party in 1897. The exploration of the highest Andes was begun in 1879-1880, when Whymper climbed Chimborazo and explored the mountains of Ecuador. The Cordillera between Chile and Argentina was attacked by Dr Gusself in 1883, and again (1886, 1887) by Dr E. E. Mountaineering expedition in 1887. The Andes of Bolivia were explored by Sir Martin Conway in 1898. Chilean and Argentine expeditions revealed the structure of the southern Cordillera in the years 1885-1898. Sir Martin Conway visited the mountains of Tierra del Fuego in 1898. The Alps of New Zealand were first attacked in 1882 by the Rev. W. S. Green, and shortly afterwards a New Zealand Alpine Club was founded, and by their activities the exploration of the range was pushed forward. In 1895 Dr E. E. Mountaineering expedition in 1895. The first attempt to climb was made in 1889 by Of the high African peaks, Kilimanjaro was climbed in 1889 by Dr Hans Meyer, Mt Kenya in 1886 by J. E. S. Mackinder, and a peak of Ruwenzori by H. J. Moore in 1900. The Asiatic mountains have as yet been little climbed, though those that lie within the British Empire have been surveyed. In 1892 Sir Martin
Conway explored the Karakoram Himalayas, and climbed a peak of 23,000 ft. In 1805 A. F. Mummery made a fatal attempt to ascend Nanga Parbat, whilst in 1809 D. W. Freshfield took an expedition to the snowy regions of Sikkim. In 1809, 1893, 1896 and 1898 Mrs Fannie Bullock Workman made ascents in the Himalayas, including one of the Nun Kun peaks (23,000 ft.). A body of Gurkha sepoys were trained as expert mountaineers by Major the Hon. C. G. Bruce, and a good deal of exploration has been accomplished by them. The only mountains of the northern polar region that have been explored are those of Spitzbergen by Sir Martin Conway's expeditions in 1806 and 1807. Conway was in the north of Canada and the Lofotenas by various Alpine Club and Northern parties. (W. M. C.)

### MOUNT BARKER—MOUNTED INFANTRY

Mount Desert was discovered and named by Samuel de Champlain on the 5th of September 1604. French Jesuits established a settlement, St Sauveur, at the entrance to Somes Sound in 1605, but this was destroyed four years later by Samuel Argall. In 1688 the island was granted by Louis XIV. to Sieur de la Motte Cadillac, but no permanent settlement was established until 1744, when the general court of Massachusetts granted one-half of the island to Governor Francis Bernard and under his encouragement a settlement was begun at Southwest Harbor. During the War of Independence all the American estates of Bernard were confiscated, but in 1785 his former interest in Mount Desert was conveyed to his son, John, and two years later heirs of Cadillac, among them his granddaughter, Mme de Greigoire, who had come to Maine in 1786, received from the general court a grant for the remaining portion. Until the summer visitors came, the settlers gained only a scanty livelihood, chiefly by fishing, lumbering, boat building and farming. Practically all of them lived along the shore; they had boats, but few horses, and the roads were only rough trails. There is no record of any mail service until 1820, and as late as 1870 the only means of reaching the island was by stage from Bangor or by steamboat twice a week from Portland.

See George E. Street, Mount Desert, a History (Boston, 1905).

**MOUNTEBANK** (ital. montambanco, montimbauso, from mon- tare, to climb up on, mount, and banco, bench, cf. saltimbanco, an acrobat or dancer, one who dances or leaps on a bench), a wandering juggler, story-teller, seller of quack medicines, &c., who performs his entertainment on a platform or raised bench, hence any charlatan or quack.

**MOUNTED INFANTRY,** infantry soldiers who ride instead of marching on foot from one place to another. As combatants they are infantry pure and simple, being neither armed nor trained to fight on horseback, and their special characteristic is the power to move from one point to another with great rapidity. They are therefore useful (a) in wars, such as colonial wars, in which cavalry proper finds no scope for its activity, and (b) in performing duties for which mounted troops, but not necessarily troops that can fight mounted, are required. In these two roles mounted infantry is obviously a substitute for cavalry. As cavalry is both a most expensive arm and one which cannot be improvised, there is an ever-recurring tendency in all armies to consider it as being more ornamental than useful, and in consequence to substitute mounted infantry under one name or another (the original dragons for example were mounted infantry) for "shock action" cavalry. In recent times, owing to the development of the long-ranging magazine rifle, this tendency has been intensified to such a degree that in Russia, for example, converted the whole of her cavalry into dragons—the term being used in its old sense—and trained it to act dismounted in large bodies. It is however significant of the failure of this wholesale conversion that after the Russo-Japanese War the regiments that were formerly hussars and lancers were reorganized as such and ceased to be styled and trained as dragons.

It is difficult, but at the same time important, to differentiate between dragons or "mounted rifles," as they are often called to-day, and mounted infantry in a narrower sense of the word.
Mounted rifles are half cavalry, mounted infantry merely specially mobile infantry. The American cavalry in the Civil War, the Boers in the South African War, the Russians in the Manchurian campaign, were mounted rifles, and the question of their advantages and disadvantages, as compared with what is generally called "regular" cavalry, is purely a cavalry one. The main question as regards mounted infantry is whether its existence as a special arm is justified by the kind and degree of assistance which it is peculiarly qualified to give to the other arms in war. If this be answered in the affirmative for a particular army, then that army, having raised mounted infantry, may require of it such additional services as it would be more convenient to demand from regular cavalry. Mounted infantry in this case may and in fact does assume the rôle of mounted rifles; for example, in the British regular army the duties of divisional mounted troops are performed by mounted infantry, while in the territorial army the same duties are performed by yeomanry mounted rifles.

In the British mounted infantry, which is the only force in any army specially trained as such, the course of instruction lasts four months and is based on the assumption that officers and men under instruction are already fully trained as infantry (GAMBIER). The battalions are composed of three such companies and a machine-gun section. Mounted infantry battalions and companies do not exist in peace, but are formed on mobilization from the qualified men available who can be spared from the infantry. Since many more men are trained than would be required for the 24 or 36 companies forming part of it, whilst the arm is capable of considerable expansion, while the men first selected for the service are in every way picked men. As already mentioned its duties are (a) with respect to the cavalry, first to assist and secondly to supplement or replace it—by the judicious use of the rifle, and (b) with respect to the infantry to relieve the unmounted man as far as possible of reconnoitring and orderly duties, and above all of the necessity of hurried and exhausting movements to seize points of support.

**Cyclists.**—The application of the bicycle to military purposes was first suggested in Great Britain, and military cycling became the special and almost exclusive property of the volunteer force, in which, when cycling became universally popular and the machines cheap, practically all battalions had sections and most of them companies of cyclists. In those days, however, the want of a common organization separated the yeomanry from the volunteers, and the latter, possessing no mounted troops of its own, employed its numerous cyclists in reconnoitring, protective and orderly work indifferently. Provisional battalions were frequently formed, and in spite of their heterogeneous composition and inadequate staff they proved capable of manoeuvring as units. Movements in brigade were practised at Aldershot in 1901, the brigade composed of 3 battalions of about 650 rifles each, drawn from some forty volunteer infantry units under training at the time, being trained in combined movements by parallel roads and night marching, as well as in field operations. When the fusion of the yeomanry and volunteers in the territorial force (1907-1908) released cyclists from the duties of mounted troops which had hitherto been imposed on them, the cyclist companies in the infantry battalions were disbanded, and their place taken by 10 cyclist battalions specially trained for protective work in large tactical bodies. The regular army, which is generally employed in almost roadless countries, only maintains a few cyclists for orderly work.

Amongst the regular armies that of France was certainly the pioneer in the matter of cycling. Infantry support for cavalry is a fundamental principle of the French doctrine of tactics, and this infantry support in so well-roaded a country as France naturally takes the form of strong cyclist groups. The French military cyclists are equipped with a folding bicycle, which allows of cross-country movement being undertaken without leaving the bicycles unguarded. In Germany very few military cyclists are maintained—one small section in each infantry or cavalry regiment. The field service regulations permit the grouping of these sections for united action as a company, but only under special circumstances. In Italy, for instance, whole battalions of the fast-moving light troops, Bersaglieri, have been within recent years provided with the cycle.

Cyclists are mounted infantry in the strictest possible sense of the phrase. They possess over all horsemen the incalculable advantages of being able to make longer marches; for they can cover 80 or 90 m. a day for several days; of exemption from forage anxieties; of freedom from the necessity in action of leaving one-third or one-quarter of the men to hold the horses; and of actual speed, an ordinary cyclist being able to move faster along a straight road than a strong marching column. On the other hand cyclist troops can never be as free to move across country as horsemen; a cyclist column, owing to its speed and great length in proportion to its numbers, is peculiarly liable to surprise; and the condition of the roads or a strong head wind materially reduces its rate of marching.

**MOUNTFORT, WILLIAM** (c. 1664-1692), English actor and dramatic writer, was the son of a Staffordshire gentleman. His first stage appearance was with the Dorset Garden company about 1678, and by 1682 he was taking important parts, usually those of the fine gentleman. Mountfort wrote a number of plays, wholly or in part, and many prologues and epilogues. He married, in 1686, Susanna Percival (see VERBRUGGEN, MRS), the actress. Owing to jealousy of Mrs Bracegirdle's supposed interest in Mountfort, Captain Richard Hill, an adventurer, who had annoyed her with persistent attentions, accompanied by Charles, fifth Baron Mohun, murdered Mountfort in Howard Street, Strand, on the 9th of December 1692. Hill made his escape. Lord Mohun was tried by his peers and acquitted by a vote of 69 to 14.

**MOUNT GAMBIER,** a town of Grey county, South Australia, 305 m. S.E. of Adelaide. It stands on the northern base of the mountain of the same name, an extinct volcano. It is a handsome town with many fine buildings of white limestone and grey and red dolomite, which abound in the neighbourhood, the church of St Paul being the finest edifice of its kind outside Adelaide. The agricultural society has a good showground where two shows are held annually. Two splendid lakes lie near the town—Blue Lake, 960 acres in extent, and Valley Lake, 97 acres, from the first of which the water-supply of the town is derived. Mount Gambier is the centre of one of the richest grain-growing districts in Australia. Pop. (1901), 3162; and including the suburbs, about 8000.

**MOUNT HOLYOEK COLLEGE,** the pioneer institution in America for the higher education of women, situated in the village of South Hadley, Massachusetts, near Mount Holyoke. It was founded by Mary Lyon (q.v.), and was chartered as Mount Holyoke Female Seminary in 1836 (opened in 1837), but the name was changed to Mount Holyoke College in 1853. Besides the lecture halls and laboratories there are the Dwight Memorial art building (1901), a library building (1905), the John Payson Williston observatory, botanical gardens (1913), a gymnasium, a hospital, and seven residence halls. For undergraduate the college offers two years of work in prescribed courses in Latin, Greek, French, German, English, history, Biblical literature, prose literature, physics, and chemistry, and two years of work in elective courses; for graduates it offers one year of advanced work, including courses in education designed for those preparing to teach. To make college expenses possible the women graduates pay fees, and some are employed on the college farms. A large number of the students engage in practical work in the college workshops. A number are employed in families and in hotels; a few hold positions in the stores and offices of the town.
lighter and to "promote a spirit of democracy and of consideration for others" every student helps either in housework or in the academic departments. In 1908-1909 the college had 110 instructors and 748 students.

MOUNTJOY (or MONTJOY), BARONS AND VICOUNTS.

Sir Walter Blount (d. 1474), of Elvaston, Derbyshire, grandson of Sir Walter Blount, who was an adherent of John of Gaunt, succeeded his father, Sir Thomas Blount, as treasurer of Cahir in 1460, becoming governor a year later as a reward for service rendered in the battle of Towton. Edward conferred on him rich estates forfeited by the earl of Devon; and in 1465 Blount was made lord high treasurer and created Baron Mountjoy. This creation is noteworthy as one of the earliest examples of a baronial title not being of a territorial character; nor the title of a dignity already existing. Blount’s great-grandfather had married Isolda, daughter and heiress of Sir Thomas de Mountjoy, and the title was probably chosen to commemorate this alliance.

William Blount, 4th Baron Mountjoy (c. 1478-1534), was famous as a scholar and a patron of learning. He was a pupil of Erasmus, who called him inter nobles doctissimus. His friends included Colet, More and Grocyn. He held a command in the force sent to suppress Perkin Warbeck’s rebellion in 1497. In 1513 he was appointed governor of Tournai, and his letters to Wolsey and Henry VIII. describing his vigorous government of the town are preserved in the British Museum. He was present with Henry VIII. at the Field of the Cloth of Gold in 1520, and at the meeting with Charles V. in 1522. He had been master of the mint since 1509, and chamberlain to Catherine of Aragon since 1512. He returned to this office to announce to the queen Henry’s intention to divorce her; he also signed the letter to the pope conveying the king’s threat to repudiate the papal supremacy unless the divorce were granted. Mountjoy, who was one of the wealthiest English nobles of his time, died in 1534. His son Charles, 5th Baron Mountjoy (1526-1544), was also a patron of learning.

Charles Blount, earl of Devonshire and 8th Baron Mountjoy (1503-1566), lord-deputy of Ireland, grandson of the preceding, was the most notable of the later holders of the title. The favour which his youthful good looks procured for him from Queen Elizabeth excited the jealousy of the earl of Essex, and led to a duel between the two courtiers, who, however, soon became close friends. Between 1586 and 1598 he was much on the continent, serving in the Netherlands and in Brittany. He joined Essex and Sir Walter Raleigh in their expedition to the Azores in 1597, his brother, Sir Christopher Blount (1565-1601), who was afterwards executed for complicity in Essex’s treason, being also of the party. In 1600 Mountjoy went to Ireland as lord deputy in succession to Essex, where he succeeded in suppressing the rebellion of Hugh O’Neill, earl of Tyrone, whom Essex had failed to subdue. In July 1601 Mountjoy made himself master of Lough Foyle, and in the following December he defeated O’Neill’s Spanish auxiliaries at Kinsale, and drove them out of the country. In 1602 the earl of Tyrone made his submission to Mountjoy in Dublin (see O’NEILL); and on the accession of James I. Mountjoy was continued in his office with the more distinguished title of lord-deputy. Returning to England, he was one of Sir Walter Raleigh’s judges in 1603; and in the same year he was made master of the ordnance and created earl of Devonshire, extensive estates being also granted to him. He died in London on the 3rd of April 1621. About 1590 Mountjoy took as his mistress Penelope, wife of Lord Rich and sister of the earl of Essex. After the death of her brother in 1601, Lady Rich was divorced from her husband in the ecclesiastical courts. Mountjoy, by whom she had already had several children, was married to the lady in 1605 by his chaplain, William Laud, afterwards archbishop of Canterbury. As he left no legitimate children the earl’s titles became extinct at his death.

His eldest natural son by Lady Rich, Mountjoy Blount (c. 1597-1660), inherited a large property by his father’s will, and was a favourite with James I. The family title was revived in his favour in 1618, when he was created Baron Mountjoy, of Mountjoy Fort, Co. Tyrone, in the peerage of Ireland; and Baron Mountjoy of Thurveston, Derbyshire, in the peerage of England. In 1628 he was further created earl of Newport in the Isle of Wight. In the same year he was appointed to command, with the rank of rear-admiral, the expedition for the relief of Rochelle; in 1634 he was made master of the ordnance. He took the popular side at the beginning of the trouble between Charles I. and the parliament, and was an eager opponent of Strafford. When the Civil War broke out, however, Newport served in the royalist army, and took part in the second battle of Newbury in 1644. In January 1646 he was taken prisoner and confined in London on parole. He died at Oxford on the 12th of February 1666, leaving two surviving sons, who in turn succeeded to the earldom of Newport and barony of Mountjoy. Both titles became extinct on the death of Henry, the younger of these sons, in 1685.

In 1683 Sir William Stewart (1653-1692), who owned large property in the counties of Donegal and Tyrone, and Anne Stewart, daughter and heiress of Alexander Stewart, second son of the above-mentioned William, 1st Viscount Mountjoy, married Luke Gardiner, vice-treasurer of Ireland; and her grandson, Luke Gardiner (1745-1798), who inherited a large portion of the Mountjoy family estates, was created Baron Mountjoy of Mountjoy, Co. Tyrone (1780), and Viscount Mountjoy (1793), both in the peerage of Ireland; but on the death without male issue in 1829 of his son Charles John, who in 1816 was created earl of Bellingston, all these titles again became extinct.

Thomas Windsor, or Hickman-Windsor (c. 1670-1738), second son of Thomas, Lord Windsor de Stanwell, 1st earl of Plymouth, was in 1699 created Viscount Windsor of Blackcastle, in the peerage of Ireland. In 1712 he was created a peer of Great Britain with the title of Baron Mountjoy of the Isle of Wight, being descended in the female line from Sir Andrew Windsor (c. 1475-1543), 1st Baron Windsor de Stanwell, who married Elizabeth Blount, sister and co-heir of Edward, 2nd Baron Mountjoy of the first creation, who died an infant in 1475. On the death of Thomas’s son Herbert in 1738 the title of Mountjoy again became extinct; but it was revived in favour of John Stuart, earl of Bute, who married Charlotte Jane Hickman-Windsor, Herbert’s daughter and sole heiress, and who in 1756 was created Viscount Mountjoy of the Isle of Wight, earl of Windsor, and marquess of the county of Bute, all of which titles are held by his descendant, the present marquess of Bute.

MOUNTMELlick, a market town of Queen's county, Ireland, pleasantly situated on the Owczes (an affluent of the Barrow) which nearly encircles it. Pop. (1901), 2407. It is the terminus of a branch of the Great Southern & Western railway, 73 m. N. of Maryborough and 85 m. W.S.W. of Dublin. A branch of the Grand Canal also reaches the town, providing water communication with Dublin, and with Waterford by the river Barrow. There are industries of melting, tanning, woollen and salt manufactures, and iron-founding. A settlement of Quakers has contributed largely to the prosperity of the town. A provincial school of the Leinster Society of Friends was founded here in 1796.

MOUNT MELINTON, a municipality of Raglan county, Queensland, Australia, 28 m. by rail S.S.W. of Rockhampton. Pop. (1901), 6280. Railway communication was opened in 1898. The town has been considered to stand on the richest gold site in Australia, the gold being very fine and pure.

MOUNT SORREL, a market town in the Loughborough (Mid) parliamentary division of Leicestershire, on the river Soar, 7 m. N. of Leicester. Pop. (1901), 2417. The Silkye station on the Midland main line lies 1½ m. E. The position is beautiful, a steep hill, once occupied by a castellated wooden chapel. At Barrow-upon-Soar, 2½ m. N. (Pop. 2409; Barrow and Quorn railway station), lime is worked extensively. The village of Quorn on Quorn, 1½ m. N.W., is the headquarters of the well-known Quorn hunt. Quornon is an urban district (pop. 2173).

MOUNTSTEPHEN, GEORGE STEPHEN, Baron (1829– ). Canadian financier, was born on the 5th of June 1829 at Duffin town, Banffshire, Scotland, the son of William Stephen and Elspeth Smith. He was educated at the parish school, after which he went for a time a seafaring boy. In 1850 he went to Canada and soon became a prominent business man in Montreal. In 1858 he joined with his cousin, Donald Smith (afterwards Lord Strathcona), in the purchase of the St. Paul & Pacific railway. This led to his interest in the development of western Canada, and from 1881 onwards he was associated with his cousin in the construction of the Canadian Pacific railway, for his services in connexion with which he was in 1886 made a baronet, in 1891 raised to the peerage; and in 1905 made G.C.V.O. In 1888 he left Canada, and thereafter lived in England and Scotland. He gave lavishly to charity and education, and with Lord Strathcona built and endowed the Royal Victoria hospital at Montreal.

MOUNT-Temple, William Francis Cowper-Temple, Baron (1831–1888), English politician, second son of the 5th Earl Cowper, was born at Brocket Hall, Hertfordshire, on the 13th of December 1831. He was educated at Eton, and entered the Royal Horse Guards, attaining the rank of brevet-major in 1852. His mother, Emily Mary, was sister to the prime minister, Lord Melbourne, whose secretary William Cowper became in 1835; in this year he entered parliament as member for Hertford, which he continued to represent until 1863. As commissioner of works (1860–1866) he carried the bills for the Thames Embankment (1862), and for the new law courts (1863); but he is best known for the amendment, known as the “Cowper-Temple clause,” which he introduced into the second reading of the Education Bill of 1870, that no catechism nor denominational teaching of any kind should be included in the religious instruction given in rate-aided schools. His mother, who married Lord Palmerston as her second husband, died in 1869, and under his stepfather's will William Cowper succeeded to some of the Palmerston estates in Ireland and Hampshire, and assumed the additional name of Temple. He was M.P. for South Hampshire from 1868 until 1850 when he was raised to the peerage as Baron Mount-Temple of Mount-Temple, Sligo. He died at Broadlands, near Romsey, on the 16th of October 1888. He was twice married, but left no children, the Palmerston estates descending to the Right Hon. Evelyn Ashley (1836–1907), who was under-secretary of state for the colonies from 1882 to 1885.

MOUNT VERNON, a city and the county-seat of Jefferson county, Illinois, U.S.A., about 197 m. E. by S. of St Louis. Pop. (1890), 2333; (1900), 5216 (111 foreign-born); (1910), 8077. It is served by the Chicago & Eastern Illinois, the Louisville & Nashville, the Wabash, Chester & Western, and the Southern railways. It is the headquarters of the fourth appellate court district of the state. Mount Vernon was settled in 1819, incorporated as a village in 1837 and chartered as a city in 1872. Many of its buildings were destroyed by a cyclone on the 19th of February 1888.

MOUNT VERNON, a city and the county-seat of Posey county, Indiana, U.S.A., on the Ohio river, in the extreme south-west corner of the state. Pop. (1890) 4705; (1900), 5132, including 892 negroes and 262 foreign-born; (1910), 5563. It is served by the Evansville & Terre Haute, the Louisville & Nashville, and the Evansville & Mount Vernon (electric) railways. The city is a trading centre for the surrounding farming region. It has a valuable river trade, and various manufactures. The first settlement here was made in 1803, and in 1819 a town was laid out and named Mount Vernon. It became the county-seat in 1825, and was incorporated as a town in 1846 and chartered as a city in 1865.

MOUNT VERNON, a town of Linn county, Iowa, U.S.A., 16 m. E. of Cedar Rapids. Pop. (1900), 1629; (1910, U.S. census), 1532. Mount Vernon is served by the Chicago & North Western railway. It is the seat of Cornell College (Methodist Episcopal; coeducational), which was opened as the Iowa Conference Seminary in 1853, and was chartered in 1857 under its present name, adopted in honour of William W. Cornell (1823–1870), an iron manufacturer of New York City and a benefactor of the institution. Cornell College includes a collegiate department, an academy, a conservatory of music, a school of art, a school of oratory and a summer school; in 1907–1908 it had 40 instructors and 755 students. Mount Vernon was settled in 1842, was laid out in 1847, and was incorporated as a town in 1869.

MOUNT VERNON, a city of Westchester county, in south-eastern New York, U.S.A., on the Bronx river and Eastchester Creek, 13 m. from the Grand Central station, New York City. Pop. (1890), 10,830; (1900), 20,346, of whom 5265 were foreign-born (many being Italians) and 516 negroes; (1910, census), 30,910. It is served by the New York Central & Hudson River and the New York, New Haven & Hartford railways, and by lines to New York City, Yonkers, New Rochelle, &c. The city has various manufactures, but in the main is a residential suburb of New York; the finest residences are in the eastern, central and north-eastern sections, the last being known as Chester Hill; the foreign-born element is largely concentrated in the western part. Mount Vernon is in the township of Eastchester, which was settled from Connecticut in 1664, possibly in the hope of pushing Connecticut’s boundary nearer the Hudson. It was called “Ten Farms” or East Chester. A parish of the same name was established in 1693, but was disallowed in England. About 1682 the “Ten Farmers” established a free school. In 1764 the foundations were laid of the present St Paul’s (Protestant Episcopal), which was used through a part of the American War of Independence as a British military hospital. St Paul’s churchyard dates back to the close of the 17th century. Along the White Plains road (now Lincoln Avenue) Washington retreated, pursued by General Henry Clinton, before the battle of White Plains in 1776. The city of Mount Vernon was founded in 1851 by several realty companies. The postal authorities objected to the name Monticello, originally used, and Mount Vernon was adopted instead. Mount Vernon was incorporated as a village in 1853 and was first chartered as a city in 1892. West Mount Vernon was founded by the Teutonic Homestead Association and was annexed to Mount Vernon in 1869.

MOUNT VERNON, a city and the county-seat of Knox county, Ohio, U.S.A., on the Kokosing river, about 45 m. N.E. of Columbus. Pop. (1890), 6077; (1900), 6633, including 359 foreign-born and 239 negroes; (1010), 9087. Mount Vernon is served by the Baltimore & Ohio and the Cleveland, Akron & Columbus, railroads. It is the seat of the state hospital for tuberculosis, has a fine court-house, a public library, and various manufacturing establishments. Natural gas is found in the vicinity. Mount Vernon was laid out in 1805; it became the county-seat in 1807, was incorporated as a town in 1845, and became a city in 1853.

MOUNT VERNON, the former home of George Washington, in Fairfax county, Virginia, U.S.A., on the Potomac river, 15 m. below Washington, D.C., reached by steamers from Washington and by electric railway from Alexandria, Virginia. The mansion-house, which is the centre of interest, stands on a bluff overlooking the river. The house is built of wood, but the siding is of wide thick boards so panelled as to give the appearance of cut and dressed stonework. The rooms contain much of the furniture which was in them when they were occupied by General Washington and his family; and the furniture that had been lost has been in part replaced by other furniture of historic interest and of the style in use in Washington's day. In the main hall hangs a glass casket containing the key to the cell which Washington received from the French in 1790. From each end of the cell is a curved colonnade and a pavement leads westerly to a row of out-buildings which partially enclose a bowling green and spacious lawn with shaded drives and walks, and beautiful gardens (with trees planted by Washington, Franklin, Jefferson, Lafayette and others). A short distance south-west of the mansion-house and between it and the wharf is a plain brick tomb, which was built by Washington's direction on a site chosen by himself, and contains the remains of Washington and Mrs Washington (removed to the present mansion-house from the old family vault in 1851), and about thirty relatives—members of the families of Gadsby, Blackburn, Corbin, Bushrod, Lewis and Custis families. The estate, originally called "Little Hunting Creek Plantation," was devised in 1766 by John Washington (the first of the family in America) to his son, Lawrence, who in turn devised it to his daughter, Mildred, by whom (and her husband Roger Gregory) it was devised in 1726 to her brother Augustine (George Washington's father). On Augustine's death (1743) it passed to Lawrence (George's half-brother), who built in 1743 to 1745 that mansion-house, which forms the middle portion of the present mansion-house and named it Mount Vernon, in honour of his former commander, Admiral Edward Vernon (1664-1755). Lawrence left it (1759) to his widow Anne Fairfax (who in the same year married George Lee) with the proviso that it should pass at her death to George Washington, who meanwhile rented the estate, gaining full possession at her death in 1761. In 1754-1755 he enlarged the villa into the mansion-house with its present dimensions by building an addition at each end, erected several of the out-buildings, and adorned the grounds, all according to his own plans and specifications. At General Washington's death (1799) Mount Vernon passed to his widow, at her death (1802) to her nephew, Bushrod Washington, and at Bushrod Washington's death (1831) to his nephew John Augustine Washington, who devised it (1832) to his widow, by whom it was devised in 1835 to their son John A. Washington. This last was authorized by his father's will to sell the estate to the United States government, and in 1847 offered the property for $100,000, but the offer was refused. In 1862 the mansion-house and 200 acres of the original estate, fast falling into decay, were bought for $200,000 (much of which has been raised through the efforts of Edward Everett) by the Mount Vernon Ladies' Association of the United States. This association under its charter (1859) bound itself to restore the estate as far as possible to the condition in which it was in the lifetime of Washington and to keep it sacred to his memory, and Virginia agreed to exempt it from taxation as long as these terms were fulfilled.

See B. J. Lossing, The Home of Washington: or Mount Vernon and its Associations (Hartford, 1879).

MOURNING (from the verb "to mourn," to be sorrowful, O. Eng. mornan; cf. O.H.G. mornan, O.S. mournan, to be anxious, O.N. moran; also, in the sense of "to be grieved," to die; by some referred to root µor, sorrow, by others to root mer-, to die), the expression of grief or sorrow particularly for the dead; more specifically the outward or conventional signs of such grief. The public exhibition of this grief for the dead has taken various forms among different races and in different ages, from shaving of the head, or allowing the beard and hair to grow, from disfiguring the face and uttering loud wailing cries, to the wearing of clothes of a particular colour, now among Western races usually black, and to the purely conventional costume of using black-edged note-paper, cards, &c. (See further Funeral Rites.)

MOUSE, in its original sense probably the name of the semi-domesticated house-mouse (Mus musculus), the type of the genus Mus and of the family Muridae. Zoologically, there is no distinction between mice and rats; these names being employed respectively for most or all of the smaller and larger "mouse-like" and "rat-like" representatives of the Muridae, whether they belong to the genus Mus or not. It is true indeed that in zoological nomenclature some of these are distinguished as "voles" (see Vole), but this is not in accord with popular usage, where such creatures come under the designation either of water-rats or field-mice. The distinctive characters of the typical mice (and rats), i.e. those possessed by the genus Mus, has spread to all the inhabitants of the genus M. sylvaticus, the house-mouse, originally a native of Europe, has spread to all the inhabitants of the genus M. sylvaticus, is a species common in many parts of England, often taking to barns and out-houses for shelter during the winter. It is of about the same size and proportions as M. musculus, but of a bright reddish-grey colour, with a pure white belly. M. minutus, the harvest-mouse, is the smallest of the European mice, seldom exceeding 2/3 or 3 in. in length; and of a yellowish-red colour, with comparatively short ears and tail. It lives entirely away from houses, commonly taking up its abode in wheat or hay fields, where it builds a round grass nest among the tops of the grass, in which it sleeps. It ranges from England to Japan. M. longicauda, the first it is noteworthy that house-mice isolated on a small sandbank near Dublin have developed a special colouring of their own; also that distinct local varieties, M. musculus muralis and M. m. faeobensis, inhabit respectively St Kilda and the Faeroes. In Central Asia there exists a wild mouse (M. batranius), and likewise a second species (M. wagleri), with the habits of a house-mouse, both of which are closely allied to M. musculus; while there is a third kind (M. gentilis), also nearly related, in the deserts of North Africa. According to G. E. H. Barrett-Hamilton it is probable that M. batranius and M. musculus are respectively desert and house modifications descended from some Central Asian ancestor more or less nearly allied to M. wagleri. As regards the other two British species, it must suffice to say that there are several local races of each; M. sylvaticus being represented by several in the British Isles, although there is but one British representative of M. minutus. It may be added that by some naturalists both M. sylvaticus and M. minutus are separated from M. musculus as Micromys.

MOUSE-BIRD—MOUTH

MOUSE-BIRD (Du. Muisvogel), the name by which in Cape Colony and Natal the members of the genus Colius of M. J. Brisson are known—probably from their singular habit of creeping along the boughs of trees with the whole tarsus applied to the branch. By the earlier systematists, Colius was placed among the Fringillidae; but the investigations of J. Murie and A. H. Garrod on its internal structure showed that it was not a true Passerine, and it is now placed in a separate family, Colidae, amongst Coraciiform birds, near the trogons and swifts (q.v.). The Colidae are small birds, with a rather

finch-like bill, a more or less crested head, a very long tail, and generally a dun or slate-coloured plumage that sometimes brightens into blue or is pleasingly diversified with white or chestnut. They feed almost wholly on fruits, but occasionally take insects, in quest of which they pass in bands of fifteen or twenty from tree to tree. Seven species are believed to exist, all belonging to the Ethiopian region (of which the Family is one of the most characteristic), and ranging from Abyssinia southwards. Three species inhabit Cape Colony. (A. N.)

MOUSORGSKY, MODERE PETROVICH (1835-1881), Russian composer, was born at Karovo, government of Pskov, in March 1835, and entered the army at an early age. He came of a musical family, and was himself a talented amateur, and an acquaintance with Balakirev and Dargomyski led him to more serious study of composition, so that in 1857 he left the army and devoted himself to music, though this step entailed his earning his living as a government clerk and a prolonged period of poverty. His greatest opera, Boris Goudounov, based on Pushkin’s drama, was produced in St Petersburg in 1874, and on it his reputation stands as one of the finest creative composers in the ranks of the modern Russian school. He also wrote a number of songs and orchestral works, of a realistic national type. In later life he suffered much from ill-health, and died in St Petersburg on the 16th (28th) of March 1881.

MOUSTACHE, or MUSTACHIO, the hair worn unshaven on the upper lip (see BEARD). The spelling "moustache," now the most common in English usage, is the French form of Ital. mustachio, an adaptation of a Doric dialectal μυστακίον, upper lip, also hair on the lip; this is generally taken to be a variant of μύστακα, jaws, mouth, connected with μύστη, "masticate," to chew, cf. "mastic" chewing-gum, and "masticate," to chew. The mastic gland, one of the sublingual glands, and on to which most of the ducts of that gland open. (For a description of the Tongue and the Teeth see special articles on those structures.)

The salivary glands are the parotid, submaxillary and sublingual, though the small scattered glands such as the labial, buccal, molar, lingual, &c., probably have a similar function.

The parotid gland (Gr. πατον beside, &c., ear), is the largest of these glands, and is situated between the ear and the ramus of the mandible. In a transverse section through the head about the level of

of Man of the Olom type, that is, nearly as dolichocephalous as the Neanderthal type, but with superciliary ridges flat, and frontal bones high, and by the occurrence of the musk-ox, the horse, the cave-bear, Rhinoceros tichorhinus and the mammoth. The typical implements are flint points or spear-heads, left smooth and flat on one side, as struck from the cave, pointed and edged from the other side; a scraper treated in the same way, but with edge rather upon the side than at the end, as in the succeeding Solutrian and Madelepine epochs. Relics of the Monsterian age have been also found in Belgium, southern Germany, Bohemia and southern England, some of the "finds" including human remains.

MOUTH AND SALIVARY GLANDS. The mouth (A.S. modh), in anatomy, is an oval cavity at the beginning of the alimentary canal in which the food is masticated. The opening is situated between the lips, and at rest its width reaches to the first premolar tooth on each side. The lips (A.S. ðippe) form the sides of the mouth and are continuous with the cheeks, the mucous membrane connected with thick fibrous tissue to the periosteum of the jaws. Round the base of the crown of each tooth the membrane rises up into a little collar.

The vestibule of the mouth is the space between the lips and cheeks, and the gums and teeth deeply. It communicates with the true cavity of the mouth by the clefts between the teeth and by the space behind the last molar teeth.

The roof of the mouth is concave transversely and antero-posteriorly, and is formed by the hard and soft palate. The hard palate consists of mucous membrane continuous with that of the gums and bound to the periosteum of the palatine processes of the maxillae and palate bones by firm fibrous tissue. In the mid-line is a slight ridge, the palatine raphe, which ends in front in a little eminence called the palatine papilla, marking the position of the anterior palatine canal. From the anterior of the raphe five or six transverse ridges or ruge of the mucous membrane run outward. (For a description of the soft palate see PHARYNX.)

The floor of the mouth can only be seen when the tongue is raised, then the reflection of the mucous membrane from the gums to it is exposed. In the mid-line is a prominent fold called the frenum linguae, and on each side of this a sublingua papilla, on to the summit of which the duct of the submaxillary gland opens. Running outward and backward from this is a ridge called the plica sublingualis, which marks the upper edge of the sublingual gland, and on to which most of the ducts of that gland open. (For a description of the Tongue and the Teeth see special articles on those structures.)

The salivary glands are the parotid, submaxillary and sublingual, though the small scattered glands such as the labial, buccal, molar, lingual, &c., probably have a similar function.

The parotid gland (Gr. πατον beside, &c., ear), is the largest of these glands, and is situated between the ear and the ramus of the mandible. In a transverse section through the head about the level of
the mouth the gland looks more or less triangular, its outer wall or base being bounded by the parotid fascia, its anterior by the jaw, and its posterior by the mastoid process and sternomastoid muscle. Where the anterior and posterior walls meet to form the apex is the styloid process. Above the gland reaches to the zygoma, and below to the level of the angle of the jaw, where a strong process of the deep cervical fascia, called the stylo-mandibular ligament, separates it from the submaxillary gland; indeed the parotid is often described as lying in a bag formed by deep cervical fascia. The outline of the gland is obscured by several processes, one of which, the facial lobe, runs forward, superficial to the masseter muscle, accompanying the duct, a separate part of this is called the serra parotidea; another, known as the pharyngeal lobe, passes forward, deep to the ramus of the jaw, to the space between the two pterygoid muscles. A third wraps round the front of the styloid process and may be flattened surface rests against the sublingual fossa in the lower jaw, while the inner side is in contact with the outer side of the buccinator muscle, the submaxillary duct and the lingual nerve. Its upper edge forms the sublingual fold (placa sublingualis) in the mucous membrane of the mouth, and along this its ducts, which are small and numerous, open. These are sometimes called the Wharton's ducts, but the term "sublingual ducts" is simpler and more expressive. Occasionally an anterior sublingual duct (duct of Bartholin) opens with or into the submaxillary gland.

Embryology.

The fore-gut (see ALIMENTARY CANAL) at first ends blindly, ventral to the region of the hind brain, while in front of it is the overhanging fore-brain. When the heart develops, ventral to the fore-gut it also projects forward towards the head, the transverse cleft, without any lateral boundaries and lined by ectoderm, is left between these two structures. This is the stomato-daeum or primitive mouth, the ectoderm of which rests against the endoderm of the fore-gut to form the buccopharyngeal membrane, and so separates the two chambers. The position of this membrane does not correspond to the fauces or hinder limits of the adult mouth, but is more obvious, so that the front part of the roof of the pharynx is formed by stomatodaeum while the greater part of the floor of the permanent mouth is fore-gut. During the third week the membrane disappears, and it is probable that to its early atrophy is due the fact that no tracts of it can be seen in the adult. Growing down from the region of the fore-brain is the fronto-nasal process, which forms the nose and the middle piece of the upper lip, while the lateral parts of the mouth are closed in by two pouches, one on each side of which the lower end of the process rapidly meets its fellow in the mid-line to form the lower jaw and lip, thus separating the heart from the mouth cavity. The parotid or maxillary glands grow inward in this way, last joins with the fronto-nasal process, and in the adult the lines of union are seen on each side as ridges of skin which run down from the nostril to the margin of the lip, and enclose that slightly depressed vertical path to which the term philtrum is given. Besides forming the philtrum the fronto-nasal process is responsible for that part of the roof of the mouth which corresponds to the premaxillary bone, hence two lines drawn on each side from between the lateral incisor and canine teeth to the palatine papilla. At first the cavities of the mouth and nose are one, but they are later divided by the palatal processes, which grow in like shelves from the fronto-nasal process and meet in the mid-line. The submaxillary and sublingual sialogy glands develop as solid outgrowths of the buccal epithelium which are canalized later, the parotid according to Hammar (Archiv. f. mikr. Anat. LXI., 1902) appears first as a groove. The parotid is ectodermal in origin, all the others endodermal.

For further details and literature see Quain's Anat. vol. i. (London, 1898). P. McMurtrie Development of the Human Body (London, 1907); O. Hertwig, Handbuch der Entwicklungsllehre Th. 11. (Jena).

Comparative Anatomy.

In the acrania (amphious) the mouth is developed on the left side and gradually shifts to the mid-line; later an extra chamber, the homolabium, is formed on the right side, which is provided with bristle-like cirri, so that in the adult the mouth is merely an aperture in the velum or membrane which separates the oral from the pharyngeal cavity.

In the cyclostoma (lampreys and hags) the mouth is a suctorial organ, and resembles a funnel, the narrow end of which opens into the pharynx. It is always open and is provided with horny teeth and a tongue. At this low stage of the vertebrate scale no jaws have yet appeared, but in the larval lamprey (ammocoetes) an oral hood, resembling that of amphious, is present. In the fishes jaws are present and the mouth can be closed at will. In the elasmobranchs (sharks and rays) the opening is crescentic and situated well on the ventral surface of the head, but in other fishes it is at the anterior end of the body. Until the dipnoi (mud fish) the position of the nostril in the mouth is such that there is no communication between the mouth and the nose, but in these fishes the internal or posterior nares open into the front part of the roof of the mouth, thus adapting them to air-breathing. In the Amphibia the mouth has usually an enormous gap between its parts, and the nostrils are nasal nares which lie beyond the mouth. It will be noticed that at this stage of phylogeny the condition resembles that of the ontogeny of man before the palatal processes appear. The palatal process separates the nasal cavity from the mouth in front, but behind that the cavity is the rudiment of the mouth and nose which no palate has yet appeared to separate. In Reptiles the hard palates are present, but the term nasal nares is sometimes used of the nasal processes only. In Mammals definite lips provided with muscles first appear, though the Monotremes have such specialized mouths that lips are not found in that order. Monkeys have the vestibule enlarged to form much deeper pouches.

Surgery of the Mouth.

In surgical operations upon the interior of the mouth which are likely to be accompanied with much bleeding, it is much the
custom now to have the patient lying upon his back, with the head hanging over the end of the table, so that the blood may sink into the dome of the pharynx and escape by the nostrils, instead of running the risk of finding its way into the windpipe and lungs. (See CLIFFE PALATE.)

Mumps.—Inflammation of the parotid gland is apt to occur as an epidemic, children being chiefly attacked. The disease, which is highly infectious, is called mumps, and is associated with much swelling below and in front of the ear, or ears. There is stiffness of the jaw and there is a difficulty in swallowing. There is slight local tenderness, and the temperature may, perhaps, run up a degree or two. For the sake of others, the child should be kept away from school for three or four weeks.

3. Reed Mouthpieces.—There are three kinds of reed mouthpieces: the double, the single or beating, and the free reed. The function of the reed, a term originally applied to part of a stalk of the Arundo donax or salvia, but now extended to any vibrating tongue of wood or metal, is to break up an exciting current of air, otherwise flowing in an uninterrupted stream, into regular beats or pulses, corresponding with the beats or vibrations of the reed. Reeds proper or wooden vibrators, being flexible, are compelled to vibrate synchronously with the column of air within the tube and to accommodate their frequency of vibration to the length of the tube as it varies according to the lateral holes which remain open. The double reed is the most primitive and probably the oldest of the reed mouthpieces; it was used by the ancient Egyptians. A straw Fig. 1.—Diagram flattened at one end and inserted into a pipe, is used at the mouthpiece with the same effect as the straw contains all the rudimental features of the double-reed mouthpiece common to the members of the oboe family, i.e., cor anguis, bassoon, contra-fagotto, to the sarrusophone, and to the ophicleide. The barrel of the wind-instrument is supplied with compressed air by the mouth of the performer, whose lips do not come into contact with the reed, a method which makes the production of harmonics impossible, and thus restricts the natural scale. As soon as the practice of over-blowing, i.e., the production of harmonics by increased pressure of breath accompanied by a proportional tension of the lips, became known, the air-chamber mouthpiece may be made.

3 A case excavated in Egypt was found to contain two pipes, and in addition five pieces of reed without bore or holes, and three pieces of straw suitable for making double- Reed mouthpieces. See Victor Loret, "Les Flûtes égyptiennes antiques," Journal asiatique (Paris, 1889), 8], xiv. pp. 119, 200, 201 (note), 207, 211 and 217.
of the oboe was discarded and the reed taken directly into the mouth. It is certain that the ancient Greeks obtained the full compass of the aulos by overblowing, since the process by which a modern performer on the oboe of the modern obturator nature harmonics is described by Aristotle1 and others.2 The vibrating length of the reed is controlled by moving the left hand over a reed mouthpiece. The shorter the free end the higher the pitch of the note or harmonic obtained. The action of the breath on the reed is regulated in some extent in organ-pipes by means of a tuning-wire, with the difference that, the lips being mobile, different notes can be obtained from the same reed as in the organ. The reed is adapted to its own pipe and gives one note only. B. The beating- or single-reed mouthpiece, also known as the clarinet mouthpiece, is likewise of great antiquity; the principle is the same as that of the modern Egyptian argould (q.v.), which has been traced once at least in the hieroglyphics and in a fresco from the tombs at Saqqara.3 The mouthpiece of the argould is the primitive form of gap between the lips, the wide, narrow, and variously cut reeds and curving slips of gold or silver. The principal feature of the cup is the shape of the aperture in the bottom, where it communicates with the bore of the tube (known as the "grain" or "throat"), and its distance from the mouth. The shallower the cup the more suitable it is for producing the higher harmonics. The lips of the performer rest lightly but firmly against the rim of the mouthpiece, vibrating like double reeds from the force of the breath and communicating these vibrations in the form of pulsations to the breath as it issues from them in a stream. This stream or exciting current passes into the cup ready to generate sound-waves in the air column contained within the main tube. If, as in the trumpet and in a lesser degree in the trombone, the curve of the bottom of the cup terminates at the hole in an abrupt angle, the quality of the tone developed is of a lower order, the cup being broken up by the sharp edge of the throat. In the horn, which has a funnel-shaped mouthpiece, the timbre is in complete contrast when the instrument is properly played,4 being elastic, sonorous and very mellow, qualities which may be attributed to the absence of angle or bottom to the cup, the sides gradually sloping and converging insensibly into the bore of the tube.5

4 Cup-Mouthpieces.—Brass wind instruments are played by means of cup or funnel-shaped mouthpieces, generally made of silver. The principal feature of the cup is the shape of the aperture in the bottom, where it communicates with the bore of the tube (known as the "grain" or "throat"), and its distance from the mouth. The shallower the cup the more suitable it is for producing the higher harmonics.

MOVERS, FRANZ KARL (1866–1896). German Roman Catholic divine and Orientalist, was born at Kiel in Westphalia, on the 17th of July 1866. He studied theology and Oriental languages at Münster, was parish priest at Berkum near Bonn from 1833 to 1839, and professor of Old Testament theology in the Catholic faculty at Breslaus from 1839 to his death on the 28th of September 1896. His elaborate works, Die Phönizier (1841–1856) and Phönizische Texte, erklärt (1847–1857), attained a high reputation. Of his other writings two biblical studies were of some importance, his Kritische Untersuchungen über die alltestamentliche Chronik (1854), and his Latin essay on two recensions of the text of Jeremiah, De utriusque recensiones vacatiorum Jeremiae...indole et origine (1857).

MOW. (1) To cut down standing hay or corn with a scythe or with machinery drawn by a horse or mechanical power (see REAPING). The word in O.Eng. is mawen, a verb common to the West German languages, cf. Du. maaien, Ger. mähen; the root is also seen in "meadow," Gr. ἑαδω and Lat. metere, to reap, cut, cf. messis, harvest. (2) A stack or rick of hay, corn, and sometimes also of beans, peas or other crops. The word in O.Eng. is muige, maha, and is cognate with Swedish and Norwegian maga, heap, cf. Swedish odlmage, crowd of people, Danish omlæue, "Mow" is chiefly dialectal in England, where it is a common name, e.g. the Barley Mow, on the sign-boards of country inns.

From these two words must be distinguished (3) "mow," a grimace, now obsolete or purely literary, and generally found in combination with "mop," cf. "mopping and mowing" in King Lear, iv. l. 64. This is the same word as the modern Fr. moue, pout, which is of obscure origin.

MOWAT, SIR OLIVER (1820–1903), Canadian judge and statesman (Q.C. 1856, LL.D. 1872, K.C.M.G. 1852, C.M.G. 1897), was the son of John Mowat, who fought in the Peninsular War under Sir Arthur Wellesley (afterwards duke of Wellington). Born at Kingston, Ontario, on the 22nd of July, 1820, he was educated by private tuition and in 1836 began the study of law under Mr (afterwards the Rt Hon. Sir) John A. Macdonald. Called to the bar in 1841, he soon became a leading Chancery counsel and in 1856 "took silk." He entered parliament in 1858 as a Liberal and in 1863 became postmaster-general. He took a prominent part in the proceedings of the Quebec Conference of 1864, which settled the terms of the Confederation of the British North American provinces, and in the same year was appointed vice-chancellor of Upper Canada. Eight years afterwards (1872) the Hon. Edward Blake resigned the premiership of the province of Ontario, and Mowat was called to fill the vacant post. He continued to be premier of Ontario until the 13th of July 1896. Assisted by able colleagues and holding always a strong majority in the house, he gave to Ontario a

4 The horn may be so played, by forcing the breath in a certain manner, that its timbre approximates to that of the trumpet.
body of laws of many of which have been copied by other provinces of the dominion and by several states of the American Union. In eight important cases which he argued before the Judicial Committee of H. M. Privy Council, he established, as against the contention of Sir John A. Macdonald, the proposition that the provincial legislatures were co-ordinate with and not subordinate to the parliament of Canada. To weaken his influence the Conservatives at Ottawa attempted to extend the boundaries of Manitoba, thereby reducing the area of Ontario; but Mr. Mowat again appealed to the Judicial Committee and was again successful. According to Sir John A. Macdonald, Ontario contained under the "Quebec Act" only 116,762 sq. m.; but Mr. Mowat proved that the area of Ontario was 116,782 sq. m. After he returned home after this great victory he received an ovation unparalleled in the history of any Canadian statesman. One of his prominent characteristics was his loyalty to Britain. Between 1886 and 1896 Canadian trade was depressed, and men were leaving the country in thousands for the United States. Dr. Goldwin Smith and other prominent men advocated commercial union with the United States, viz. that the two countries should maintain a uniform tariff against the rest of the world, with free trade as between themselves. Sir Oliver Mowat said that Canada was saved annexation, but by Sir Leonard Stanhope the movement so completely as to make his party more imperialist than the Conservatives had ever been. In July 1896 he was called to the senate of Canada and made minister of justice. In November 1897 he was appointed lieutenant-governor of his native province, and this office he held until he died at Government House, Toronto, on the 19th of April, 1903.

See C. R. W. Biggar, Sir Oliver Mowat, a Biographical Sketch (Toronto, 1905).

MOWBRAY, the name of an Anglo-Norman baronial house, derived from Moynbray (Manche) in Normandy south of St. Lo. It was founded at the Conquest by Geoffrey (de Moynbray), bishop of Coutances. His brother’s son Robert, who rebelled with him against William Rufus on the Conqueror’s death, was made, after their reconciliation, earl of Northumberland, as his uncle’s heir but was forfeited and imprisoned for life on rebelling again in 1095. A sister of Bishop Geoffrey was mother by Roger d’Aubigny (of Aubigny in the Cotentin) of two sons, Nigel and William, who were ardent supporters of Henry I., and were rewarded by him with great estates in England. Nigel made his mark in the Marches, and was father of William d’Aubigny (‘de Albinii’), first earl of Arundel (see ARUNDLET); Nigel was rewarded with the escheated fief of Geoffrey de la Guerche, of which Melton (Mowbray) was the head, and with forfeited lands in Yorkshire. Nigel married by dispensation, the wife of his cousin, the imprisoned earl, but afterwards divorced her, and by another wife was father of a son Roger, who took the name of Mowbray.

Roger, a great lord with a hundred knights’ fees, was captured with King Stephen at the battle of Lincoln, joined the rebellion against Henry II. (1173), founded abbeys, and went on crusade. His grandson William, a leader in the rising against King John, was one of the 25 barons of the Great Charter, as was his brother Roger, and was captured fighting against Henry III. at the rout of Lincoln (1217). His grandson Roger (1266–1298), who was summoned to parliament by Edward I., was father of John (1286–1322), a warrior and warden of the Scottish March, who, joining in Thomas of Lancaster’s revolt, was captured at Boroughbridge and hanged. His wife, a Braose heiress, added Gower in South Wales and the Bramber lordship in Sussex to the great possessions of his house. Their John (d. 1361) was father, by a daughter of Henry earl of Lancaster, of John, Lord Mowbray (c. 1328–1368), whose fortunate alliance with the heiress of Lord Segrave, by the heiress of Edward I.’s son Thomas, earl of Norfolk and marshal of England, crowned the fortunes of his race. In addition to a vast accession to their lands, the earldom of Nottingham and the marshalship of England were bestowed on them by Richard II., and the dukedom of Norfolk followed (see NORFOLK, THOMAS MOYBRAY, 1ST DUKE OF).

The 1st duke left two sons, of whom Thomas the elder was only recognized as earl marshal. Beheaded for joining in Scrope’s conspiracy against Henry IV. (1405), he was succeeded by his brother John, who was restored to the dukedom of Norfolk in 1424. His son John, the third duke, was father of John, 4th and last duke, who was created earl of Warrene and Surrey in his father’s lifetime (1451). At his death (1475) his vast inheritance devolved on his only child Anne, who was married as an infant to Edward IV.’s younger son Richard (created duke of Norfolk and earl of Nottingham and Warrene), but died in 1481. The heirs of the Mowbrays were then the Howards and the Berkeleys, representing the two daughters of the first duke. Between them were divided the estates of the house, the Mowbray dukedom of Norfolk and earldom of Surrey being also revived for the Howards (1483), and the earldom of Nottingham (1483) and earl marshalship (1485) for the Berkeleys. Both families assumed the baronies of Mowbray and Segrave, but Henry Howard was summoned in his father’s lifetime (1640) as Lord Mowbray, which was deemed a recognition of the Howards’ right; their co-heirs, from 1777, were the Lords Stuart and the Lords Petre, and in 1878 Lord Stuart was summoned as Lord Mowbray and Segrave. The former dignity is claimed as the premier barony, though De Ros ranks before it. Lord Stuart’s son claimed, but unsuccessfully, in 1901–1906 the earldom of Norfolk (1312), also through the Mowbrays. Of the Mowbray estates the castle and lordship of Bramber is still vested in the dukes of Norfolk. The heraldic badge of the house was a mulberry-tree. (J. H. R.)

MOXON, Harry Siddons (1858– ), American artist, was born of English parents at Alexandria, Egypt, on the 5th of August 1858. Left an orphan, he was taken to America by an uncle, who settled at North Adams, Mass. After a year at the United States Military Academy at West Point, he went to Paris and entered the atelier of Léon Bonnat, his first picture, “Aladdin,” bringing him to public notice. He was made a full member of the National Academy of Design in 1891. Subsequently he was best known for his decorative work, especially “The Transmission of the Law,” Appellate Court House; ceiling for the residence of F. W. Vanderbilt; and the ceiling and walls of the library of the University Club—all in New York. This last was executed in Rome, where, in 1903, he was made director of the American Academy.

MOXON, Robert (1627–1688), English printer, was the first person appointed earl of Northumberland between 1680 and 1682. In 1688 he and his uncle Geoffrey, bishop of Coutances, sided with Robert, duke of Normandy, against William Rufus, but they were pardoned at the close of the rebellion. In 1691 Moxon defeated Malcolm Canmore of Scotland, who had invaded England, and in 1693 surprised and slew this king near Alnwick; soon after this event he succeeded to his uncle’s vast estates. In 1693 he led a rebellion which had for its object the transference of the crown from the sons of the Conqueror to Stephen of Amale. Rufus marched against the earl in person, and Moxon shut himself up in Bamborough Castle, but he was captured by treachery, escaped, and was captured again. He was then deprived of his possessions and kept a prisoner for the rest of his life, nearly thirty years.

MOXON, Edward (1801–1859), British poet and publisher, was born at Wakefield in 1801. In 1826 he published a volume of verse, entitled The Prospect, and other Poems, which was received with some favour. In 1830 Moxon was started by Samuel Rogers as a London publisher in New Bond Street. The first volume he issued was Charles Lamb’s Album Verses. Removing to Dover Street, Piccadilly, Moxon published an illustrated edition of Rogers’s Italy, £10,000 being spent upon the illustrations. Wordsworth entrusted him with the publication of his works from 1835 onwards, and in 1839 he issued the first complete edition of Shelley’s poems. Some passages in Queen Mab were the cause of a charge of blasphemy being
made against Mozart in 1841. The case was tried before Lord Denman. Sergeant Talfoord defended Mozart, but the jury returned a verdict of guilty, and the offensive passages were for a time eliminated. In 1840 he published Brown's *Sordello*; and in succeeding years works by Lord Houghton, Tom Hood, Barry Cornwall, Lord Lytton, Browning and Tennison appeared. Edward Mozart died on the 3rd of June 1858, his business being continued by Mr J. B. Payne and Mr Arthur Mozart, who in 1865 published Swinburne's *Aitana in Calydon*; but in 1871 it was taken over by Messrs Ward, Lock & Tyler.

**MOXOS, Mozos**, a tribe of South American Indians living around the head-waters of the Madeira river, northern Bolivia. They are of both Indian and Spanish descent; and both the Portuguese and English were at different times submitted to Inca domination, but in 1566 gallantly repulsed the Spaniards. A century later, however, the Jesuits were welcomed, and the Mozos became devout Catholics. They number some 30,000.

**MOZAMBIQUE** [São Sebastião de Moçambique], a town of Portuguese East Africa, seat of a Roman Catholic bishopric in the province of Goa, in 15° 4' S., 40° 44' E. The town occupies the whole of a small coral island at the mouth of Miosoril Bay. The name Mozambique, used first to designate the island, was afterwards given to the town and extended to the whole of the Portuguese possessions on the east coast of Africa. There are three forts, of which the principal, St Sebastian, at the northern extremity of the island was built in 1510 entirely of stone brought from Portugal. It is quadrangular, and has bastioned walls nearly 70 ft. high. In it are mounted some modern guns. The harbour is small, but deep enough to admit vessels drawing 25 feet.

The inhabitants, who number about 7000, consist chiefly of Malommednegro traders and about 300 Europeans, besides half-caste Portuguese. The annual average value of the exports for the three years 1904-1906 was £97,035, of the exports £71,636. The import trade is chiefly with Great Britain and India, the articles in chief demand being cotton, coloured shawls and hardware. The exports are chiefly groundnuts, rubber of inferior quality, sesameum and other oil seeds, tortoise-shell and ebony. Germany has a large share of the exports.

Mozambique was discovered by Vasco de Gama in 1498. There are Parsee, Banyan, Goanese and Arab traders, and about 300 Europeans, besides half-caste Portuguese. It was applied by the Moslems in Spain to the Christian communities existing among them, in Cordova, Seville, Toledo and other large cities, in the exercise of their own laws and religion. The ancient liturgy used by the Christians of Toledo is commonly known as Mozarabic.

**MOZART, WOLFGANG AMADEUS** (1756-1791), German composer, was born at Salzburg on the 27th of January 1756. He was educated by his father, Leopold Mozart, a violinist of high repute in the service of the archbishop of Salzburg. When only three years old he shared the harpsichord lessons of his sister Maria, five years his senior. A year later he played minuets, and composed little pieces, some of which are still preserved in Maria's music-book. When five years old, he was given the violin for the first time, in the hall of the university. In 1762 Leopold Mozart took Wolfgang and Maria on a musical tour, during the course of which they played before most of the sovereigns of Germany. The little "Wolferl's" charming appearance and disposition endeared him to every one; and so innocent and natural were his manners that at Vienna he sprang upon the empress's lap and kissed her. The emperor Francis I. sat by his side while he played, and called him "the little magician." When he slipped one day on the polished floor the archduchess Marie Antoinette, afterwards queen of France, lifted him up, whereupon he said, "You are very kind; when I grow up I will marry you." Yet, in spite of the petting he received at court, he remained as gentle and docile as ever, and so amenable to parental authority that he used to say, "Next after God comes my father." In 1763 the whole family started again. Wolfer now sang, composed, and played on the harpsichord, the organ and the violin, winning golden opinions everywhere. At every court he visited he was loaded with caresses and presents; but the empresses were expensive, and the family terribly poor.

In Paris they lodged at the Bavarian embassy, giving performances on a grand scale both there and at Versailles, where Wolfer's organ-playing was even more admired than his performance on the harpsichord. Here, also, he published his first compositions—two sets of sonatas for the harpsichord and violin.

On the 19th of April 1764 Leopold Mozart brought his family to England, engaging a lodging in Cecil Court, St Martin's Lane, whence he afterwards removed to Pritch Street, Soho. On the 9th of April and the 19th of May Wolfer played before the royal family with immense success, accompanying the queen in a song and playing at sight anything that the king set before him. He now made his first attempt at the composition of a symphony; published a third set of sonatas, dedicated to the queen; and wrote an anthem for four voices entitled *God is our Refuge*, for presentation to the British Museum. On the 17th of September 1765 the family left England for the Hague, where they remained some time, and where in March 1766 the young composer made his first attempt at an oratorio, commanding in Holland a success as great as that he had already attained in London, and astonishing his hearers at Haarlem by performing on what was at that time the largest organ in the world. In September 1767 he paid a second visit to Vienna, and at the suggestion of the emperor Joseph II. composed an opera buffa, *La Finta semplice*, which, though acknowledged by the company for which it was written to be "an incomparable work," was suppressed by a miserable cabal. The archbishop of Salzburg hearing of this commanded a representation of the rejected work in his palace, and appointed the young composer his "maestro di capelli." The office, however, was merely an honorary one, and, since it did not involve compulsory residence, Leopold Mozart determined to complete his son's education in Italy, to which country he himself accompanied him in December 1769.

Wolfgang, now nearly fourteen years old, was already an accomplished musician, needing experience rather than instruction, and gaining it every day. At Milan he received a commission to write an opera for the following Christmas. Arriving in Rome on the Wednesday in Holy Week, he went at once to the Sistine Chapel to hear the celebrated *Miserecre* of Gregorio Allegri, which, on returning to his hotel, he wrote down from memory note for note—a feat which created an immense sensation, for at that time the singers were forbidden to transcribe the music on pain of excommunication. Returning to Rome towards the end of June, he was invested by the pope with the order of "The Golden Spur," of which he was made a cavalieri, an honour which he prized the more highly because, not many years before, it had been conferred upon Gluck. In July he paid a second visit to Bologna, where the Accademia Filarmonica, after subjecting him to a severe examination, admitted him to the rank of "compositore," notwithstanding a statute restricting this prerogative to candidates of at least twenty years old. The exercise which gained him this distinction is a four-part composition (Köchel's Catalogue, No. 86) in strict counterpoint on the antiphon *Quarele primam*, written in the serene ecclesiastical style of the 16th century and abounding in points of ingenious imitation and device.

1 In the baptismal register his name stands, *Joannes Chrysostomus Wolfgangus Theophilus* (Lat. *Amaeleus*, Ger. *Gottlieb*).
2 The German diminutive of Wolfgang.
3 The original autograph is numbered "Select Case C, 21. d."
4 Auraeae militiae eques.
In October 1770 Wolfgang and his father returned to Milan for the completion and production of the new opera. The libretto, entitled *Mitridate, Re di Ponto*, was furnished by an obscure poet from Turin, to the great disappointment of the young maestro, who was very anxious to produce Metastasio. The progress of the work was interrupted from time to time by the miserable intrigues which seem inseparable from the lyric stage, exacerbated in this particular case by the jealousy of the resident professors, who refused to believe either that an Italian opera could be written by a native of Germany, or that a boy of fourteen could manage the orchestra of La Scala, at that time the largest in Europe. Fortunately the detractors were effectually silenced at the first full rehearsal; and on the 26th of December Wolfgang took his seat at the harpsichord and directed his work amidst a storm of genuine applause. The success of the piece was unprecedented. It had a continuous run of twenty nights, and delighted even the most captious critics.

Wolfgang's triumph was now complete. After playing with his usual success in Turin, Verona, Venice, Padua and other Italian cities, he returned with his father to Salzburg in March 1771, commissioned to compose a grand dramatic serenata for the approaching marriage of the archduke Ferdinand, and an opera for La Scala, to be performed during the season of 1773. The wedding took place at Milan on the 21st of October; and the following March, in a brilliant revue, *Lei e lui*, the work was produced and repeated. That same month, he (at the suggestion of Hieronymus) was elected to the Academy of Sciences and Letters in Paris. He was aware of the public's interest in him, but he refused to be enticed away from his native city; and he was still determined to compose a work of which he could be proud. He was not content to languish in a provincial town, but determined to make his reputation in the great capital of Europe. In the meantime, his father had been commissioned to compose an opera for the Salzburg opera house, and the work was completed and performed on the 30th of April. The opera was a great success, and Wolfgang was hailed as a genius.

The news of his success reached Vienna, and the archbishop, Hieronymus, was pleased to hear that his young protégé had achieved such a success. He immediately wrote to the king of Prussia, stating that he had been commissioned to compose an opera for the court of Vienna, and that he was confident of its success. The king was delighted with the news, and immediately ordered Wolfgang to come to Vienna to conduct the performance of the opera. Wolfgang was overjoyed, and immediately set out for Vienna. He arrived on the 1st of July, and was immediately taken to the palace of the archbishop, where he was welcomed as a guest of honor. The archbishop had arranged for a special performance of the opera, and Wolfgang was delighted to see the crowd that had assembled to hear his music. He conducted the performance with great skill, and the opera was a tremendous success. The audience was delighted, and the archbishop was overjoyed with the result.

The next important event in Wolfgang's life was his appointment as maestro di capella at the court of Vienna. He was summoned to the palace by the archbishop, who had long been a admirer of his music. He was given the position of maestro di capella, and was immediately put in charge of the court orchestra. Wolfgang was overjoyed with the news, and immediately set about preparing the orchestra for the performance of the opera. He worked long hours, and was constantly occupied with the preparation of the orchestra. He was determined to make the performance a success, and worked hard to achieve this goal.

The performance took place on the 1st of August, and was a tremendous success. The audience was delighted, and the archbishop was overjoyed with the result. Wolfgang was hailed as a genius, and was immediately given the position of maestro di capella at the court of Vienna. He was immediately put in charge of the orchestra, and was determined to make the performance a success. He worked long hours, and was constantly occupied with the preparation of the orchestra. He was determined to make the performance a success, and worked hard to achieve this goal.

be done by jealous plotters to mar the composer's success was done, and that so effectively that Mozart declared he would never bring out another opera in the city which treated him so meekly. Fortunately, Figaro, like Die Entführung, was repeated with brilliant success in Prague. Mozart went there to hear it, and received a commission to write an opera for the next season with a fee of 100 ducats. Da Ponte furnished a libretto, entitled Tirso de Molina's tale, El Convidado de piedra, and entitled Il Don Giovanni. By the 28th of October 1787 the whole with the exception of the overture, not a note of which was written. This circumstance has led to the idea that it was ready in haste, but it is certain that Mozart knew it all by heart and transcribed it during the night from memory, while his wife told fairy tales to keep him awake.

The opera was produced on the 9th of October with extraordinary effect, and the overture, though played without rehearsal, was as successful as the rest of the music. Yet, when reproduced in Vienna, Don Giovanni pleased less than Salieri's comparatively worthless Tarare.

On returning to Vienna Mozart was appointed kapellmeister to the emperor, with a salary of 800 gulden (£80). In April 1789 he accompanied Prince Lichnowski to Berlin, where King Frederick William II. offered him the post of "kapellmeister" with a salary of 3000 thalers (£450). Though Mozart was unwilling to quit the emperor's service, he informed him of the offer and requested leave to resign his appointment in Vienna. "Are you going to desert me, then?" asked the emperor; and Mozart, wounded by the reproach, remained, to starve. The emperor now commissioned Mozart to compose another Italian opera, which was produced on the 26th of January 1790 under the title of Così fan tutte. Though the libretto by Da Ponte was too stupid for criticism, the music was delicious, and the opera would probably have had a long run but for the emperor's death on the 20th of February. In March 1791 Mozart consented to write a German opera, and entirely new plan for Schikaneder, it is the manager of the little theatre in the Weden suburb. The piece was to be addressed especially to the Freemasons, and to contain ceaseless allusions both in the words and music to the secrets of the brotherhood. Deeply interested in the affairs of a body of which he was himself a member, Mozart excelled himself in this new work, which took shape as Die Zauberflöte. He was rewarded for his labours by a brilliant artistic success, but Schikaneder alone reaped the financial benefit of the speculation.

Before the completion of Die Zauberflöte a stranger called on Mozart, desiring to quit the emperor's service, he informed him of the offer and requested leave to resign his appointment in the other world to forewarn him of his own approaching death. Meanwhile he received a commission to compose an opera, La Clemenza di Tito, for the coronation of the emperor Leopold II. at Prague. He worked incessantly and far beyond his strength. The coronation took place on the 6th of September, and its splendours threw the opera very much into the shade. Die Zauberflöte was produced on the 30th of September and had a splendid run. But the Requiem still remained unfinished; the stranger therefore made another appointment, paying a further sum in advance. Mozart worked at it unremittingly, hoping to make it his greatest work. In the Requiem he surpassed himself, but he was not permitted to finish it. When the stranger called the third time the composer was no more. The score of the Requiem was reverently completed by Süssmayer, whose task may have been simplified by instructions received from Mozart on his deathbed. It is now known that the work was commissioned by Count Walsegg, who wished to perform it as his own.

Mozart died on the 5th of December 1791, apparently from typhus fever, though he believed himself poisoned. His funeral was a disgrace to the court, the emperor, the public, society itself. On the afternoon of the 6th his body was hurried to a pauper's grave; and because it rained, Van Swieten, Süssmayer, and three other "friends" turned back and left him to be carried to his last long home alone. (W. S. R.)

Mozart's work falls conveniently into three periods, though O. John makes out, more accurately, five. Our first period may be said, in sober seriousness, to begin at the age of five and to merge into the second somewhere about the age of sixteen or seventeen. It was fortunate that the infancy of the sonata-forms (q.v.) coincided with the infancy of Mozart; for while this coincidence gave his earliest attempts a marvellous resemblance to the work of the fully-grown masters of the time, it secured for his mental activity a healthy and normal relation to the musical world which infant prodigies can never attain in a modern artistic environment. The little pieces composed by Mozart in his fifth and sixth years are a fascinating study in the unschooled progress made by a child who masters every step by some miraculous intuition that enables him to dispense with learning, but by a hardly less miraculous directness of thought that prevents him from either making the same mistake twice or exactly repeating a form once mastered. The violin sonatas written in London and Paris at the age of seven in no way fall below the accepted standards of the period, while they already show that variety of invention and experiment which, by the time he was twelve, caused some sober-minded critics to regard him as a dangerous person. His studies in the severer contrapuntal work gave him the greatest technical mastery of choral music attained since Bach; and more than one stray piece of church music, or movement from a mass or litany, written before he was fifteen, deserves to take rank as a true masterpiece of which the date is immaterial. At the age of fifteen we see a loss of freshness, especially in the numerous operas which show at its worst that hopeless condition of operatic art from which only Gluck's most drastic reforms could rescue it. Fortunately, Mozart had at fifteen acquired more than enough technical mastery to continue captivating his critics of the next generation. A series of operas, written in Prague, continued his success and burned his memory, even of those opera seria by which Mozart is

1 Michael Kelly, in his Reminiscences, has left a delightful account of the circumstances.
MOZART

known; and only a serious opera on a classical subject could furnish occasion for Gluck's phraseology and range of feeling to appear at all. How profoundly and independently Mozart seizes Gluck's method and style may best be seen by comparing the oracle scenes in Idomeneo and Alceste. In the management of the orchestra, however, Mozart has, as was to be expected, incomparably the advantage. He has all, or rather more than all, Gluck's power for portraying passion and managing, by the motion of his music, the flight of a crowd; but he also has an inexhaustible harmonic and contrapuntal invention which lay beyond Gluck's scope.

The problems of comic opera presented a far more fruitful field. In Die Entführung he speedily showed a dramatic grasp for which opera seria, in spite of all the influence of Gluck, gave him no scope. He had a wonderful feeling for character, and did not imagine, like many French and other disseminators of musical-dramatic ideas (including, in moments of weakness, even Gluck himself), that the expression of character in music was a mere matter of harping on special types of phrase. His melodic invention was clearly and subtly characteristic without mannerism. It is of hardly minor importance that his own literary sense was far higher than that of many a writer of ostensibly superior general culture; and that Osmin, the most living figure in Die Entführung, is Mozart's creation, words and all.

After Die Entführung, Mozart's record is a series of masterpieces. A noteworthy instance is his handling of a running commentary of pièces d'occasion. With rare exceptions, everything he writes illustrates the perfect solution of an art-problem, and he often achieves an artistic triumph with the most eccentric materials. The modern organist can find since Bach no grander piece in his repertory than the two fantasias which Mozart wrote for the harpsichord of a musical clock. Shortly before his death he wrote a beautiful adagio and rondo for the glass harmonica, to which he devised the curious but eminently natural accomplishment of flute, oboe, viola and violoncello. And when at an early age he was asked to devise something for a seminary in the interlude of a religious festival, he invented a concerto for two flutes, five trumpets and four drums, the result, although not artistically important, might well have seemed to indicate long experience in handling the combination. His work in the larger instrumental forms is further discussed in the articles Sonata Forms and Instrumentation. While Mozart's treatment of form has often been attacked as conventional, and his range of thought despised as childish, his instrumentation and general sense of euphony are at the present day more revered and admired by the most progressive propagandists than anything else in his production. Mozart's later operas, from Figaro onwards, represent the nearest approach to a perfect art-form attainable in pre-Wagnerian opera. What he might have attained in serious opera had he been spared to see the solemn triumphs the French operatic stage realized in the austere sincerity of Cherubini and Méhul it is impossible to guess. But we cannot doubt that a Mozart of yet riper experience than we have known would have given tragic opera a history in which Fidelio did not stand in lonely splendour. For Mozart, however, serious opera was an Italian art-form, only temporarily rescued from the tyranny of bravura singers by Gluck. After Idomeneo he handled it only once, at the very close of his career, and then, as if to seal its fate, in a pièce d'occasion with an impossibly dull and unsympathetic libretto (La Clemenza di Tito). For comedy, however, his harmonic and rhythmic range was perfectly adapted; and in Figaro he had the advantage of a libretto which was already a finished literary product of consummate stagecraft before it ever became an opera. The perpetual surprises of its absurdly complex intrigues impose no real strain, for no one attempts to follow them; but they keep every character on the stage in a state of excitement, which is so heightened and diversified by the music that, while Beaumarchais's Mariage de Figaro has its modest but definite place in literature, Mozart's Figaro is, with all its lightness of touch, one of the most ideal classics in all art. The subject is not edifying; but Mozart does not analyse it from that point of view. His characters are irresponsible, mischievous and fairy-like. Theirs is the world described by Lamb—"the Utopia of gallantry, where pleasure is duty and the manners perfect freedom."

In Don Giovanni the matter is less clear. Mozart rose, not only to the music of the ghostly statue, but also in the music of Donna Anna and Donna Elvira, to heights that can only be called sublime; yet he never lost sight of the true methods of that comedy of gallantry to which Don Giovanni stands in some sense as a grotesque tragic finale. It is the business of an artistic intellect to grasp the artistic possibility of a world in which the "Utopia of gallantry" is at war with a full-blooded and incipiently moral humanity until the critical moment determines, not the breaking up of the artistic unity, but the right conclusion of the story. If it is absurd to treat Donna Anna and Donna Elvira as Wagnerian heroines, and so to complaisantly render the inadequacy and conventionality of much of their utterances and attitudes; so, also, is it no less absurd to regard them as "secretly rather gratified than otherwise to be on Don Giovanni's list." Donna Elvira has suffered more cruelly from stolidly tragic singers and no less stolidly flipant critics than she ever suffered from Don Giovanni himself. She comes upon the stage expressing herself in thoroughly conventional music, and we are told that the formulas of Italian opera are inadequate for the expression of her sorrows. Look at the sfondo in the second violins at the words Ah far rivisto l'empire. Mozart is depicting a young girl facing a position she does not in the least understand; expressing herself in stereotyped phrases as much from inexperience of their meaning as from lack of anything that may better say what she really feels. What Mozart's music with exquisite humour and simplicity expresses is as yet nothing more serious than the wish to scratch Don Giovanni's eyes out; as soon as his character is revealed to her in Leporello's comic aria of the "catalogue," she determines that others at all events shall not suffer as she has suffered; and from that moment her character steadily develops in seriousness and dignity. She is not all strength, and Don Giovanni is not all weakness; but the libretto is not sufficiently realized, on hints of which the librettist was hardly conscious, a consistent scheme of development as dramatic as it is in keeping with the most sublime possibilities of comic opera. Yet it is a common practice to insert Elvira's last confession of weakness, the aria Mi tradi, immediately after Leporello's catalogue aria! Perhaps the first place where an intelligent tradition of Mozart as a comic genius of the highest type has been restored is Munich, where the standard set under the conductorship of Richard Strauss will not soon be forgotten.

As Don Giovanni, Mozart struggles with an absurd libretto show even clearer evidence of the accuracy and power of his genius than when he is working under conditions where success is possible. Space forbids our dwelling further on this subject, nor can we do more than glance at his last great opera, Die Zauberflöte. Beethoven thought it his greatest work; for the simple literal-minded sincerity with which Beethoven regarded the question of operatic libreto made Figaro frivolous and Don Giovanni scandalous in his sight. Mozart's very serious interest in freemasonry, which in its solemn ritual furnished an edifying contrast to the frivolity and uncongeniality of the existing state of church music, inspired him with the most sublime ideas hitherto brought upon the operatic stage. He was further stimulated by the feeling that freemasonry was to some extent a persecuted institution; and the circumstance that his librettist was a skilful stage manager secured for him that variety of action and effectiveness of entry and exit, compared with which an intelligible plot is of almost negligible importance as a source of inspiration to the classical composer, or even as a means of retaining popular favour. Thus Die Zauberflöte is an achievement unique in opera; combining as it does the farcical gorgeousness of a pantomime with the solemnity of a ritual and the contemporary interest of a political satire.

From the solemnity of masonic ritual there is but one step to that most pathetic of unfinished monuments, Mozart's Requiem. The finished portions of this work contain the most sublime and perfect church music between Bach and the Missa solemnis of
MOZDOK—MTSENSK

Beethoven. The unauthentic portions, supplied by Süssmayer, are so well disguised that even their comparative slightness of material hardly militates against the suspicion that he himself had some inkling of Mozart's Intentions. In particular, the return of the first number at the words Lux aeterna, which enables Süssmayer to end with ten pages of authentic Mozart, is splendidly placed (though Mozart is reported to have contemplated an independent final number); while the latter part of the Lacrimosa, though not in Mozart's handwriting, must surely have been dictated by him. The instrumentation of the incomplete numbers is based for the most part on highly authentic evidence, although there are doubtful points; but in view of the supplied numbers, especially the four Benedicite, is far below the intellectual level of their design. In this, his last work, as in many wonderful polyphonic experiments immediately before it, Mozart showed unmistakable signs of the growth of a new style, which would undoubtedly have had an influence even more powerful on the history of music as being embodied in works surpassing his ripest known achievements as these surpass the marvellous productions of his childhood. Nevertheless, what he has given us is unique, and the intelligent love of Mozart's work is a liberal education in the meaning of art.

Mozart's extant works (as catalogued by Köchel in 626 items, beginning with minuets written at the age of four and ending with the Requiem) comprise 20 masses (including the Requiem and the great C minor), 13 symphonies, 104 sonatas (including 29 of vespers music), 80 smaller Latin pieces of church music; 6 cantatas and oratorio works, of which the greatest, Davide penitente, is adapted from the Mass in C major; 6 non-piano sonatas (including a sonata for organ and an organ-and-choir work for use in church); 23 operas (including fragments and operettas); 66 arias and other pieces for insertion into operas or for concert use; 41 songs with piano accompaniment; 29 canons (mostly polyphonic); violoncello sonatas; 5 fantasies, and a Handelian suite (unfinished); 22 smaller pianoforte pieces; 36 cadenzas to his own piano forte concertos; 11 works for piano forte & quatuor majeurs; 45 sonatas, including fragments and variations, for one or two pianos; 5 piano concertos; 2 piano trios; 1 quintet for piano and flute; 2 duets for violin and viola; 2 string trios; 19 string quartets; 2 quartets for flute and strings; 1 quartet for cello and strings; 9 string quintets, of which 1 is for the singular combination of 1 violin, 2 violas, violoncello and horn, and another is the famous clarinet quintet; 49 symphonies; 33 cadenzas, serenades and divertimentos, many for the orchestra or solo combinations; 27 smaller orchestral, and other pieces, also often for strange combinations of surprising beauty; 29 sets of orchestral dances; 6 violin concertos (the 6th is either quite spurious or extremely corrupt) and 4 single violin movements; 2 duos for cello and violin (for violin and viola); 10 concertos and concert pieces for various wind instruments (flute, horn, bassoon, clarinet, flute and harp); 27 piano concertos; 2 trios (most of them unaccompanied); 1 piano concerto for piano and violin, and a very large string quartet movement in A (probably a finale), which breaks off at an exciting moment at the beginning of its development.

No composer's reputation has suffered more from forgeries and false attributions than Mozart's and the tale begun during the lifetime of his widow is not yet at an end. The concertante for 4 wind instruments which recently went triumphantly round the orchestral societies of Europe as a long-lost work written during Mozart's visit to Paris (though it is not for the same instruments) is not so bad as the notorious forged masses, but it is all, as far as one can judge with Mozart's definitive versions, and it was written at any period of his career, almost as obviously spurious. Mozart often wrote without thought, but never, even when he was six years old, without mastery; and there is nothing genuine which he is as dull as this concerto that is so obviously constructed by a fool.

A panegyric of the concertante has been inserted in the latest (posthumous) editions of Jahn's biography, which is very difficult to reconcile with the scholar's general estimate of Mozart.

On the other hand, twelve recently discovered divertimenti for 2 clarinets and bassoon are delightful little works which, with all their slightness, only Mozart, and Mozart in full maturity, could have written. These are a whole suite of divertimenti to a poem of September 1907, and, though inferior to the earlier ones, are undoubtedly genuine, every detail and quality of its organization being exactly in keeping with the other allegro divertimenti of the kind.

Mozart's genuine works are known in spurious forms; thus the motet Splendidissima est Maria is an unauthorized arrangement of a chorus from König Thomas, and most of the flute-music mentioned in the article Flute in Grove's Dictionary (new ed.) consists of spurious arrangements, while several important genuine works have been ignored.

MOZDOK, a town of Russia, in Caucasus, and in the province of Terek, on the left bank of the river Terek, 605 ft. above sea-level, in 43° 41' N. and 44° 39' E., 50 m. N. of Vladikavkaz. The population, 8760 in 1861, numbered 14,983 in 1897, and consisted of Kabardians, Chechens, Ossetes, Georgians and Armenians. Built in 1763 by the prince of Kabardia, Mozdok became an important point in the Russian advance towards the Caucasus, and was fortified. In 1840 it was attacked by the Circassian patriot Shamyl and 5000 mountaineers. The melons and water-melons of Mozdok are widely famed; and vine-growing and silkworm breeding prosper.

MOZLEY, JAMES BOWLING (1813-1878), English theologian, was born at Gainborough, Lincolnshire, on the 15th of September 1813, and was educated at Oriel College, Oxford. He was elected to a fellowship at Magdalen in 1840. He took an active part in the Oxford movement, but could not any more follow Newman into the Roman communion "than fly." He was joint editor of the Christian Remembrancer, but withdrew from the position because of his substantial agreement with the famous Gothic decision. He was one of the earliest supporters of the Guardian. In 1856 he became vicar of Shoreham, in 1869 canon of Worcester, and in 1871 regius professor of divinity at Oxford. He died at Shoreham on the 4th of January 1878.

He wrote A Treatise on the Augustinian Doctrine of Predestination (1855); The Primitive Doctrine of Baptismal Regeneration (1856); and The Financial Principles of the Christian Remembrancer (1862); Subscriptions (1863); Lectures on Miracles, being the Bampton Lectures for 1865; and Ruling Ideas in Early Ages and their relation to the Old Testament Faith (1877). Essays, Historical and Theological, appeared in 1878 (2 vols.), with a preface by a biographical sketch by his sister Anne, who also edited some of his Letters (1884).

MOZLEY, THOMAS (1806-1893), English divine and writer, was born at Gainborough in 1806, the son of a bookseller and publisher in that town. From Charterhouse school he proceeded to Oriel College, Oxford, where he became the pupil, and subsequently the intimate friend, of John Henry Newman. In 1831 he was ordained, and became, in 1836, rector of Cholmerton, Wiltshire. He was, from its beginning, a strong supporter of the Tractarian movement, and after contributing for some time to the British Critic, he withdrew from the movement, succeeded Newman as editor in 1841. In 1848 he was at the point of joining the Roman Catholic Church. Newman, however, strongly advised him to take two years to reflect, and long before that period had elapsed Mozley had determined to remain an Anglican. In 1844 he began to write leading articles for The Times, and continued to do so regularly for many years. In 1847 he resigned his country living and settled in London, but in 1868 accepted the living of Plymtree, Devonshire. From 1876-1890 he was rural dean of Ottery St Mary's, Devon. He resigned his living in 1880, and removed to Cheltenham, where he died on the 17th of June 1893.

He was the author of Reminiscences, chiefly of Oriel, and the Oxford Movement, published in 1882.

MPONGWE (Mpongo), a settled Bantu people of the Gabun, West Africa, constantly confused with the Mpongwe or Fang (q.v.). The Mpongo, who call themselves Ayogo or "the Wise," have a rich collection of national songs, myths and traditions, and the tribal elders know the "Hidden Words," a kind of secret language of unknown origin. Their language, a Bantu dialect, has been the means of communication between the tribes of the Bantu and the Europeans. The family organization is intricate and very similar to the Roman patria potestas; wives, children and slaves being all subservient to the father, who alone is really free. They practise the poison ordeal, and reverence vague and malignant spirits who require propitiation by offerings and ceremonies. The ghosts of the dead are especially feared.

MTSENSK (popularly Ancmenisk), a town of Russia, in the government of Orel, on the navigable Zusha River, 17 m. from its confluence with the Oka, and on the Moscow & Kursk railway, 32 m. N.E. of the city of Orel. Pop. (1900), 6390. It is
mentioned in the Russian chronicles as early as 1147. From 1350 to 1530 it was under the rule of Lithuania; in the latter year it was taken by Russia, and became one of her chief strongholds against the raids. There was a picturesque half-timbered guild hall (1589). Trade is mainly agricultural, but there are limequarry quarries in the neighbourhood. Wenlock received the grant of a market from Henry III. in 1224. It was incorporated by Edward IV. in 1448, when it also received the privilege of returning members to parliament, but in 1885 it ceased to have separate representation.

MUCIANUS, LICINIUS, Roman general and statesman, lived during the 1st century A.D. His name shows that he had passed by adoption from the Mucian to the Licinian gens. About A.D. 55 he was sent by Claudius, who had become suspicious of his intimacy with Messallina, to Armenia with Domitius Corbulo. Under Nero he regained the imperial favour. After the death of Galba (69), Mucianus and Vespasian (who was at the time in Judaea) both swore allegiance to Otho, but when the civil war broke out Mucianus persuaded Vespasian to take up arms against Vitellius, who had seized the throne. It was agreed that Vespasian should stay behind to settle affairs in the East, while Mucianus made his way through Asia Minor and Thrace to attack Vitellius. He reached Rome the day after the death of Vitellius, and found Domitian, Vespasian's son, at the head of affairs, but until the arrival of Vespasian the real master of Rome was Mucianus. But he never wavered in his allegiance to Vespasian, whose favour he retained in spite of his arrogance. As no mention is made of Mucianus during the reigns of Titus or Domitian, he probably died during the reign of Vespasian. He was a clever writer and historian. He made a collection of the speeches and letters of the Romans of the older republican period, probably including a corpus of proceedings of the senate (Acta senatus), and was the author of a work, chiefly dealing with the natural history of the East, which is often quoted by Pliny as an authority, especially for fabulous statements.

See monograph by L. Brun (Leipzig, 1870).

MUSIC ACID, C₆H₄O₄ or HOOC-(CHOH)₅-COOH, is obtained by the oxidation of milk, sugar, dulcete, galactose, quercetin and most varieties of gum by nitric acid. It forms a crystalline powder which melts at 213°C. It is insoluble in alcohol, and nearly insoluble in cold water. When heated with pyridine to 140°C, it is converted into allomucic acid. When digested with fuming hydrochloric acid for some time it is converted into ad-u furanure dicarboxylic acid (see FURURANE); while on heating with barium sulphide it is transformed into ω-thiophene carboxylic acid (see Thioascetic Acid). The acid is made by dry distillation carbon dioxide, ammonia, pyrrol and other substances. The acid when fused with caustic alkalies yields oxalic acid.

MUCILAGE (from Late Lat. mucilago, a mizzly juice, from mucere, to be mizzly), a term which denotes a viscid or glutinous mixture of water and any gummy vegetable substance (see Gum). Mucilages are useful in medicine as vehicles for various insoluble and other drugs, and in the arts as thickeners (in calico-printing, dyeing, etc.). The British pharmacopoeia contains the mucilages of the red and transforming poplar.

MUCKERS (Ger. Muckern, i.e. canting bigots, hypocrites), the nickname given to the followers of the teaching of Johann Heinrich Schönherr (1770-1826) and Johann Wilhelm Ebel (1784-1851). Schönherr, the son of a non-commissioned officer at Memel in Prussia, was educated at the university of Königsberg, where at that time the theological faculty, under the influence of Kantian idealism, was strongly rationalist in tendency. The lad, who was miserably poor, was dissatisfied with a philosophy which stopped short of an explanation of the "thing in itself," and, having been reared in the strictest orthodoxy, he set to work to break it up, and, while teaching in a village school, he set up on his own. In the end he believed himself to have reached ultimate knowledge, and became the prophet of a dualistic theosophy so closely analogous to Gnosticism that it might have been taken for a deliberate revival, had not Schönherr's lack of education precluded any such idea. Among his converts was Ebel, who from 1810 onwards gained a great reputation in Königsberg as an earnest preacher of the orthodox doctrines of sin, grace and redemption, and in 1816 was appointed "archdeacon, i.e. principal pastor, at the old church in Königsberg. In the pulpit he was orthodox; but when gathered about him a select circle of initiates, to whom in private he taught Schönherr's doctrines. Schönherr himself sank into the background, and eventually died in 1826. But Ebel continued his teaching, and was joined in 1827 by Heinrich Dietzel, also a Lutheran pastor of Königsberg. They became father confessors to a wide circle of silly fashionable people in the Prussian capital. In view of their peculiar teaching as to the "purification of the flesh," which involved the minute regulation of the intercourse of married people, scandal was inevitable. Schönherr distinguished two primal powers or principles—one male and active, the other female and passive—having both person-ality and volition: he called them Light and Darkness, Fire and Water. They moved freely in the world and from the ultimate contact God and the world spring into being. Evil came into existence owing to the fall of Lucifer, a Light-being created by God, who in revenge lent his aid to the powers of Darkness. Sin came with the Fall of Man; and this infection, inherited with the blood, necessitated redemption in order to restore the harmony of the primal powers. This was the work of Christ, who descended into a world of inhuman beings of which are divided into children of Light and children of Darkness. The love of the Son of God, emanating from Christ, perfects the higher natures in whom Christ's "law of righteousness" is represented and who to a certain extent share in his being; it becomes their duty to obtain control over the lower natures so as to struggle against the powers of Darkness in them—powers which can be overcome by prayer, fasting and self-mortification generally. The end was near and the triumph of the Light approaching. Anti-christ has already appeared, and when Christ came he would find no faith on the earth (Luke xviii. 8) because faith would be swallowed up in knowledge.
MUCUNA - MUFTI

MUFFLING, FRIEDRICH KARL FERDINAND, FREIHERR von, called WEISS (1775-1851), Prussian general field marshal, was born on the 12th of June 1775, and entered the Prussian army in 1790. He contributed to a military dictionary edited by Lieutenants W. von Leibnitz. Between the years of 1802-1803, being then a subaltern, he was appointed to the newly-formed general staff as "quartermaster-lieutenant." He had already done survey work, and was now charged with survey duties under the astronomer F. X. von Zach (1754-1832). In 1805, when in view of a war with France the army was placed on a war footing, Müffling was promoted captain and assigned to the general staffs, successively, of General von Wartensleben, Prince Hohenlohe and Glütlrich. In 1806 he served under Hohenlohe, then under Saxen-Weimar, and was included in the capitulation of the latter's corps at Hanau. Afterwards he entered the civil service of the duke of Weimar. He rejoined the army on the outbreak of the War of Liberation in 1813, and was placed on the headquarters staff of the army of Silesia. His business qualities and common sense were greatly valued, though the temperamental differences between Müffling and Gneisenau often led to friction, especially as the former was in a measure the representative of the antiquated "topographical" school of strategists, to whom (rightly in the main) the disaster of Jena was attributed. Müffling entered the wars during occupation of Paris and the Hundred Days, Müffling served as chief of the staff to the Russian general Barclay de Tolly and to General Kleist von Nollendorf. He was Prussian commissioner at the duke of Wellington's headquarters in the Waterloo campaign, and was involved in the various controversies which centred round the events of the 16th of June 1815. After the final fall of Napoleon he served on the staff of the army of occupation in France and was for some months military governor of Paris. He spent part of his time, the Rhine in survey work, and was employed by Frederick William III. in various diplomatic missions. In 1821 he became chief of the general staff at Berlin, and though he has been accused of indulging his taste for topographical work at the expense of training for war, his work was not wasted, for he gave an excellent organization to the general staff, and executed elaborate and useful surveys. In 1829 he visited Constantinople and St Petersburg in connexion with negotiations for peace between Russia and Turkey. He took a prominent part in the military and civil history of Prussia, and from 1836-1847 was governor of Berlin. Failing health compelled his retirement in the latter year, and he died on the 16th of January 1851, at his estate of Ringhofen near Berlin.

Under the initials of C(arl) von (Weisse), he wrote various important works on military art and history: Operationsplan der preuss.-sächs. Armee 1806 (Weimar, 1807); marginalia on the archduke Charles's Grüne Bücherei; and the history of the Armee, and on Rühle von Lilienstern's Bericht über die Vorgänge bei der Hohenlohearmee 1806; Die preussisch-russische Kampagne bis zum Waffenstillstand 1813-1814 (Berlin, 1813); Geschichten der Armeen unter Wellington und Blücher 1815 (Stuttgart, 1817); Zur Kriegsgesch. der Jahre 1813-1814; die Pflastäde der schlesiischen Armee von der Beendigung des Waffenstillstandes bis zur Eroberung von Paris (Berlin, 1822); Betrachtungen über die grossen Operationen und Schlachten 1813-1815 (Berlin, 1825); Napoleon's Strategie 1813 (Berlin, 1827); and an essay on the Roman roads on the lower Rhine (Berlin, 1834). Müffling was also the inventor of a system of hierarchic formations. His reminiscences, Aus meinem Leben, were published at Berlin in 1851.

MUFTI 1, a consulting lawyer in Islam, who, upon application, gives fatvas (fatwas) or legal opinions on points of canon law (see MAHMOMMEDAN LAW). These are asked and given in strictly impersonal form, but the cadi, or judge, then applies them to the case and decides in accordance with them. In theory, any learned man whose opinion is respected and whose advice is sought can give fatwas. But generally in a Muslim state the fatwas are in the hands of the government, one for each school of canon law in each place. Each of these renders opinions in accordance with the law-books of his school;

2 The use of the word for plain or civilian clothes worn instead of uniform is originally Anglo-Indian. It may have been suggested by the loose flowing robes of the stage "muff," and thus implied any easy dress worn by an officer when out of uniform.

inevitable. Matters came to a head in 1835, when Count Finckenstein, himself formerly an initiate, denounced the two pastors and accused them of immorality. Dietzel wrote two violent tirades against the count, who brought an action for slander and won it. The evidence taken in the case was then laid before the consistory, and proceedings followed which became famous as the "Königsberger Religionsprozess" (1835-1841), ending in sentences of deprivation on both Ebel and Dietzel. The charges of actual immorality were dismissed; but there is no doubt that some of their followers established practices akin to those of the Agapemone and the Perfectionists. Some of them migrated to Brazil, where in 1854 at Porto Alegre a company of their pupils were established with a total membership of 3,000. See J. I. Mombert, Faith Victorious (London, 1882); Heyworth Dixon, Spiritual Woes (1868); and, more especially, the article on Schönheit, by P. Schackert, in Herzog-Hauck, Realencyclopaedie (3rd. ed., Leipzig, 1900), vol. 676.

MUCANA, a genus of twining plants, belonging to the natural order Leguminosae, and natives of the tropics. M. pruriens is popularly known as cowhage or cowitch, a corruption of the Hindu Kiwach. It is a tall annual climber with large dark purple pea-like flowers, and golden-brown velvety pods recalling those of the sweet pea, the hairs or bristles on which often raise blisters on the skin. It is common in the tropical regions of India, Africa and America, and the hairs on the pod have long been used in medicine as a vermicide.

MUDANIA (anc. Apamea Myriake), a town of Asia Minor, on the south coast of the Sea of Marmora, and the port of Brusa. It is connected with Brusa by a railway and a carriage road, and with Constantinople by steamers. Olive oil is produced. Pop., 5900, of which two-thirds are Greeks.

MUDHOL, a native state in the southern division of Bombay. Area, 368 sq. m.; pop. (1901), 63,007; revenue, 20,000. It was a Maharatta principality dating from Mahomedan rule before the rise of the British. The family name of the chief is Gharopade. The town of Mudhol stands on the left bank of the Ghatprabha; pop. (1901), 8359.

MUDIE, CHARLES EDWARD (1818-1890), English publisher and founder of Mudie's Lending Library, was born at Chelsea on the 18th of October 1818, the son of a secondhand bookseller and newsagent. In 1840 he established a stationery and book-selling business in Bloomsbury, London. He was the first publisher of James Russell Lowell's poems in England, and of Emerson's Man Thinking. In 1842 he began to lend books. This, he announced at the close of his annual report in 1859, "Select Library" to larger premises in New Oxford Street, London. In 1866 these premises were substantially enlarged, and branches of the business established, and in 1864 "Mudie's" was converted into a limited company. Mudie himself died on the 28th of October 1890.

MUFF, an article of outdoor apparel, open at either end, for holding the hands in and keeping them warm, generally made of fur, but also of velvet, silk, &c. Muffs are now only used in England by women, but in the 17th and 18th centuries were fashionable for men. In Roman times the place of the glove was taken by long sleeves (manoeci) reaching to the hand, and in winter special sleeves of fur were worn (cf. Cic. Phil. ii. 11, 26). In Medieval Latin we find the word muffsæ, defined by Du Cange (Gloss., s.v.) as chirotheca pelitæ ad hibernæ. He quotes from a cartulary of the year 817, of the issuing to monks of sheepskin coverings to be used during the winter. These may have been, as the Roman certainly were, separate coverings for each hand, although the cartulary cited also distinguishes the glove for summer from the muculæ for winter wear. The O. Fr. moufe meant a thick glove or mitten, and from this the Du. mof, Walfors and English mouf. These are probably derived from the Fr. mousse have come the various uses, verbal and substantival, of "muff," viz. to wrap round for protection, for deadening sound &c., and for a chamber or receptacle in a furnace to protect objects from contact with fire while exposed to heat. The slang use of "muff" for a clumsy, awkward person is of late origin. It appears in the middle of the 19th century.

1 The contemptuous designation Mukern dates from this time.
MUGGLETON—MUHLENBERG, J. P. G.

he has no scope for free interpretation; everything is fixed there, and he must follow the precedents of the elders. In Turkey there is a chief mutiq, called the Sheikh al-Islam, whose office was created by the Ottoman sultan, Mohammed II., in 1453, after the capture of Constantinople. He is, in a sense, the head of the ecclesiastical side of the state, that controlled by canon law; while the grand vizier is at the head of secular matters. Although his powers are delegated by the sultan-caliph, and he is appointed and can be dismissed by him, yet in his fatwâ-issuing power he is independent. The sultan may dismiss him before he has a chance to issue a fatwâ; but if he issues it the result is legally automatic, even though it means the deposition of the sultan himself. Thus it was by a fatwâ of the Sheikh al-Islam that Mustafa al-Naqi, vizier under Mohammed V., was removed.

See Juywoll, De moehammedasche Wet, 40 seq.; De Sane's trans. of Ibn Khaldun's Proslogimenes, I. xxxvii. 447 seq.; Turkey in Europe, by "Odysses", 131 seq.; Young, Corps de droit ottoman, I. x., 285, 289. (D. B. MA.)

MUGGLETON, LODOWICKE (1669-1668), English sectarian, was born in Bishopsgate Street, London. His father was a farrier, but he himself was bred to be a tailor. In 1651 he began to have revelations, and to proclaim himself and his cousin John Reeve, whose journeyman he was, as the two witnesses mentioned in Rev. xi. 3. In 1652 they put out their "commission book" under the title The Transcendent Spiritual Treatise. An exposition of their doctrines was published in 1656 under the title Of the Divine Looking-Glass. Among other views (besides the doctrine of the divine mission of the authors) this work taught that the distinction of the three persons in the Trinity is merely nominal, that God has a real human body, and that He left Elijah as His viceroy in heaven when He Himself descended to die on the cross. Muggleton's opinions gained some notable adherents, but also called forth much opposition. In 1653 he was imprisoned for blasphemy, and twice (1660 and 1670) his own followers temporarily repudiated him. His attack on the Quakers drew forth William Penn's book, The New Witnesses proved old Heretics (1672). In 1677 Muggleton was tried at the Old Bailey, convicted of blasphemy, and fined £500. Reeve died in 1678, but Muggleton survived till 1698.

He collected works, including the posthumous Acts of the Witnesses, were published in 1756; and in 1832 some sixty Muggletonians subscribed to bring out a new edition of The Works of J. Reeve and L. Muggleton (in 3 vols. 4to). Even as late as 1846 The Divine Looking-Glass was represented in the then almost extinct sect. See A. Jessopp, The Coming of the Friers (1888).

MUGWUMP, in American political slang, a name applied to any independent voter, and especially to those independents in the Republican party who refused to support James G. Blaine, when nominated by that party for the presidency in 1884; as since adopted in England it usually means one who stays neutral and votes for no party. Originally "mugwump" (mogkioemp) was a North American Indian word, in the Massachuset dialect of the Algonquian, meaning "great man" (mogki; great; ump, man) and in New England it was used of self-sected politicians.

MUHAMRAH (Muhamrah), a town of Persia, in the province of Arabistan, in 30° 26′ N., 48° 11′ E., on the Hafar canal, which joins the Karun with the Shatt el Arab, and flows into the latter 40 m. above its mouth at Fao and about 20 m. below Basra. It has post and telegraph offices, and a population of about 5000. With the opening of the Karun river, as far as Ahvaz, to international navigation in 1886, Muhamrah acquired greater importance, and its customs, which until then were leased to the governor for 30,000 a year, rose considerably, and paid £8,000 until taken over by the central government of the Independent Turkish republic in 1902. It is estimated that the value of the imports and exports into and from Muhamrah, excluding specie, is about £500,000 per annum, paying customs amounting to about £18,000. Until 1847, when it definitely became Persian territory in accordance with art. ii. of the treaty of Erzerum, Muhamrah was alternately claimed and occupied by Persia and Turkey, its ruler, an Arab sheik, helping either power as he found it convenient. Since then the governor of the town and adjoining district has been a sheikh of the Kâb or Chaab Arabs, a powerful tribe of the Shi'ah branch of Islam. At the close of the Anglo-Persian campaign in 1857 Muhamrah was taken by a British force under Major-General Sir Robert Hamilton-Watson.

MÜHLENBERG, a town of Germany, in Prussian Saxony, on the left bank of the Elbe, 8 m. below Riesa. Pop. (1895), 3380. It carries on a considerable trade by water in timber and corn. Mühlberg is famous for the victory gained here, on the 24th of April 1547, by the emperor Charles V. over the electors of Saxony, John Frederick.

See Lenz, Die Schlacht bei Mühlberg (Gotha, 1879); and Bertram, Chronik der Stadt Mühlberg (Torgau, 1864).

MUHLENBERG, HENRY MELCHIOR (1711-1789), German-American Lutheran clergyman, was born in Einbeck, Hanover, about the 6th of September 1711. When he was twelve years old his father, a member of the city council, died. The son entered the university of Göttingen in 1733, and he then went to the poor of Göttingen led to the establishment of the present orphan house there. In 1738 he went to Halle to finish his theological studies; he was a devoted worker in the Franckesche Stiftung, which later served as a partial model for his great-grandson's community at St Johnland, Long Island. He was deacon at Grossenhennersdorf, in Upper Lusatia, in 1739-1741. In 1742, in reply to a call from the Lutheran churches of Pennsylvania, he went to Philadelphia, and was joined from time to time, especially in 1745, by tenants from Halle. Mühlberg occupied himself more particularly with the congregation at New Providence (now Trappe), though he was practically overseer of all the Lutheran churches from New York to Maryland. In 1748 he organized the first Lutheran synod in America. Mühlberg married in 1745 Anna Maria Weiser, daughter of J. Conrad Weiser, a well-known Indian interpreter, and herself said to have had Indian blood in her veins; by her he had eleven children. Throughout the War of Independence he and his sons (see below) were prominent patriots. He died at Trappe on the 7th of October 1787. The importance of his work in organizing and building up the American Lutheran Church, of which he was called the Patriarch, can hardly be exaggerated; but his example in promoting the English as well as in German was, unfortunately for the growth of the Lutheran Church, not followed by his immediate successors. He had no sympathy with the Old Lutherans and their strict orthodoxy—on the contrary he was friendly with the Reformed congregations, and with George Whitefield and the Tennents. See Life and Timer by William J. Mann (Philadelphia, 1889).

MUHLENBERG, JOHN PETER GABRIEL (1746-1807), American preacher and soldier, son of H. M. Muhlenberg (q.v.), was born at Trappe, Pennsylvania, on the 1st of October 1746. With his two brothers he was educated in Germany. He entered the Lutheran ministry, had charge of churches at New German-town and Bedminster, New Jersey, and after 1772 of a church in Woodstock, Virginia, and there in 1775 raised the 8th Virginia (German) regiment, of which he was made colonel; in February 1777 he became a brigadier-general in the Continental Army; and in September 1783 was breveted major-general. He took part in the battles of Brandywine, Germantown and Monmouth, and at Yorktown commanded the first brigade of light infantry. After the war he removed to Pennsylvania. He was a member of the Virginia convention of 1776; was vice-president of the supreme-executive council of Pennsylvania in 1787-1788, and was a representative in Congress in 1780-1791, in 1793-1795, and in 1790-1801. In 1801 he was elected as a Democratic-Republican to the United States Senate, but immediately resigned to become supervisor of revenue for the district of Pennsylvania. He became collector of the port of Philadelphia in 1803. He was a friend of Thomas Jefferson and of James Monroe. See Life by Henry A. Muhlenburg (Philadelphia, 1849).

His brother, FREDERICK AUGUSTUS CONRAD MUHLENBERG (1750-1801), became his father's assistant in Philadelphia in 1770; was pastor of the Christ (or Swamp) German Lutheran Church of New York City from 1773 to 1776; and in 1777-1779 was assistant to his father at New Hanover. In 1779-1780 he was
MUIR, W. A.—MUHLENBERG, W. A.

a member of the Continental Congress, in 1760–1763 of the Pennsylvania general assembly (then consisting of only one house), and in 1769–1770 of the state constitutional convention. In 1774 he was president of the Pennsylvania convention which ratified the federal constitution, and was a member in 1789–1797 of the national House of Representatives, of which he was speaker in 1789–1791 and 1793–1795. On the 20th of April 1796, as chairman of the committee of the whole, he cast the deciding vote for the laws necessary to carry out Jay’s treaty.

Another brother, GOTTIFLE HENRY EUSTE MUIRBERG (1753–1813), was a prominent Lutheran clergyman, and was pastor of a church in Lancaster, Pennsylvania, from 1779 to his death; but he is best known as a historian and publisher. Pennsylvania plantarum Americanae septentrionalis (1813) and Descriptio superiori graminum et plantarum calamariarum Americanae septentrionalis indignarum et circumn (1817).

See John M. Mäisch, G. H. E. Muhlenberg als Botaniker (1886). Gottthil’s son, HENRY AUGUSTUS MUILENBERG (1782–1844), was pastor of a Lutheran Church in Reading, Pennsylvania, in 1802–1828, was a Democratic representative in Congress in 1829–1838, and was United States minister to Austria in 1838–1840.

Mühlhausen, William Augustum (1750–1829), an American philanthropist and Protestant Episcopal clergyman, great-grandson of H. M. Muhlenberg and grandson of F. A. C. Muhlenberg, was born in Philadelphia, Pennsylvania, on the 16th of September 1796. He graduated at the university of Pennsylvania in 1815. In 1817 he was ordained a deacon in the Protestant Episcopal Church, and became assistant to Bishop William White (1748–1836) in the rectorship of Christ Church, St. Peter’s and St James’s, Philadelphia. In 1820 he was ordained priest and until 1826 was rector of St. James’s Church, Lancaster, Pennsylvania. Large owing to balls, Lancaster was the second public school district created in the state. His interest in church music and hymnody prompted his pamphlet of 1821, A Plea for Christian Hymns; he drew up for the use of his own parish a collection of Church Poetry (1823); and in 1823 he was appointed by the General Convention a member of the committee on psalms and hymns, whose collection, approved in 1826, contained several of Muhlenberg’s own compositions, including “I would not live alway,” “Shout the glad tidings,” and “Saviour, who thy flock art feeding.” From 1826 to 1845 he was rector of St George’s, Flushing, Long Island, where in 1827 he became head of the first Protestant Episcopal “church school” in the United States. He founded a St Paul’s College, to include the institute, but the panic of 1837 and the refusal of a charter by the state legislature brought it to an end; and the property was sold a few years after Muhlenberg left Flushing. The methods of this institute were however copied widely; church schools sprung up everywhere; and St Paul’s School, Concord, New Hampshire, and the Groton School in Massachusetts were established in accordance with his ideas. In 1845 he removed to New York City, where in 1846 he became rector of the Church of the Holy Communion, a “free church” built by his sister, Mrs Mary A. Rogers. Here Muhlenberg founded the first American order of Protestant Episcopal deaconesses, the Sisterhood of the Church of the Holy Communion, begun in 1845 and formally organized in 1852. The work of the sisterhood led to Muhlenberg’s establishment of St Luke’s Hospital (opened in 1858), for which his congregation made offerings each St Luke’s Day after 1846. In 1866 he founded on Long Island the Church Industrial Community of St Johnland. He bought 535 acres (mostly wooded), with a shore front of 13 m on Long Island Sound, near King’s Highway, L.I., for the use of the hospital, and for young children, especially cripples.1 The plan was not reformatory nor purely charitable, and a moderate rent was charged for the cottages. In the St Johnland cemetery is the grave of Dr Muhlenberg, who died on the 8th of April 1877 in St Luke’s Hospital, New York City. His ideal of the hospital was that it was missionary and evangelical as well as catholic and with formal services; hence he called himself an “evangelical Catholic” and wrote the Evangelical Church Papers, which were collected and published by Anne Ayres in 1875–1877.

See Anne Ayres, Life and Work of William Augustus Muhlenberg (New York, 1880), and W. W. Newton, Dr Muhlenberg (Boston, 1890), in the “American Religious Leaders” series.

Mühlhausen, a town of Germany, in Prussian Thuringia, on the right bank of the Unstrut, 23 m. N.W. of Gotha by rail. Pop. (1905), 34,350. It consists of a new and an old town, surrounded by five suburbs, and has numerous old churches and towers. The most interesting churches are those of St Mary and of St Blasius, dating respectively from the 14th and the 12th century; the town-hall is also a fine medieval structure. The chief industries are the spinning and weaving of woolen and cotton. Other manufactures include needles, machinery, cigars, soap, hosiery, furniture and shoes. There are also establishments for dyeing, tanning, lime-burning, iron-making, brewing and the preparation of liqueurs.

Mühlhausen is one of the oldest towns in Thuringia, and is said to have been fortified in 925. Its early importance is shown by the grant of privileges made to it by the German King Henry I., and by the diet held here in 1135. During the Reformation period Mühlhausen became notorious as one of the chief seats of the Anabaptists. Thomas Münzer, one of their leaders, was captured in the vicinity and executed in the town. Internal dissensions and injuries received during the Thirty Years’ War and the Seven Years’ War afterwards reduced Mühlhausen to unimportance. In 1802 it lost its independence and passed to Prussia, in 1807 it was attached to the kingdom of Westphalia, but in 1813 it again became Prussian. The Teutonic Order established itself at Mühlhausen in 1200.

See E. Heydenreich, Aus der Geschichte der Reichsstadt Mühlhausen (Halle, 1900); Nebesiek, Reformationsgeschichte der Stadt Mühlhausen (Magdeburg, 1905); Herquet, Urkundenbuch der ehemaligen freien Reichsstadt Mühlhausen (Halle, 1874); F. Stephan, Verfassungsgeschichte der Reichsstadt Mühlhausen (Sondershausen, 1886); Jordan, Chronik der Stadt Mühlhausen (Mühlhausen, 1900–1906); and Führer durch Mühlhausen und Umgebung (1901).

Muir, John (1810–1882), Scottish Orientalist, was born on the 5th of February 1810 in Glasgow, where his father, William Muir (d. 1821), was a merchant. He was educated at the grammar school of Irvine, the university of Glasgow, and the East India Company’s College at Haileybury. He went to India in 1832, and served in various offices, as assistant secretary to the board of revenue, Allahabad, and assistant master at Azimgarh, as principal of the Victoria College, Benares, and as civil and session judge at Fatehpur. He encouraged the study of Sanskrit, and furthered schemes for the enlightenment and amelioration of the Hindus. In 1853 he retired and settled in Edinburgh, where he continued his Indian labours. In 1862 he endowed the chair of Sanskrit in the university of Edinburgh, and was the main agent in founding the Shaw fellowship in moral philosophy. He was a D.C.L. of Oxford, L.L.D. of Edinburgh, and was one of the first to receive the distinction of C.I.E. He died on the 7th of May 1882.

In 1858 appeared vol. i. of his Original Sanskrit Texts (2nd ed., 1868), it was on the origin of caste, an inquiry intended to show that it did not exist in the Vedic age. Vol. ii. (1st ed., 1860; 2nd, 1871) was connected with the Ahimsa and tika movements, and inspiration held both by the Vedic and later Indian writers. Vol. iv. (1st ed., 1862; 2nd, 1873) was a comparison of the Vedic with the later representations of the principal Indian deities, an exhibition of Indian views by which the Vedic hymns became the deities of the former Hindu Trimurti. Vol. v. (1870) was on the Vedic mythology. Dr Muir was also the author of a collection of anonymous work on Inspiration, several works in Sanskrit, and many essays in the Journal of the Royal Asiatic Society and elsewhere.
MUIR, SIR W.—MULBERRY

MUIR, SIR WILLIAM (1819-1905), Scottish Orientalist, brother of the preceding, was born at Glasgow on the 27th of April 1819. He was educated at Kilmarnock, where he graduated at Glasgow and Edinburgh Universities, and at Haileybury College, and in 1837 entered the Bengal Civil Service. He served as secretary to the governor of the North-West Provinces, and as a member of the Agna revenue board, and during the Mutiny he was in charge of the intelligence department there. In 1865 he was made foreign secretary to the Indian Government. In 1867 he was knighted (K.C.S.I.), and in 1868 he became lieutenant-governor of the North-West Provinces. In 1874 he was appointed financial member of the Council, and retired in 1876, when he became a member of the Council of India. Mukden had always captured his interest in educational matters, and it was chiefly through his exertions that the central college at Alhambad, known as Muir’s College, was built and endowed. In 1885 he was elected principal of Edinburgh University in succession to Sir Alexander Grant, and held the post till 1903, when he retired. Sir William Muir was a profound Arabic scholar, and made a careful study of the history of the time of Mahomet and the early caliphate. His chief books are a Life of Mahomet and History of Islam in the Era of the Hegira; Annals of the Early Caliphate; The Caliphate; translated by Mr. J. G. Lorimer, which brought to a close the fall of the caliphate on the onset of the Mongols; The Koran: its Composition and Teaching; and The Mohammedan Controversy, a reprint of five essays published at intervals between 1885 and 1887. In 1881 he delivered the Rede lecture at Cambridge on The Early Caliphate and Rise of Islam. He married in 1840 Elizabeth Huntly, Wemyss (d. 1897), and had five sons and six daughters; four of his sons served in India, and one of them, Colonel A. N. Muir (d. 1899), was acting resident in Nepal.

MUĞADDASI [the appellation of Shams ad Din Abu Abdullah Mohammed ibn Ahmad (c. 967-1008), Arabian traveller, author of a Description of the Lands of Islam which is the most original and among the most important of Arabic geographies of the middle ages. His family name was Al Bashari. His paternal grandfather was an architect who constructed many public works in Palestine, especially at Acre, and his mother’s family was opulent. His maternal grandfather, a man of artistic and literary tastes, migrated to Jerusalem from Jurjan province in Persia, near the frontier of Khorasan. His descriptions rest on extensive travels through a long series of years. His first pilgrimage to Mecca was at the age of twenty in (A.H. 356 = A.D. 1007), but his book was not published till A.D. 375 (A.D. 985-986), when he was forty years old. The two MSS. (at Berlin and Constantinople) represent a later recension (A.H. 375). The book became known in Europe through the translation of several chapters by William of Rubruck, and by an English version obtained by the Jesuits. It was edited by T. J. de Goede as the third part of his Bibliotheca Geographorum Arabiscorum (Leiden, 1877). See also the English translation (unfinished) by G. S. A. Rankin and R. F. Azoo, in Bibliotheca Indica, New Series, Nos. 890, 952, 1901 (Bengal Asiatic Society, 1897-1901); Muğaddasi’s Syrian chapter has been separately translated and edited in English by Gay le Strange (London, Pales- nine Pilgrims Text Society, 1886); in German by J. Gildemeister in Zeitschrift des deutschen Palastina-Vereins, vol. vii. (1884).

MUKDEN (Chinese Shëngkimg), the capital of Manchuria, on the Hun-ho, 110 m. N.E. of Niuchwang, in 45° 51' N., 125° 38' E., with a population of 250,000. It is a centre for trade and also for missionary enterprise. It was formerly the headquarters of the Manchu dynasty, and their tombs lie within its confines. Mukden is a fine town, with splendid walls, about a mile long each way. The suburbs extend a considerable distance from the city and are surrounded by mud walls. In the centre of the town stands a small palace surrounded by an inner wall and roofed with yellow tiles. The book and palace of Nurhachu, the founder of the present Chinese dynasty, who was a pedlar, are preserved there. Nurhachu’s son, the emperor T’ien-tsung (1627-1656), built temples to heaven and earth in the neighbourhood of the city in imitation of those at Peking. These are much dilapidated. Four or five miles to the east of the town stands the Fu-ling or “happy tomb,” where the remains of Nurhachu rest, the outer gates of which are adorned with a green majolica representation of an imperial dragon. The Emperor K’ien lung (1726-1796) wrote a poem on his tomb, which was translated into French by Pére Amiot and attracted the attention of Voltaire. During the Russo-Japanese War in 1905 some of the heaviest fighting took place before Mukden, what is known as the “battle of Mukden” covering operations from the 10th of February till the Japanese occupied Mukden on the 10th of March and the Russians retreated northward on the 12th.

MUKDISHU (Magodoxo), a seaport of Italian Somaliland, East Africa, in 2° 1' N., 45° 24' E. It is built on the sandy coast which separates the Wadi Shebeli from the sea. The harbour consists of Mukdishu, a former extensive harbour, which consists of two villages, Hamarwin to the south and Shingani to the north. There are some houses in the Moorish style and a mosque among the ruins bears date 636 A.H. (i.e. A.D. 1238). Between the two settlements is the governor’s palace and north of the town is a massive square tower built by the Portuguese in the 16th century. The population, about 5000, is mainly composed of descendants of negro slaves known as Abesh. There are also Somali, Arab and Hindu settlers. Mukdishu is mentioned by Marco Polo and described by Ibn Batuta as an “immense foam and sea” and was in ancient times a flourishing port and had many fine mosques when captured by the Portuguese (about 1530). Under Portugal the place fell into decay. It passed in the 17th century into the possession of the imams of Muscat, but in the 18th century became practically independent. It was reconquered by Seyyid Said c. 1830, and on the division of his dominions fell to Zanzibar. In 1802 it was transferred to Italy (see SомалlaD, Italian). The name of the town is spelt in a great variety of ways, including Madeigascar, whence the name of the island of Madagascar. Alfred Granddidier points out that the Portuguese, misled by Marco Polo’s description of Mukdishu as an island, fancied they had discovered the land of which he wrote when they touched at Madagascar.

MULA, a town of eastern Spain, in the province of Murcia; on the left bank of the Mula, a small right-hand tributary of the Segura, periodically liable to destructive floods. Pop. (1900), 12,731. The Sierra Espuña rises on the south to a height of nearly 5200 ft. Mula has a small trade in agricultural produce, wine and olive oil. About 4 m. east are two groups of houses known as the Baños de Mula, with warm sulphurous springs of considerable local repute.

MULBERRY (botanically Morus; nat. ord. Moraceae), a genus of about ten species growing in the temperate regions of the northern hemisphere and in the mountains of the tropics. They are deciduous trees or shrubs with alternate, toothed, often three-lobed leaves and unisexual flowers in catkin-like inflorescences. The black mulberry (Morus nigra), a native of western Asia, spread westwards in cultivation at an early period; it was cultivated by the Greeks and Romans, and in northern Europe by the 9th and 10th centuries. Up to the 15th century it was extensively grown in Italy for rearing silkworms, but has since been superseded by M. alba. It is now mainly cultivated for its oblong purplish-black compound fruit—the so-called sorosis, formed from the whole female inflorescence in which the perianth leaves of the single flowers have become fleshy—which is wholesome and palatable if eaten fresh before acetous fermentation has set in. The mulberry succeeds as a standard in the warmer parts of England, especially in standard situations, but in the north of England and the less favoured parts of Scotland it requires the assistance of a wall. The standard trees require no other pruning or training than an occasional thinning out of the branches, and are generally planted on lawns, to prevent the fruit being damaged when it falls. 1 Mulberry stands for morrbury or marryberr, i.e. morus and “berry,” cf. Ger. Maulbeere, O.H.G. mullberi, mûliberi.
falls. The tree succeeds best in a rich, deep, and somewhat moist loam, but grows well in any good garden ground. It is usually propagated either by cuttings or layers, which latter, if made from the older branches of the tree, come sooner into bearing. Cuttings planted in the spring should consist of well-ripened shoots of the preceding year, with a joint of two-year-old wood at their base, or if planted in autumn should have the shoots well matured, and furnished with a heel of two-year-old wood. The branches and even stout limbs are sometimes employed as cuttings instead of the younger shoots, especially when the object is to obtain a bearing tree quickly.

**Mulde—Mule**

959

Freiberg, Döbeln, and Leisnig. The united river flows north to Grimma and thence past Wurzen, Eilenburg and Bitterfeld to Deutz, where it joins the Elbe. The total length of the united river is 75 m.

**Mule (Lat. mulus),** a term not unfrequently applied to the produce of any two creatures of different species, and synonomious with hybrid, but in its ordinary application employed to designate the offspring or “cross” between the equine and asinine species. There are two kinds of mule—the Mule proper (Equus asinus, var. γ; Mulus; Fr. Mulet or Grand mulet; Ger. Groser Maulesel), which is the hybrid produce of a male ass with a mare, and the Hunny (Equus asinus, var. b; Hinnaus; Fr. Bardot or Petit mulet; Ger. Kleiner Maulesel), the offspring of the stallion and female ass. The mule is the more valuable of the two, and to its production the attention of breeders is entirely directed.

In its short thick head, long ears, thin limbs, small narrow hoofs, short mane, absence of chestsnuts (horney growths) inside the hocks, and tail destitute of hair at the root the mule is asinine; while in height and body, shape of neck and croup, uniformity of coat, and in teeth it is equine. It has the voice neither of the ass nor of the horse, but emits a feeble hoarse noise. The most common colour of the mule is a brown or bay-brown—bay, or bright bay, or piebald being rare; a chestnut tint is sometimes noticed. It possesses the sobriety, patience, endurance and sure-footedness of the ass, and the vigour, strength and courage of the horse. As a beast of burden it is preferable to the horse, being less impatient under the pressure of heavy weights, while the skin being harder and less sensitive renders it more capable of resisting sun and rain.

The mule has been in use from early times; the inhabitants of Mysia and Paphlagonia are said to have been the first breeders. With the Greeks and Romans, the latter especially, the mule was valued, being employed to draw carriages and carry loads. In modern times it has been largely used for military transport.

The principal mule countries in Europe are the south of France, Spain, Portugal and Italy, where they are used for pack and draught. The French mules are most numerous on the borders of the Pyrenees, in Gascony, and in Poitou. In Spain mules are used in the Catalan provinces, in the mountainous districts of Andalusia, and in the province of Alicante. Good draught-mules are bred in La Mancha and in the districts on the slopes of the Pyrenees, where they are employed to carry loads. But in Spain, Italy, and some other countries they are also extensively used in carriages; in Spain particularly, where large, fine mules are bred for this purpose, a pair of these animals will often cost more than a pair of horses. The mules of Asia Minor, Syria, Cyprus, Egypt and Algeria, as well as those of the district between the Tigris and the Persian frontier and in North China, are good. In the Punjab provinces of British India many excellent mules are bred, breeding being promoted by the government. Good mules are reared in North and South America, the principal districts for breeding them in the United States being Texas, Missouri, Mississippi; Tennessee, Alabama, Georgia, Arkansas and Kentucky. The Kentucky mules are well shaped and showy, being derived from nearly thoroughbred mares known as Kentucky trotters, while those reared in Missouri are hardy. The Mexican mule, bred by a mule ass out of a mustang mare, is also a hardy, strong and useful animal.

France is perhaps the most important mule-raising country in Europe, four centres being more particularly devoted to this kind of industry: Poitou, the mountainous districts of central France, the Pyrenees and Dauphiné. The mules of these different parts differ chiefly in height; those of Poitou are large, powerful, and long in the body, and are mainly exported to the departments of Languedoc and Provence, as well as to Spain, Italy and America; those of Dauphiné are of medium height, with a short, thick body; while those of the centre and the Pyrenees are lighter and smaller, but more active.

Mule-breeding in Poitou is supposed to date from the time of Philip V. of Spain, when the particular breeds of horses and

**Mulberry (Morus nigra)** Shoot bearing Fruit.

2. A male flower.

The branch should be planted deeply in autumn in good soil, and if necessary supported in an upright position by a stake. The most common mode of propagation, however, is by layering the young branches. The mulberry may be grown in pots, and gently forwarded in an orchard house, and under these conditions the fruit acquires a richness of flavour unknown in the fruit ripened out of doors. If cultivated in this way it requires abundance of water while the fruit is swelling, and also frequent dressings of artificial fertilizers.

The white mulberry (M. alba), so called from its nearly white fruit, is the one mainly employed in sericulture. It is a native of China and has been cultivated from the earliest times in Asia and since the 10th century in Europe, especially in the Mediterranean region. There are many varieties, among which the Philippine mulberry (var. multicaulis) is perhaps most highly esteemed. The Indian species, M. indica (not to be confounded with Morinda citrifolia, a rubiaceous tree, sometimes also called Indian mulberry), is also cultivated for the same purpose.

M. rubra, the North American red mulberry, is the largest of the genus, often reaching a height of 70 ft. It produces dark red berries much inferior in flavour, however, to those of M. nigra.

Broussonetia papyrifera, a member of a closely allied genus, is the paper mulberry, a native of Burma, China and Polynesia, and widely cultivated in Japan, where the bark is used for paper-making. The Tapalo-cloth of the South Sea Islands is also made from it. The plant is a shrub or small tree with large mulberry-like lobed or entire hairy leaves. Several forms are cultivated, differing chiefly in the shape of the leaves.
asses were imported into that region and Gascony. But there is
evidence to show that as early as the 10th century the mules
of Potou were of excellent quality.

MULGRAVE, EARLDOM OF, a title dating from 1626, when
Edmund Sheffield, 3rd Baron Sheffield of Butterwicke, was
created earl of Mulgrave. He was succeeded by his grandson
Edmund, the 2nd earl, who was one of the nine true peers who
sat in Oliver Cromwell's House of Lords. Edmund's son John,
3rd earl, was created marquess of Normanby in 1694, and duke
of Buckingham and Normanby in 1703; but on the death of his
son, the 2nd duke, without heirs in 1735, the title, with the
estates of the Sheffield family to his mother Catherine, a natural
daughter of James II., who had married as her first husband the 3rd earl of Annesley, by whom
she had a daughter Catherine, who married William Phipps
and had a son Constantine Phipps. The latter succeeded to the
estate of Mulgrave in Yorkshire in 1743 on the death of his
grandmother, and in 1767 he was created Baron Mulgrave of
New Ross in the peerage of Ireland. His son was created a
peer of Great Britain in 1790 with the title of Baron Mulgrave
of Mulgrave; and the latter's brother Henry, that year, succeeded
in a whole series of state and official affairs in 1805 and
held other high government offices, was created Viscount
Normanby and earl of Mulgrave in 1812. The 2nd earl of this
creation, who like his father held several high cabinet offices,
was advanced in the peerage at the coronation of Queen Victoria,
being created marquess of Normanby in 1838.

MÜLHAUSEN (Fr. Mulhouse), a town of Germany, in Upper
Alsace, on the Ill, an affluent of the Rhine, and the Rhine-
Rhone canal, about 56 m. S. of Strasbourg and 21 m. N.W.
of Basel by rail. The old town, surrounded by arms of the Ill,
having narrow and irregular streets, while to the north, on the canal,
lie the handsome villas and promenades of the new town. Most
of the older buildings have made way for factories, so that the
town-hall, dating from 1555, is an almost solitary witness to
the town's medieval prosperity. The most important interest
of Mühlhausen centres in the making of cotton goods. This
industry was introduced in 1746, and has since prospered in
the hands of several wealthy families which are closely connected
by intermarriage, and lend each other support. A large pro-
portion of the inhabitants of the town and the neighbourhood
is engaged in wooden and other textile manufactures, the
products of which are exported to almost all parts of the world.

The manufactures of machinery, especially locomotives and railway
plant, chemicals, and hardware are also important. A note-
worthy feature is the attention paid by the manufacturers to
the well-being of their workpeople. In 1853, Johann Heinrich
Dollfus (1800-1887), mayor of the town, founded the "artisans'
town" (cité ouvrière) to the north-east of the old town, consisting
of about 1200 model dwellings with public bath, wash- and
bake-houses, and library. The houses were let on a system by
which the occupant became the owner after the payment of a certain
number of instalments. Of recent years, however, on the opera-
tives have moved into the suburbs, leaving the model houses
of the "artisans' town" to small tradesmen. A "société indu-
strielle" for the encouragement of original discovery and invention
among the workmen has existed since 1825, and there are various
beneficial societies. Mühlhausen carries on an active trade
in grain, wine, colonial produce and timber, which is facilitated
by its river harbour. After the annexation of Alsace to Germany
in 1871 the French sympathies of the inhabitants were shown
by the extraordinary decrease in their number. The population
has since increased, amounting in 1905 to 94,514, of whom
about two-thirds are Roman Catholics. Mühlhausen

Mentioned as early as 717, Mühlhausen was raised to the rank
of a free town of the empire in 1108, and received very extensive
privileges from Rudolph of Hapsburg in 1273. It suffered
considerably in the various wars of the middle ages, but generally
managed to maintain its independence. In 1466 it formed an
alliance with the Swiss, and this became a permanent union in
1515. By the peace of Westphalia (1648) it was recognized
as an independent ally of the Swiss League. In 1797 it sought
incorporation with France from motives of commercial policy,
and in 1871 it passed to Germany.

See A. Metzger, La République de Mulhouse 1717-1798 (Basel, 1884);
Schall, Das Arbeitsleben von Mühlhausen (Berlin, 1877); Herkner,
Die obder-daissische Baumwollindustrie und ihre Arbeiter (Strassburg,
1883); and E. Tourner, Mühlhausen im 16. Jahrhundi (Illuy, 1894).

MÜLHEIM-AM-RHEIN, a town of Germany, in the Prussian
Rhine province, on the right bank of the Rhine, 2 m. below
Cologne, of which it is practically a suburb, and on the main
lines of railway Cologne-Düsseldorf and Cologne-Koln. There
are several industries, including the manufacture of silk
ribbons, velvet, sailcloth, tobacco, vinegar, yarn and chemicals,
in addition to rolling-mills, boiler works, telegraph works,
breweries, tanneries, and a ship-building yard. Mühlheim also
carries on a brisk trade by river and river.

Of ancient foundation, Mühlheim received municipal rights
in 1322. Its industrial prosperity is in great part due to
the influx of Protestants expelled from Cologne at the beginning
of the 17th century. In 1784 the town suffered severely from
an inundation caused by the rapid breaking-up of the ice on the
Upper Rhine.

MÜLHEIM-AN-DER-RUHR, a town of Germany, in the Prussian
province of Ruhr, an affluent of the Rhine, about 7 m. W. from Essen and at the intersection of several
railways. Pop. (1905), 93,508. It has a pariah church dating
from the 12th century. Like most of the towns in this district,
Mühlheim finds its chief industry in iron-working, and contains
numerous blast-furnaces, rolling-mills, foundries and engine-
works; it also carries on manufactures of leather, wool, cotton,
calico, tobacco, paper, beer, and other miscellaneous goods.
An enormous traffic, by river and rail, is carried on in coal, and
there is also a considerable trade in timber and colonial produce.
In the neighbourhood are important sandstone quarries, glass-
works, and a carpet manufacture. Mühlheim was formerly
included in the duchy of Berg, and became a town in 1568. In
1875 it passed to Prussia.

MULJI, KURSENDAS (1832-1879), Indian journalist
and social reformer, was born on the 25th of July 1832, of a family
belonging to the Bhatia or trading caste of western India. Being
repudiated by his family on account of his views on widow
remarriage, he became a vernacular schoolmaster, and started
a weekly paper in Gujarati called The Satya Prakash. In
this he attacked the immorality of the Maharajas or hereditary
high priests of the Vallabhacharya sect of Vaishnavism to which
the Bhatias belong. In a suit for libel brought against him in
the High Court at Bombay in 1862, he won a victory on the
main issue. After a visit to England on business in connexion
with the cotton trade, which was not successful and brought on
him excommunication from his caste, he was appointed in 1874
to administer a native state in Kathiawar during the minority
of the chief; and there he died in August 1875.

See History of the Sect of Maharajas or Vallabhacharyas of Western India.

MULL, the largest island of the Inner Hebrides, Argyllshire,
Scotland. Pop. (1901), 4,334. It is bounded on the W. and S.
by the Atlantic, on the N. and N.E. by the Sound of Mull, and
on the E. and S.E. by the Firth of Lorne. It has an area of
about 367 sq. m., its greatest length being 27 m. and its greatest
breadth 20 m. The coast is much indented, the principal sea-
lochs being Loch Mingary, Loch Cuan, Loch Tu, Loch-na-Keal,
Loch Scridain, Loch Buy, Loch Spelve and Loch Don. Among
several fresh-water lakes Loch Frisa, Loch Ba and Loch Uisg
are the chief. The principal mountains are Ben More (3,185 ft.),
Ben Buy (2,354 ft.) and Ben Cresh (2,809 ft.). In the Hebridean
cliffs near Carasaig are numerous arches and caverns. The
prevailing rocks are gneissose rocks, chiefly gabbro in the
mountains in the south-east, granite in the Ross. The valleys
are filled up with lava flows and volcanic ashes of Miocene age.
At a few places there are gneissose rocks, chalk, sandstone,
lias and quartz porphyry. Sheep and cattle are raised, and
barley, oats and potatoes grown. Owing to the damp climate
the island is better suited for grazing than for cultivation.
Grainite and freestone are quarried. Ben More deer forest and the excellent fishing and shooting attract many sportmen. There are several ancient castles, the principal being those of Duart and Aros. Close to the former is a lighthouse erected in memory of William Black, the novelist (d. 1858). About midway between Mull and Lismore is the Lady Rock, visible at low water, on which, in 1523, Lachlan Maclean of Duart exposed himself, as a symbol of his submission to the second earl of Argyll, expressing that she would be drowned by the flowing tide. She was, however, saved by her clansfolk and her husband was afterwards slain by her brother. Joanna Baillie (1762-1831) made the incident the leading theme of her drama of The Family Legend, Tobermory ("the Well of Mary," so called from a spring of local celebrity) is the only town (pop. 1172). It is placed on a pretty bay, the houses standing on tree-clad heights. It was founded in 1788 as a station for fishing-boats, and the herring fishery is still of some consequence. It has regular communication by steamer with Stornoway, Oban and Glasgow. Off the north-western shore of Mull, separated by a narrow strait, lies the isle of Ulva, 4½ m. long and 2¾ m. broad, whose inhabitants are mostly engaged in fishing and kelp-gathering. Close to Ulva, and practically one with it at low tide, is the isle of Gometra, about 1½ m. long and 2 m. broad, the people of which are chiefly occupied with fishing. Little Colonsay lies about 2 m. south of Ulva. Farther west is the small group of the Treshnish Islands.

Mull—Müller, G.

Mull, Mull—Müller, G.

Mull—Müller, G. 961

Graphic naturalist, he joined the expedition sent out under Augustus Gregory by the duke of Newcastle, secretary of state for the colonies. He explored the river Victoria and other portions of North Australia, was one of the four who reached Termination Lake in 1856, and accompanied Gregory's expedition overland to Moreton Bay. From 1857 to 1873 he was director of the Botanical Gardens, Melbourne, and not only introduced many species of Victoria, but also described the excellent qualities of the blue gum tree (Eucalyptus globulus) known all over the world, and succeeded in introducing it into the south of Europe, North and South Africa, California, and the extra-tropical portions of South America. For these services he was decorated by many foreign countries, including France, Spain, Denmark and Portugal; was created K.C.M.G. in 1879, baron of the kingdom of Württemberg in 1871, and F.R.S. in 1881. He published eleven volumes of Fragmenta physiographica Australiae (1862-1881), two volumes of the Plants of Victoria (1860-1865), and other books on the Eucalyptus, Myopaceae, Acacias, Salsolaceae, all profusely illustrated. He also co-operated in the production of G. Bentham's Flora Australiensis. He took a leading part in promoting Australian exploration, especially the Burke and Wills expedition, which was the first to cross the continent, and in the various attempts to unravel the mystery which attended the fate of his fellow-countryman Ludwig Leichhardt (1813-1848). He died at Mullgbourne on the 9th of October 1866.

Müller, Friedrich (1749-1807), German poet, dramatist and painter, usually known as Maler (i.e. painter) Müller, was born at Kreuznach on the 13th of January 1749. He studied painting at Zweibrücken, and in 1774-1775 settled in Mannheim, where in 1777 he was appointed court painter. In 1778 he was enabled by a public subscription to visit Italy, which remained his home for the rest of his life. In 1780 he became a Roman Catholic. He was unfavourably influenced by the study of Italian models, and gradually gave up painting and devoted himself to the study of the history of art; his services as critic were especially in demand among German visitors to Rome. Before he left Mannheim he had tried his hand at literature, under the influence of the Sturm und Drang movement. A lyric drama, Niobe (1778), attracted little attention; but Fausts Leben dramatisiert (1778) appealed to the turbulent spirit of the time, and Golo und Genoveva (begun in 1776, but not published till 1811) was an excellent imitation of Goethe's Götz von Berlichingen. He struck out a more independent path in his idylls, notably Die Schaßschar (1775) and Das Nusskern (1811), in which, emancipating himself from the influence of Goethe, he reproduced scenes without a touch of satire—from the German peasant-life of his day. He died at Rome on the 23rd of April 1825.

Maler Müller's Werke appeared in 3 vols. (1811-1825); in 1868 H. Hettner published two volumes of Dichtungen von Maler Müller, which contain most of his writings. Gedichte von Maler Friedrich Müller; Eine Nachleß zu dessen Werken appeared in 1873, and his Fausts Leben was reprinted by B. Seiffert in 1881. See A. Sauery, "Stürmer und Dränger," vol. iii. (Korschner's Deutsche Nationalliteratur, vol. 81, 1883); and B. Seiffert, Maler Müller (1877).

Müller, George (1825-1868). English preacher and polemicist, was born at Halifax, Yorkshire, on the 27th of September 1825, the son of an exciseman. He subsequently became a naturalized British subject. Educated in Germany, he resolved in 1826 to devote himself to missionary work, and in 1828 went to London to prepare for an appointment offered him by the Society for promoting Christianity among the Jews. In 1830 however he gave up the idea of missionary work, and became minister of a small congregation at Teignmouth, Devonshire. He contended that the temporal as well as the spiritual needs of life could be supplied by prayer, and on this account George new presented refused to take a fixed salary. After two years at Teignmouth, Müller removed to Bristol, where he spent the rest of his life. He devoted himself particularly to the care of orphan children. He began by taking a few under his charge, but in course of time their number increased to 2000, settled in large houses erected for the
MÜLLER, J. P.—MÜLLER, J.

purpose at Ashley Down, near Bristol. The money required for the carrying on of this work was voluntarily contributed, mainly as a result of the wide circulation of Müller's narrative The Lord's Dealings with George Müller. When he was over seventy he started on a preaching mission, which lasted nearly seventeen years and included America, Europe, India, Australia and China. He died at Bristol on the 10th of March 1858.

See A. T. Pierson, George Müller of Bristol (1899).

MÜLLER, JOHANNES PETER (1801–1858), German physiologist and comparative anatomist, was born at Coblenz on the 14th of July 1801. In 1810 he entered Bonn University, where he became privatdocent in 1824, extraordinary professor of physiology in 1827, and successor to Professor Schaffhausen in 1833. In 1833 he removed to the university of Berlin, where he filled the chair of anatomy and physiology with great distinction until his death on the 28th of April 1858. Müller made numerous researches in various departments of physiology, and in particular he extended knowledge as to the mechanism of voice, speech and hearing, and as to the chemical and physical properties of lymph, chyle and blood. The appearance of his Handbuch der Physiologie des Menschen between 1833 and 1840 (translated into English by Dr. William Baly, and published in London in 1842) marked the beginning of a new period in the study of physiology. In it, for the first time, the results of human and comparative anatomy, as well as of chemistry and other departments of physical science, were brought to bear on the investigation of physiological problems. The most important portion of the work was that dealing with nervous action and the mechanism of the senses. Here he stated the principle, not before recognized, that the kind of sensation following stimulation of a sensory nerve does not depend on the mode of stimulation but upon the nature of the sense-organ. Thus light, pressure, or mechanical stimulation in the retina and the optic nerve invariably produces luminous impressions. This he termed the law of the specific energy of sense substances. In the later part of his life he chiefly devoted himself to comparative anatomy. fishes and marine invertebrata were his favourite subjects. Müller numbered such distinguished physiologists as H. von Helmholtz, E. Du Bois Reymond and K. F. W. Ludwig among his pupils.

In addition to his Handbuch der Physiologie, his publications include: Zur vergleichenden Physiologie der Geschlechtsorgane des Manes und der Tiere (1826); Über die phantasistischen Gesichterscheinungen (1826); Bildungslehre der Genitalien (1830), in which he traced the development of the Müllerian duct; De glandulis seminiferis structura (1830); Vergleichende Anatomie der Myxoiden (1833–1843); Systematische Beschreibung der Plagiostomen (1841) with F. G. J. Henle; System der Asteriden (1842) with F. H. Troschel; and Horae ichthyologicae (1848). After his death, F. Melch (1781–1833) edited the Archiv für Anatomie und Physiologie.

MÜLLER, JOHANNES VON (1752–1809), Swiss historian, was born on the 3rd of January 1752 at Neunkirch, near Schaffhausen, where his father was pastor. In 1760 the family removed to Schaffhausen. In his youth his maternal grandfather, Schoop (d. 1757), roused in him an interest in the history of his country. At the age of eight he is said to have written a history of Schaffhausen, and at eleven he knew the names and dates of all the kings of the four great monarchies. His ardour for historical studies was further stimulated by Schlozer, when Müller went (1760) to the university of Göttingen, nominally to study theology. In July 1771 he undertook a sketch of Swiss history (no detailed history of Switzerland having so far been written) for a publisher of Halle, but his theological studies and the preparation of a Latin dissertation on the Bolium cimbricum (publ. in 1772) prevented much progress. In April 1772 he passed his theological examination, and soon after became professor of Greek at the Collegium Humanitatis. Early in 1774, on the advice of his friend Charles Victor de Bonnette, he gave up this post and became tutor in the Tronchin family at Geneva. But in 1775 he resigned this position also, and passed his time with various friends in Geneva and Vaud, engaged in carrying his historical scheme into effect. Having accumulated much material, he began the actual composition of his work in the spring of 1776, and the printing in the summer of 1777. But difficulties arose with the censor, and matters came to a standstill. In 1778–1779 Müller delivered a brilliant set of lectures on general history, which were not published till 1789 under the title of Vierundzweihundert Bücher allgemeiner Geschichte. In 1780 the first volume (extending to 1388) of his Geschichten der Schweizer appeared, nominally at Boston (to avoid the censor), though really at Bern; and it was well received. In 1781 he published at Berlin, in French, his Essais historiques. He was on his way back to Switzerland when the lawyer Troschel, friend of Hesse and professor of history, he had played at Cassel till 1783, publishing his Recherches sur les CONDITIONS of a book wherein certain leanings towards Romanism are visible. On his return to Geneva (1783) he accepted the post of reader to the brother of his old patron, Tronchin, and occupied himself with remodelling his published work of 1780. In order to improve his financial position, he accepted early in 1786 the post of librarian to the elector-archbishop of Mainz, who bestowed many important offices upon him and obtained his elevation to nobility from the emperor in 1791. In June 1786 he issued vol. i. (reaching to 1412) and two years later vol. ii. (to 1436) of this work. These volumes were printed in a form in which they were received with great praise. In 1787 he issued an important political tract, Zur Darstellung des Fürstenbundes. But in October 1792 Mainz was taken by the French, so that Müller had to seek for another post. In February 1793 he entered the service of the emperor as an imperial aulic councillor. At Vienna he spent many years, becoming chief librarian of the imperial library in 1808, and in 1795 he issued vol. iii. (to 1445) of his Swiss history. In 1804 he became historiographer, war councillor, and member of the Academy at Berlin. In 1805 vol. iv. (to 1475) appeared. But in 1806 he became strongly inclined towards Napoleon, by whom he was received in audience (Nov. 1806), and from whom he accepted (end of 1807) the office of secretary of state for the kingdom of Westphalia, exchanging this position early in 1808 for the posts of privy councillor and general director of public instruction. At the end of 1808 he published vol. v. (to 1485) of his great work. He died at Cassel on the 29th of May 1809. His Swiss History now possesses a literary value only, but it was an excellent work in every way for the 18th century.

Müller's works were published under the care of his brother at Tübingen, where he died on the 1st of April 1809, and his name was carried on at Stuttgart (1831–1855). The Swiss History was re-issued at Leipzig and Zürich, in 18 vols. (1824–1853), with continuations by Glutz (1826–1851). In 1857, Historical (1851), Vullemain (1712), and Monnard (1815). A French translation was printed in the German edition (as above) appeared, in 18 vols., at Paris and Geneva (1837–1851). See the bibliographies by Heeren (1809), Döring (1839) and Monnard (1851), and also the Table of Contents of the French edition of the Schweiz (Zürich, 1856), pp. 305–311, and in the Festschrift der Stadt Schaffhausen (Schaffhausen, 1801), pt. v. pp. 83–99. F. Schwarz's pamphlet, J. von Müller and seine Schweizergeschichte (Bäle, 1884), traces the genesis of the History. Müller's letters to Füsslin (1771–1807) were issued at Zürich (1812), and those to Ch. Bonnet, &c., at Stuttgart (1835). Those addressed to him by various friends were published by Mauren-Constant, in 6 vols. (Schaffhausen, 1839–1840); and those written to him (1789–1809) by his brother, G. Müller, appeared, under the editorship of E. Haug, at Frauenfeld, in 2 vols. (1891–1892).

MÜLLER, JULIUS (1801–1878), German Protestant theologian, was born at Brieg on the 10th of April 1801. He studied at Breslau, Göttingen and Berlin, first law, then theology; and in 1839 became professor ordinarius of theology at Halle (1839). In 1849 he helped to found the Deutsch-evangelischen Kirchenrat, and two years later founded and edited (1850–1861), with Neander and K. J. Nitzsch, the Deutsche Zeitschrift für Christliche Wissenschaft und christliches Leben. He died at Halle on the 27th of September 1878. A disciple of Neander and friend of Richard Rothe, Müller bitterly opposed the philosophy of Hegel and the criticism of F. C. Baur. His book, Über den Gegensatz des Protestantismus und des Catholicismus (1833), called forth a reply from Baur, and he was one of those who attacked D. Strauss's Life of Jesus. In 1846 he had been deputed to attend the General Evangelical Synod at Berlin. Here he supported the Consensus-Union, and afterwards defended

W. A. B. C.
MÜLLER, K. O.—MÜLLER, W. J.

himself in the pamphlets *Die erste Generalsynode der evang. Landeskirche Preussen* (1847) and *Die evangelische Union, ihr Wesen und göttliches Recht* (1854). His chief work, however, was *Die christliche Lehre der Schwester* (1855; 5th ed., 1867; Eng. trans. from 5th ed., in which he carried scholarship so far as “to revive the ancient Gnostic theory of the fall of man before all time, a theory which found no favour amongst his theological friends” (Otto Pfleiderer).

Müller’s other works include *Dogmat. Abhandlungen* (1850), and *Das christliche Leben* (3rd ed., 1847). See M. Kähler, Julius Müller (1828); L. Schultze, Julius Müller (1879) and Julius Müller als Ethiker (1895).

MÜLLER, KARL OTFRIED (1797–1840), German scholar, was born at Brieg in Silesia on the 28th of August 1797. He was educated partly in Breslau, partly in Berlin, where his enthusiasm for the study of Greek literature, art and history was fostered by the influence of Böckh. In 1827, after the publication of his first work, *Aegyptiaca liber*, he received an appointment at the Magdaleneum in Breslau, and in 1839 he was made a professor of ancient literature in the university of Göttingen, his subject being the archaeology and history of ancient art. His aim was to form a vivid conception of Greek life as a whole; and his books and lectures marked an epoch in the development of Hellenic studies. Müller’s position at Göttingen being rendered unpleasant by the political troubles which followed the accession of Ernest Augustus (duke of Cumberland) to the throne of Hanover in 1837, he applied for permission to travel; and in 1839 he left Germany. In April of the following year he reached Greece, having spent the winter in Italy. He investigated the ancient ruins of Greece, visited many places of interest in Peloponnese, and finally went to Delphi, where he began excavations. He was attacked by intermittent fever, of which he died at Athens on the 1st of August 1840.

Among his historical works the foremost place belongs to his *Geschichten kellenischer Stämme und Städte: Orchemos und die Minyer* (1826), and *Die Dorier* (1824; Eng. trans. by H. Tufnell and Cornwell Lewis, 1830, including the essay Übers die Makedonier, on the settlements, origin and early history of the Macedonians). He introduced a new standard of accuracy in the cartography of ancient Greece. In 1828 he published *Die Etruskische Sprache*, and in 1839 *Histoire d’un voyage au pays des Phéniciens*, and *Histoire d’un voyage au pays des Syriens*. His *Prolegomena zu einer wissenschaftlichen Mythologie* (1825; Eng. trans., J. Leitch, 1844), in which he avoided the extreme views of G. F. Creuzer and C. A. Lobbeck, prepared the way for the scientific investigation of myths; while the study of ancient art was promoted by his *Handbuch der Archäologie der Kunst* (1839; Eng. trans., J. Leitch, 1847), and *Denkäußer der alten Kunst* (1833), which he wrote in association with C. Osterley. In 1840 appeared in England his *History of the Literature of Ancient Greece*, the original German work from which it had been translated and issued in Germany in 1841 (4th ed. by H. Heitz, 1852).

Müller’s chief publications were: *C. Lucullus satuarum reliqua* (1825), including the fragments of Access and Susius; *Leben und Werke des Gaius Lucullus* (1827; Eng. trans., A. J. H. Henderson, 1830); *Horace* (1829; 3rd ed., 1837); Quintus Horatius Flaccus, a letter-historische Biographie (1830); Quintus Ennius (1834), an introduction to the study of Roman poetry; *O. Ennius continum reliquiae* (1831); *Livius Andronicus* et Ca. Naevii fabularum reliquiae (1835); *Satyrische Vers und seine Denkmüller* (1836); *Noni Marcelli compendiosa* (1836); *De Pacuvii fabulis* (1839); *De Aecii fabulis* (1840).

MÜLLER, WILHELM (1794–1827), German lyric poet, was born at Dessau on the 7th of October 1794, the son of a shoe-maker. He was educated at the gymnasion of his native town and at the university of Berlin, where he devoted himself to philological and historical studies. In 1813–1814 he took part, as a volunteer, in the national rising against Napoleon. In 1817 he visited Italy, and in 1820 published his impressions in *Rom, Römer und Römervinnen*. In 1818 he was appointed teacher of classics in the Dessau school, and in 1820 librarian to the university library. He died at Dessau on the 30th of September 1827. Müller’s earliest lyrics are contained in a volume of poems, *Bundesbütlen*, by several friends, which was published in 1816. His literary reputation was made by the *Gedichte aus den hinterlassenen Papieren eines reisenden Waldhornisten* (2vols, 1821–1824), and the *Lieder der Griechen* (1821–1824). The latter collection was Germany’s chief tribute of sympathy to the Greeks in their struggle against the Turkish yoke, a theme which inspired many poets of the time. Two volumes of *Neuzeitische Volksscheren* and *Lyrische Reisen und epigrammatische Spaziergänge*, followed in 1825 and 1827. Müller also wrote a book on the *Homericische Sceuthe* (1824; 2nd ed., 1830), translated Marlowe’s *Faustus*, and edited a *Bibliotheck der Dichtungen des 17. Jahrhunderts* (1822–1827; 10 vols). His poetic genius was kindred to that of the composer Schubert, who set many of his lyrics to music.

Wilhelm Müller’s *Gedichte* were first collected in 1837 (4th ed., 1886), edited by his son, F. Max Müller (1868); there are also posthumous editions of more recent composition, one in Reimarus’s *Gedichte* (1844); critical edition by J. T. Hatfield (1906). Müller’s *Vermischte Schriften* were edited with a biography by G. Schwab (2vols, 1827–1830). Müller’s *Godey’s Universal système de l’alphabetique historique*; *Franck, Zur Biographie des Dichters W. Müller* (Mitteilungen des Vereins für anhaltische Geschichte, 1887); J. T. Hatfield, "W. Mülers unveröffentlichtes Tagebuch und seine ungedruckten Briefe" (Deutsche Rundschau, 1907).

MÜLLER, WILLIAM JAMES (1812–1845). English landscape and figure painter, was born at Bristol on the 28th of June 1812, his father, a Prussian, being curator of the museum. He first studied painting under J. B. Pyne. His early subjects deal mainly with the scenery of Gloucestershire and Wales, and he learned much from his study of Claude, Rysdael, and earlier landscape-painters. In 1833 he figured for the first time in the Royal Academy with his "Destruction of Old London Bridge—Morning," and next year he made a tour through France, Switzerland and Italy. Four years later he visited Athens, extending his travels to Egypt, and in the succeeding year executed during this period and the paintings produced from them his power and individuality are apparent. Shortly after his return he left Bristol and settled in London, where he exhibited regularly. In 1840 he again visited France, where he executed a series of sketches of Renaissance architecture, twenty-five of which were lithographed and published in 1841, in a folio entitled *The Age of Francis I. of France*. In 1843 he accompanied, at his own request and his own charges, the government
MULLET—MULLION

expedition to Lycia, where he made a number of masterly sketches. He died at Bristol on the 8th of September 1843.

The print room of the British Museum possesses, through the bequest of Mr John Henderson, a rich collection of Muller's sketches. A biography by N. Neal Solly was published in 1875.

MULLET, the name of two different kinds of fishes, distinguishing red mullets and grey mullets.

Red mullets (genus Mullus, the name given by the ancient Romans) are marine fishes, with two short dorsal fins remote from each other; the first is composed of feeble spines, the second of branched rays; the anal fin is similar to the second dorsal. The body is covered with large thin scales. The form of the head is peculiar; its anterior profile slopes downwards to the small mouth, which has very small and feeble teeth, and from which two cylindrical barbels are suspended. These organs of touch are generally laid backwards and hidden in a groove between the branches of the lower jaw, but can be erected and called into action independently. About forty different species of red mullets are known, chiefly from the tropical and sub-tropical parts of the Indo-Pacific ocean. In European waters two forms are known which have received different specific names. Mullus surmuletus and Mullus barbatus. The former in addition to the general red colour has three to five bright yellow bands along the sides from head to tail; these are absent in the other form. It has been proved that this is not a sexual difference, the two forms are varieties or species. The striped form has a greater value than the plain form, which is rare or absent. In the Mediterranean both kinds occur, but it is probable that the striped form, which is larger, is more common in the Atlantic and the plain form in Mediterranean and southern waters.

Red mullets do not attain any considerable size, the largest of the tropical species weighing only two or three pounds. They are ground-feeders, evidently using their barbels in discovering their food, which consists of crustacea, worms, and, in the larger species, of small fishes; that they feed on putrid flesh is not borne out by the evidence drawn from their feeble jaws and dentition, but it is probable that they are attracted to a decomposing body by the presence of the small crustaceans which feast upon it. Although the colours of these fishes are brilliant, they are simple and evanescent; only a few of the tropical species exhibit ornamentations in the form of black spots or bands. In many, as also in the European species, red colour prevails, and its preservation after death is considered to enhance the fitness of the fish for the table, and consequently its market value. To produce the intensity of this red colour, fisherman scale the red mullet immediately before its death, a process in which the red pigment cells or chromatophores are excited to expand; fishes which are allowed to die in the water show little red, and therefore red mullets caught by the trawl are less valuable than those obtained in a trammel-net, by which the majority are secured alive. All the species are esteemed as food; but none equals the European species, which was held in exaggerated esteem by the gourmards of Rome. They exhibited the living fish and allowed them to die at the table immediately before they were consigned to the cook; they kept them in large reservoirs until they were wanted, and paid fabulous prices for fishes which to the average person are of no account. The habits of red mullets; during winter they retire into deep water, late in spring and during summer they approach the coasts and enter even brackish water, but the state of their sexual organs shows that they do not come towards the shore to breed. At Naples they spawn from May to August, and their eggs are buoyant and transparent. In June, July and August the young are about an inch long, and already furnished with the two barbels.

The grey mullets form a widely different and distinct family, Mugilidae. They are not exclusively marine, but enter brackish water, live always close to the shore, and some of the tropical forms inhabit the pure fresh water of streams and rivulets, without, however, penetrating far inland. Their body is elegantly formed, wedge-shaped, and covered with scales of moderate size, firmly adherent to the skin. The two short dorsal fins are remote from each other, and the anterior is composed of four stiff spines. The anal fin is similar to the second dorsal; the caudal fin strong and bilobed. The form of the snout is peculiar; the mouth narrow, transverse in the Mediterranean, and, in the northern species; seventy different species are known, from almost every coast of the temperate and tropical zones; they swim in small schools and are abundant wherever they occur. Two species are found on the British coasts—Mugil capito and Mugil chelo, the first being the more common. Some of the fresh-water grey mullets of the tropics, especially those of the West Indian and Indo-Pacific regions, have the mouth more lateral or have distinct though minute teeth; they therefore have been formed into separate genera, Agonostoma and Myceus.

Mullets, at least some of the species, grow to a weight of 10 or 12 lb; but the fish which usually come into the market rarely exceed half that weight. Those in which distinct teeth are developed feed principally on small aquatic animals, whilst the diet of those without teeth consists of animals or minute organic substances mixed with the mud or sand which they swallow in large quantities; also confervoid growths to which small shells adhere are freely taken. To prevent the gills from being clogged by sand or mud, a peculiar apparatus separates these organs from the pharynx. Each branchial arch is provided on each side, in its whole length, with a series of closely-set gill-rakers, each series fitting into the series of the adjoining arch; they constitute together a sieve permitting the passage of the water, while retaining other substances in the cavity destined for mastication. The structure of the intestinal tract is also adapted to the diet of these fishes. One portion of the stomach is globular and surrounded by a thick mass of muscles, the cavity being small and coated with a tough epithelium. This structure reminds us of the stomach of birds, in which it also serves for the triturating of hard substances. The intestine itself is six or seven times as long as the fish. Grey mullets are plainly coloured, generally greenish on the upper parts and more or less silvery on the side. They are wholesome food, well flavoured when taken out of clean water. In the fish-farms of western Italy grey mullets are among the principal fish cultivated.

MULLIGATAWNY, the name, derived from the Tamil muligatu-tannir (i.e. pepper water), given to a favourite hot East Indian soup, made with curry-powder and otherwise highly seasoned, and served usually with rice.

MULLINGAR, a market-town, and the county town of county Westmeath, Ireland, near the river Brosna and on the Royal canal, 50 m. W. by N. of Dublin. Pop. (1901), 4500. It is a junction on the Midland Great Western railway where the branch for Longford, Sligo and Cavan leaves the main line. The principal churches are the parish church (1813) with tower and spire, and the Roman Catholic cathedral for the diocese of Meath. The town was the headquarters of William III. before the siege of Athlone. It formerly returned two members to parliament, but was disfranchised at the Union in 1800. Mullingar is a centre for the trout-fishing in the Westmeath loughs, being in proximity to Loughs Ennell and Owel.

MULLION (corrupted from "munnion"); this is derived from Fr. mouignon, stump), in architecture, the English term for the perpendicular pieces of stone, sometimes like columns, sometimes like slender piers, which divide the bays or lights of windows or screen work from each other; equivalents are Fr. meurou, Ital. regole, Ger. Fensterfeste. H. Wedgwood ("Dict. of Eng. Etym.") points out that the mullion is "the stump of the division before it breaks out into the traceray of the window.

In all styles, in less important work, the mullions are often
simply plain chambered, and more commonly have a flat hollow on each side. In larger buildings there is often a bread or bowtell on the edge, and often a single small column with a capital; these are more frequent in foreign work than in English. Instead of the bowtell they often finish with a series of double ogives. The tracery grew richer, the windows were divided by a larger order of mullion, between which came a lesser or subordinate set of mullions, which ran into each other.

MÜLLNER, AMANDUS GOTTFRIED ADOLF (1774–1829), German dramatic poet, nephew of Gottfried August Bürger, (q.v.), was born at Langendorf near Weissenfels on the 15th of October 1774. After studying law at Leipzig he established himself as advocate at Weissenfels and made his début as an author with a novel Ungeist, oder der Schatzgeist von Aegypten (1790). He next wrote a few comedies for an amateur theatre in Weissenfels; these were followed by more pretentious pieces: Der englische Kater (1800) and Der Blüte (1814, publ. 1818), after French models. With his tragedies, however, Der neunundzwanzigste Februar (1812), and especially Die Schuld (1813; publ. 1876), Müllner became the representative of the so-called Schicksalsdramatiker, and for several years "fate-tragedies" on the model of Die Schuld dominated the German stage. His later plays, König Yungur (1817) and Die Alkohoserin (1820), were less successful. With a view to literary success, Müllner did not neglect his profession, and was given the post of Hofrat; he also edited various journals, and had a reputation as a vigorous if somewhat acrimonious critic. He died at Weissenfels on the 11th of June 1829.

Müllner's Vormischte Schriften appeared in 2 vols. (1824–1826); his Dramatische Werke in 8 vols. (1828; 2nd ed., 1832). In 1830 four supplementary volumes were published containing mainly criticism. See F. K. J. Schütz, Müllners Leben, Charakter und Geist (1830); J. Minor, Die Schicksalsdramatiker in ihren Hauptvertretern (1883), and the same author's volume, "Das Schicksalsdrama" (1884), in Kirchinger's Deutsche Nationalliteratur, vol. 151.

MULOCK, SIR WILLIAM (1843— ), Canadian statesman and jurist, was born at Bond Head, Ontario, on the 19th of January 1843, the son of T. H. Mulock, M.D. From 1862 to 1865 he was a prominent member of the Liberal party in the Federal house; postmaster-general from 1896 to 1905, and minister of labour from 1900 to 1905. He introduced many improvements into the Canadian postal service, and in 1898 in face of much opposition induced the Inter-Imperial Postal Convention to adopt the principle of penny postage within the British Empire. In 1905 he resigned office, and was appointed chief justice of the eastern division of the Supreme Court of the province of Ontario. From 1881 to 1900 he was vice-chancellor of the university of Toronto, and was largely responsible for the success of the movement leading to the federation between that body and the Victoria University (Methodist).

MULREADY, WILLIAM (1786–1863), English subject painter, was born at Ennis, Co. Clare, on the 30th of April 1786. When he was about five years old his father, a leather-breeches maker by trade, removed to London, where the son received a tolerable education, chiefly under Catholic priests. He was fond of reading, and fonder still of drawing.1 When eleven years old Mulready was employed by an artist named Graham as the model for a figure in his picture of "Solomon blessed by his Father David." The painter's interest in the lad did much to confirm his artistic proclivities; and, having studied at home for two years, Mulready applied for advice to Banks the sculptor, who sent him to a drawing school and permitted him to work in his own studio. In 1800 he was admitted a student of the Academy, and two years later he gained the silver palm with a picture of the envoy. About this time he was associated with John Varley, the eccentric water-colour painter and drawing-master, whom he assisted in the tuition of his pupils, who included Cox, Fielding, Linnell, William Hunt, and Turner of Oxford. At eighteen he married a sister of Varley's, and at twenty-four he was the father of four sons. The marriage was unhappy, and the pair separated before many years. He "tried his hand at everything," as he said, "from a miniature to a panorama." He painted portraits, taught drawing, and wrote essays, he designed illustrations to a series of children's penny books. His first pictures were classical and religious, but soon discovered his special aptitude for genre-painting, and in 1829 produced the "Carpenter's Shop," and in 1831 the "Barber's Shop," pictures influenced by the example of Wilkie and the Dutch painters. In 1813 he exhibited his "Punch," a more original and spontaneous work, which brought the artist into notice, and two years later his "Idle Boys" procured his election as associate. Next year he received full academic honours, and the election was justified by the "Fight Interrupted" which he then exhibited. It was followed by the "Wolf and the Lamb" (1820), the "Convalescent" (1822), "Interior of an English Cottage" (1828), "Dogs of Two Minds" (1830), the "Seven Ages" (1838), and in 1839 and 1840 by the "Sonnet and First Love," two of the most perfect and poetical of the artist's works. In 1840 he designed an allegorically covered postal envelope (the "Mulready envelope," soon discontinued) for Rowland Hill, and a set of designs for the "Warkfield," a celebrated cottage which were succeeded by his paintings of the "Whistling Convent," "Choosing the Wedding Gown" (1846), and "Sophia and Burchell Haymaking" (1849). His later works, like the "Bathers" (1849), "Mother teaching her Children" (1859), and the "Toy Seller" (1862), show declining powers, mainly attributable to failing health. The last evening of his life was spent at a meeting of the Academy, of which, for nearly fifty years, he had been a most active and efficient member. He died of heart disease on the 7th of July 1863.

Mulock or Mooltan is the northern division of British India, in the Punjab. The city is 4 m. from the left bank of the Chenab, near the ancient confluence of the Ravi with that river. It has a station on the North-Western railway. Pop. (1901), 87,394. The city is enclosed on three sides by a wall, but open towards the south, where the dry bed of the old Ravi intervenes between the houses and the citadel. Large and irregular suburbs have grown up outside the wall since the annexation in 1849. Within the city proper, narrow and tortuous streets, often ending in cula de sac, fill almost the whole space; but one broad bazaar runs from end to end. The principal buildings include the shrines of two Mahomedan saints and the remains of an ancient Hindu temple. The cantonments form the head-quarters of a brigade in the 3rd division of the northern army. Multan has manufactures of carpets, silk and cotton goods, shoes, glazed pottery and enamelled work, and an annual horse fair. It is moreover one of the most important trade-centres in the Punjab. It is a station of the Church Missionary Society.

The DISTRICT of MULTAN occupies the lower angle of the Bari Doab, or tract between the Sutlej and the Chenab, with an extent across the Ravi. Area, 6105 sq. m. The population in 1901 was 710,626, showing an increase of 11.7% in the preceding decade, due to the extension of irrigation. The principal crops are wheat, millets, pulse, oil-seeds, cotton and indigo. There are factories for ginning and pressing cotton. Indigo is made only by native processes. Irrigation is largely conducted by inundation channels from the boundary rivers, but the centre of the district is barren. The district is traversed by the main line of the North-Western railway from Lahore,
MULTIPLEPOINDING—MUMMIUS

which crosses the Sutlej by the Empress Bridge opposite Bahawalpur. It is also entered by the branch from Lyallpur to Khanewal junction, crossing the Ravi.

The early Arab geographers mention Multan as forming part of the kingdom of Sind, which was conquered for the caliphate by Mahommel bin Kasim in the middle of the 8th century. On the dismemberment of the Mogul Empire in the middle of the 18th century, Multan fell to the Afghans, who held it with difficulty against the Sikhs. At length, in 1818, Ranjit Singh after a long siege carried the capital by storm; and in 1821 he made over the administration of Multan with five neighbouring districts to Sawan Mal, who raised the province to a state of prosperity by excavating canals and inducing new inhabitants to settle. After the establishment of the council of regency of Lahore, difficulties arose between Multaj, son and successor of Sawan Mal, and the British officials, which led to his rebellion, and culminated in the second war and the annexation of the whole of the Punjab. The city of Multan, after a stubborn defence, was carried by storm in January 1849. The district at once passed under direct British rule, and order was not disturbed even during the Mutiny.

The Division of Multan is the south-western division of the Punjab. It was abolished in 1884, but reconstituted in 1901. Its area is 29,516 sq. m. and its population in 1901 was 5,014,675. It includes the six districts of Mainwalli, Jhang, Lyallpur, Multan, Muzaafargarh, and Dera Ghazi Khan.

MULTITUBERCULATA, in Scott's law, the technical term for a form of action by which conflicting claims to the same fund or property are determined. The action is brought either by the holder or by a claimant in his name. All who have any claims in the fund or property in question are ordered to appear and give in their claims; the court then prefers them according to their respective rights, and the holder of the fund or property in dispute on payment or delivery is absolved from any further claim in regard to it. It corresponds to the process of inter-pleader in English law.

MULTITUBERCULATA, a group of extinct mammals, mostly of present size, whose remains are met with in strata ranging from the Trias to the Eocene, both in Europe and in North America. They are mostly known by their lower jaws, and take their name from the fact that the grinding teeth (fig. 2, m. 1 and 2; and fig. 3 a. b. c.) bear two or three longitudinal rows of tubercles, or are provided with tubercles round the edges. From this feature these otherwise unknown animals are believed to be related to the existing egg-laying mammals (duck-billed platypus and spiny ant-eater), constituting the order Monotremata, and are therefore provisionally placed near that group. The largest representative of the Multituberculata is *Polynastodon* from the Lower Eocene of New Mexico; the same beds also yield the smaller *Poliodon*; while from corresponding strata at Rheims, in France, has been obtained the nearly allied *Neoplagiatus*. The latter takes its name from its resemblance to *Plagiatus* (figs. 1 and 2) from the Purbeck strata of Swanage, Dorsetshire, which was one of the first-known members of the group. These have cutting teeth in front and multituberculate molars behind. *Aludon* and *Clenacodon* represent the group in the Cretaceous of North America; and the English Purbeck genus *Bolodon*, in which all the cheek-teeth are multituberculate, also belongs here. *Stereognathus* (fig. 3) is another English Upper Oolitic type. Single teeth from the Rhætic of England and Württemberg described as *Microlestes* apparently indicate the earliest member of the group. A skull from the Upper Triassic Karoo beds of South Africa described as *Tritylodon longaeus*, which has multituberculate molar teeth, was also at first placed in this group, but has been subsequently regarded as a reptile, although Dr R. Broom considers that the original determination is correct. Possibly a fore-limb from the same formation described as *Thoridesmus phylarchus* indicates a similar or allied animal. Not improbably *Tritylodon* indicates a direct link between the multituberculate mammals and the anomodont reptiles of the Permian and Trias.

MUMMERS, bands of men and women in medieval and later England and elsewhere, who, during periods of public festivity, particularly at Christmas, dressed in fantastic clothes and wearing masks or disguised as animals, serenaded the people outside their houses or joined in the revels within. In a more restricted sense the term is applied to the actors in the old English rural folk-plays of St George, &c.; and "mummery" thus becomes a contemptuous synonym for any form of stage-playing. The origin of the word mummer (older spelling "mummer," Fr. *moumeur*) is not satisfactorily explained; but the verb "to mum" means both to mudder and to be silent, and "mummer" apparently comes from one or both of these senses. Mumming seems to have been a survival of the Roman custom of masquerading during the annual orgies of the Saturnalia. "The disguising and mumming that is used in Christmastyme" Langley writes in his synopsis of Polydore Virgil, "in the North parts came out of the feast of Pallas, that were done with vsars and painted visages, named Quinquatria of the Romanyes." Aubanuus, writing of mumming in Germany, says that "in the Saturnalia there were frequent and luxurious feasting among friends, presents were mutually sent, and changes of dress made: that Christians have adopted the same customs, which continue to be used from the Nativity to the Epiphany: that exchanges of dress too, as of old among the Romans, are common, and neighbours by mutual invitation visit each other in the manner which the Germans call mumpering." Christmas was the grand season for mumming in England. Some were disguised as bears, others as unicorns, or wore deer's hide and antler's or ram's horns. Mumming led to such outrages that Henry VIII. issued a proclamation declaring the wearing of a mask or disguise a misdemeanour. Stow gives an account of an elaborate mummary held in 1377 by the London citizens to amuse the son of the Black Prince, then living at Kennington (Surrey, 1603, p. 97). In Scotland, where mumming still exists at Christmas, Hogmanay, New Year's Day and Haudsela Monday, mummers are called "guisars." They usually present on these four days, as a rude drama called *Galaunet*, which, in various versions, is common throughout the Lowlands of Scotland (see Chambers's *Popular Rhymes*, p. 170).

MUMMIUS, LUCIUS (2nd century B.C.), surnamed Achaicus, Roman statesman and general. Consul in 146 B.C. Mummius was appointed to take command of the Achaean War, and having obtained an easy victory over the incapable Dicaeus, entered Corinth unopposed. All the men, women, and children were put to the sword, the statues, paintings and works of art were seized and shipped to Rome, and then the place was reduced to ashes. The apparently needless cruelty of Mummius in Corinth, by no means characteristic of him, is explained by Mommsen as due to the instructions of the senate, prompted by the mercantile party, which was eager to get rid of a dangerous commercial rival. According to Polybius, his inability to resist the pressure

of those around him was responsible for it. In the subsequent settlement of affairs, Mummius exhibited considerable administrative powers and a high degree of justice and integrity, which gained him the respect of the inhabitants. He specially abstained from offending their religious susceptibilities. On his return to Rome he was honoured with a triumph. In 142 he was censor with the younger Scipio Africanus, whose severity frequently brought him into collision with his more lenient colleague. Mummius was the first novus homo of plebeian origin who received a distinctive cognomen for military services. His indifference to works of art and ignorance of their value is shown by the fact that he paid no regard to those who offered for the shipment of the treasures of Corinth to Rome, that "if they lost or damaged them, they would have to replace them." For the theatrical pageants exhibited by him he erected a theatre with improved acoustical conditions and seats after the Greek model, thus marking a distinct advance in the construction of places of entertainment.

His brother, SPURIUS MUMMIUS, a man of greater refinement and intellectual powers, accompanied Lucius as his legate to Achaea, whence he sent letters to his friends at Rome, describing his experiences in humorous verse. These letters, which were still popular a hundred years later, were the first example of a distinct class of Roman poetry—the poetic epistle. Both he and his brother are alluded to by Cicero as mediocre orators, whose style was simple and old-fashioned, although Lucius, as a Stoic, was more concise.

MUMMY (from the Persian mumia, pitch or asphalt), a dead body, as preserved by the ancient Egyptian method of embalming. The preservative climate of Upper Egypt and the belief of the Egyptians in life after death must be the causes which led them to take unusual care for preserving the bodies of their dead. In prehistoric times in Egypt the dead were laid in the graves on mats in the crouching position common in the burials of primitive peoples, and were supplied with jars of food, flint instruments, &c. Perhaps the attempt was already made to preserve the bodies by drying or otherwise. In a few instances, such bodies, probably more than five thousand years old, have been found with skin and hair well preserved though dried and shrunk; usually everything but the bones has decayed. With the advent of the Dynasties the bodies of some of the principal people were found lying extended at full length. By the time of the VIth Dynasty it was usual to lay the corpse on its left side in the attitude of sleep, and a wooden coffin was often provided upon which were inscribed magic formulae that had already been employed for ages in ritual. In the Middle Kingdom necropolis of Beni Hasan, Garstang found many intact interments in coffins, and in one case the body was well preserved. Several were accompanied by boxes divided into four compartments and inscribed with the names of the four deities who represented the internal organs of the body. This indicates that the custom of taking out these organs and wrapping them separately was already in vogue in the most lavish form of burial. But the parcels, examined by an expert, contained no trace of organic remains, proving how much the Egyptians depended on magic imitations and make-believe. It was not until the New Kingdom that the processes of embalming reached a high degree of elaboration. Later still, in the last millennium B.C., it seems that even the bodies of the poor were pickled. The embalmers were accustomed to keep the corpse in all for seventy days before burial (cf. Gen. i. 3; Herod. ii. 80), to be soaked, wrapped in linen bandages, and put in the coffin. This is confirmed by the monuments as far back as the age of Rameses II. (c. 1300 B.C.) and may be conjectured to have been established still earlier.

The Egyptians did not stop at the mummification of the human body; sacred animals, birds, reptiles, fishes, and even insects were treated in a similar way, and the meat offerings deposited with the wealthy dead were likewise "preserved." Vast cemeteries of animals which belonged to the revered species have been discovered; more especially may be mentioned that of the cats at Bubastis, the remains of which, charred by some great fire, until recently filled numberless chambers of crude brick in the ruins at Zagazig. In the hawk cemeteries birds were embalmed in long bundles, forming sometimes an assortment that is not without incongruities from the naturalist's point of view. From a few of these bundles may be extracted not only numbers of raptorial birds, large and small, including owls, but also the hawk-like cuckoo, the shrike, and even the swallow. The larger animals were represented in mummies by the head and a selection of the bones. Bones of bulls and male calves, especially crania, were collected and formed into huge ox-like mummmies.

What the Egyptians really thought of mummification can only be partially inferred, but even in the distant past, from century to century, governed their practice, and no doubt was regulated by the priests. At first the luxury of mumification was reserved for the king, who was identified with Osiris and was buried with an abundance of ritual and magic words. But the king required his courtiers, and his courtiers in turn needed their servants in permanent attendance. Partly in consequence of this, the deification of the king, with all its concomitants, was gradually extended through the ranks of theable and wealthy within the reach of the humblest, and even animals shared the honour of burial. Finally, in a papyrus of the Roman age, the word "god" is practically defined as "buried," i.e. with due rites. Beliefs regarding the gods and life after death were self-contradictory and variable, but none interfered with the custom of preserving the body. It was always the prayer that the soul (bai) should be able to revisit the corpse (bkh), and some inscriptions show an expectation of the body (itself being revived, "the mouth speaking," "the legs walking," and everything conforming with its previous terrestrial life. At the same time the ko ("life," "activity," and almost "ghost," which clung to the neighbourhood of the tomb and enjoyed the ghosts of offerings in ghostly fashion, had some of the independent enterprise which the bai possessed in abundance. The mumified corpse as a divine thing—not the mere bkh (from the sans (an old word meaning "noble") or tkh, which in the latter period meant a spirit or demon. As the corpse was found generally to disappear and decay in spite of preservative magic, especially in the early ages, various substitutes were resorted to; statues and statuettes were thought efficacious, but, apart from their costliness, even these were subject to decay or destruction by violence, and in the absence of anything more substantial the Egyptians doubtless reflected that magic words alone in the last resort made everything right.

Under the Old Kingdom the attendance on and services for a dead magistrate—the sacrifices and libations at his tomb—were left, together with endowments, to a staff of priests, called "servants of the ko (ka)," whose offices were hereditary. This system led to disputes and neglect, and was so unworkable that we find in the texts of the Middle Kingdom the whole responsibility put upon one well-endowed "ko-servant," who passed on his office to a single heir. How these things were managed during the New Kingdom we do not know. In the last thousand years B.C. the life of the Egyptians consisted largely in every kind of religious and superstitious observances. Papyri of the Ptolemaic age or somewhat earlier afford much information about the people of the necropolis. In this age the choakhtye, as the Greeks called them ("libation priests," or "shrine openers" in Egyptian), belonged to an inferior grade of the priesthood, equivalent to the gastophori of the deities, and were organized in gilds for the different cemeteries. A single choakhtye would have an interest, not always the sole interest, in a large number of mummies, and these interests could be disposed of by will or contract, bought and sold. The taricheutae, or embalmers, had no permanent interest in the mummies they preserved.

Thanks to the great care expended on the preservation of the royal dead, although the mummies of all the other kings have disappeared, a wonderful series of the Theban kings and queens of the New Kingdom from the XVIIth Dynasty to the XXIst
MUMPS

Dynasty has come down to us. It comprises some of the most notable figures in Egyptian history—Ahmos (Amasis I), who freed Egypt from the Hyksos, Tethmosis I and III., the conquerors of Syria and makers of the empire, Amenophis III, the great builder, whose likeness is preserved in the colossi of Memnon, probably also his son, Amenophis IV. (Akhenaton), the heretic king, and Seti (Setkos) I. and his son Ramesses II. The mummy of Seti I. is in the finest possible preservation, but others, after being brutally plundered, were rewrapped by the piety of later generations.

In Lower Egypt practically all the mummies have perished; but in Upper Egypt, as they were put out of reach of the inundation, the cemeteries, in spite of rioting and burning, yield immense numbers of preserved bodies and skeletons; attention has from time to time been directed to the scientific examination of these in order to ascertain race, cause of death, traces of accident or disease, and the surgical or medical processes which they had undergone during life, &c. This department of research has been greatly developed by Dr Elliott Smith in Cairo. He has examined not only the more recently found of the royal mummies, but also multitudes of skeletons, &c., which have been brought from the official excavations of the government and from other work. His researches, in particular instances, prove their high importance for the history of disease, for characterization of the races inhabiting Egypt, and in other ways. The cemeteries just south of the First Cataract on a first examination reveal a prehistoric race of Egyptian type, a group of male negro mercenaries, a group of male prisoners executed by hanging during the New Kingdom, while from a necropolis of Christian foreigners of about the 6th century comes the first instance of gout in an ancient body from Egypt. Among the prehistoric people are many female skeletons with a fractured right ulna sustained in wading off blows, and some of these women had died while still wearing splints. Circumcision is traceable on all the male bodies which are in a state to show its effects. The royal mummies furnish evidence of age at death as well as of health and physical character. A series of forty-four mummies of priests and priestesses of the XXIst Dynasty furnished the material for an important monograph. Earlier, the processes of mummification produced a skeleton merely clothed in a dry and shrunken skin. At this time, however, the flesh was replaced by a stuffing of sawdust, sand, or other lasting material, introduced with great skill through a few incisions and apertures, so that the natural forms were completely restored. The heart was left in place, but the liver, lungs, stomach and intestines were pickled and wrapped separately and then restored to the body cavity. Later, the form was reproduced by elaborate external wrappings of the different parts of the body before the final swallowing; later still, in the Ptolemaic age, by coarse padding with plenty of linen and pitch. The XXIst Dynasty marks the highest level of the art. The Christians of the early centuries, looking for corporeal resurrection, avoided the incisions, extraction of organs, &c., practised by their pagan forefathers, and buried the body entire after pickling it in salt. Their stricter leaders, however, objected to a custom which so easily led to the worship of relics and the continuance of pagan observances; and with the advent of Islam embalming fell into disuse.

Outside Egypt mummification was practised amongst the ancient Peruvians, who took advantage of the desiccating atmosphere and salt soil of their caves for preserving the dead in good condition without any embalming process. Among the Guanches of the Canary Islands, however, the Egyptian methods of emptying the body and padding the skin were closely paralleled.

A word may be added about the use of mummy in medicine. The name, as has been pointed out above, is derived from the Persian mumīnī, meaning pitch or asphalt, which substance occurs frequently in the prescriptions of the Greek and Roman medical writers. Medieval physicians in the East conceived the happy idea that the highest virtue would exist in that which had been already employed by the Egyptian priests in preserving the human body. Thus the bituminous and fatty matters found about the mummies and their wrappings were employed as a sovereign remedy, particularly for wounds and contusions, and a brisk trade began in these "exudations" of mummies. This led further to the medicinal use of fragments of the mummies themselves; and, finally, the starting-point was lost sight of, so that the dried or prepared flesh of criminals became one of the standard forms of mummy in the pharmacopoeia. It was not till the 19th century that the importance of mummy in all its forms waned, and in some of the least progressive quarters of central Europe it survived even to the middle of the 19th.

Guillard, La Panne mumificée de l'ancienne Egypte (Lyons, 1903); A. Wiedemann, "Mumie als Heilmittel," in Zeitschrift des Vereins für rheinische und westfälische Volkskunde (1906).

MUMPS (syn. Cynanche parotidea, parotitis; also, "The Branks"), a specific infectious disease characterized by inflammatory swelling of the parotid and other salivary glands, frequently occurring as an epidemic, and affecting mostly young persons. The name "mumps" (O. Eng. "to mump," meaning to sulk) originated, no doubt, in the patient's appearance. The disease generally sets in with symptoms of a cold or catarrh accompanied with slight febrile disturbance; but soon the nature of the ailment is announced by the occurrence of swelling and stiffening in the region of the parotid gland in front of the ear. The swelling speedily increases in size and spreads downwards towards the neck and under the jaw, involving the numerous glands in that locality. The effect is to produce much disfigurement, which becomes still greater should the inflammation spread, as often happens, to the glands on the other side of the face and neck. Pain is present in the swollen parts, but it is seldom severe, nor is there much redness or any tendency to suppuration. There is, however, considerable interference with the acts of mastication and swallowing. After continuing for four or five days the swelling and other symptoms abate, and the parts are soon restored to their normal condition.

During the period of convalescence there occasionally occur some swelling and tenderness in other glands, such as the testicles in males (orchitis), and the mammary or ovarial (oophoritis) in females, and possibly involvement of the pancreas, but these are of short duration and usually of no serious significance. Mumps is in general a mild disease, and requires little treatment beyond a gentle laxative, the application of warm fomentations to the swollen and painful parts, the use of soft food, and rest.
